DR THOMAS M D ANGELO *Queens* This resolution asks that the Medical Society of the State of New York and its component county societies set up a new classification of members known as Junior Membership for Interns Residents, and Assistant Residents in Hospitals. These individuals for an annual individual fee of $5 00 would be eligible to malpractice insurance under the Group Plan

Dr McKay has asked permission to withdraw this resolution without prejudice Your Committee approves the withdrawal of this resolution by Dr McKay without prejudice and I so move

DR. EDWIN A GRIFFIN *Kings* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. W GUERNSEY FREY, JR. *Assistant Secretary*) On one of Dr D Angelo s first recommendations in regard to the districts being redistricted and that that matter be referred to the Council of course the Constitution and By laws of the State Society provide provide for what our districts shall be Are we to consider this as notice of an amendment to the By laws?

DR D ANGELO It is referred to the Council for study

SPEAKER ANDRESEN The Council could introduce such an amendment next year

DR. D ANGELO They would probably refer it to the Planning Committee for further study That is what they are doing now

I move the adoption of the report as a whole

DR. WILLIAM KLEIN *Bronx* I second it

There being no discussion the motion was put to a vote and was unanimously carried

Section 147

Report of the Scientific Awards Committee

SPEAKER ANDRESEN We will go back now for a minute As you remember we called for the report of the Scientific Awards Committee before, and Dr Post was not here Dr Post has now come in and will make that report at this time.

DR. CHARLES D POST, *Onondaga* The Committee has spent considerable time in the Scientific Section The exhibits are of an exceedingly high character, and for that reason the Committee has had considerable trouble in coming to a definite award status However we wish to submit the following report

SCIENTIFIC AWARDS

First Prize Dr Gilbert Dalldorf Albany—Vaccination Against Tuberculosis with BCG Vaccine

Second Prize Dr Lee A Hadley Syracuse—Intervertebral Foramen Studies

Honorable Mention Dr B S Oppenheimer Dr E. T Oppenheimer and Dr A I Stout College of Physicians and Surgeons Columbia University—Sarcomas Induced in Rats by Implanting Cellophane

CLINICAL AWARDS

First Prize Dr William Benham Snow Columbia Presbyterian Medical Center—A Program in Physical Medicine

Second Prize Dr David S Graubard Dr Milton H Waldman, and Dr Raphael W Robertozzi

Reconstruction Hospital, Post-Graduate Medical School and Hospital—Intravenous Procaine
Honorable Mention Dr Harry Wallerstein and Dr Alfred Schwartz, Jewish Memorial Hospital, Morrisania City Hospital, and Queens General Hospital—Management of Erythroblastosis

CHARLES D POST, *Chairman*
JOHN SCUDDER
J L MOOREHEAD

SPEAKER ANDRESEN This is informative, and we thank the Committee for its report

I am informed that the House has to make those awards so a motion would be in order to approve the recommendations and make the awards

DR EZRA A. WOLFF, *Queens* I so move

DR FENWICK BEEKMAN, *Assistant Treasurer* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried.

Section 148 (See 11)

Report of Reference Committee on Report of Council, Part IV Public Health Activities B—Cancer

DR THOMAS H MCGAVACK, *Section Delegate* Your Reference Committee has carefully studied in detail Part IV of the Report of the Council relating to Public Health Activities B and commends the vigorous approach that each Subcommittee has made to its particular task.

The Subcommittee on Cancer has filed a detailed report of its activities and plans, which the Reference Committee recommends for endorsement by the House of Delegates I move the adoption of this part of the report

DR EDWIN A. GRIFFIN, *Kings* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR. MCGAVACK The Subcommittee on Cancer conjointly with the State Department of Health has established fellowships for the postgraduate education and training of physicians in fields related to the control of cancer, and has placed such opportunity within the reach of every physician in the State by communication of full details to the secretary of every county medical society The extent of this work and the scope of lecture program of the Subcommittee on Cancer call for special thanks from the House of Delegates, and the Reference Committee makes this recommendation. I move the adoption of this portion of the report

DR. WILLIAM T BOLAND, *Chemung* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 149

Report of Reference Committee on Report of Council, Part IV Public Health Activities B—BCG Immunization

DR THOMAS H MCGAVACK, *Section Delegate* The BCG Advisory Committee, representing the State Department of Health and the Council Committee on Public Health and Education, is in process of completing a report on the BCG Program. This comprehensive presentation of the subject compiled for the benefit and use of all the physicians of New York State deserves the endorsement of the House of Delegates, and your Reference Committee so recommends

I move the adoption of this part of the report

DR MOSES H KRAKOW, *Bronx* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 150

Report of Reference Committee on Report of Council, Part IV Public Health Activities B—Hard of Hearing and the Deaf

DR THOMAS H MCGAVACK, *Section Delegate* Your Reference Committee duly notes and highly commends the progressive steps taken by the Subcommittee on Hard of Hearing and the Deaf for establishing new hearing centers and their further plans for financing an adequate program for the conservation of hearing

I move the adoption of this part of the report

DR DONALD MALVEN, *Washington* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried.

Section 151

Report of Reference Committee on Report of Council, Part IV Public Health Activities B—Mental Hygiene

DR. THOMAS H MCGAVACK, *Section Delegate* The Subcommittee on Mental Hygiene has made a detailed survey of existing facilities and methods for the care of psychologically and mentally maladjusted ill patients As a result, the members of said committee believe a more comprehensive approach to the entire subject is necessary, particularly in view of current scientific developments in the field of psychiatry and mental hygiene On the basis of this belief, the action of the Subcommittee, approved by the Council, in proposing a nine-membered Mental Health Council of New York State Department of Mental Hygiene deserves the wholehearted endorsement of the House of Delegates, and your Reference Committee requests and recommends the same

I move the adoption of this portion of the report

DR WILLIAM B RAWLS, *New York* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 152

Report of Reference Committee on Report of Council, Part IV Public Health Activities B—Rheumatic Fever

DR THOMAS H. MCGAVACK, *Section Delegate* The newly formed interlocking Subcommittee on Rheumatic Fever is developing plans for advising and assisting the ever increasing number of agencies and groups interested in that disease. Theirs is a praiseworthy program which should receive wholehearted support from the House of Delegates, and the Reference Committee makes such a recommendation

I move the adoption of this part of the report

DR W T BOLAND, *Chemung* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 153 (See 8, 142)

Report of Reference Committee on Report of Council, Part IV Public Health Activities B—Group Practice

DR THOMAS H MCGAVACK, *Section Delegate* The Subcommittee on Group Practice of the Council has filed a rather extensive, informative report con-

cerning existing rules and regulations covering partnerships and groups in practice It has moreover, called attention to problems which must be solved in standardizing this type of cooperative effort among the physicians. Emphasis in this report has also been placed on the importance of maintaining the identity of the individual physician in group and hospital practice

Your Reference Committee strongly recommends that each member of the House of Delegates study this report in complete detail in order that not only *may he be fully informed himself but also that he* may acquaint his constituency concerning this matter which may eventually predetermine the course of the professional life of each one of us For instance some conflicts exist between Principles and Ethics as formulated by the American Medical Association and existing laws in the State of New York. These and other matters need further study, clarification and practical application to the problems of group practice

For these reasons your Reference Committee concurs in the recommendation of the Subcommittee on Group Practice that ' this matter should be given detailed and serious study and further recommends ' that it be referred to the Council for appropriate action

We move the adoption of this part of the report.

DR. SAMUEL Z FREEDMAN *New York* I second it.

There being no discussion the motion was put to a vote and was unanimously carried

Section 154 (*See 58*)

Report of Reference Committee on Report of Council Part IV Premarital Blood Tests

DR. THOMAS H MCGAVACK, *Section Delegate* The following resolution was submitted to the House of Delegates on Monday morning, May 17 by Dr G S Philbrick of the Niagara County Medical Society

'WHEREAS under the present public health law thirty days are allowed in which applicants may apply for a license for marriage and

'WHEREAS after receiving a license for marriage sixty days are allowed for the applicant to exercise his right to use such license, and

'WHEREAS, this gives the applicant ninety days in which he or she may become infected which in effect partially nullifies the benefits of this law therefore be it

'*Resolved*, that this House of Delegates go on record as being in favor of a shorter period of time between examination and consummation of the marriage, and the matter be referred to Council for appropriate action.

Your Reference Committee moves the approval of this resolution by the House of Delegates

DR. HOMER J KNICKERBOCKER, *Ontario* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. MCGAVACK Now your Reference Committee moves the adoption of the report as a whole

DR. WILLIAM KLEIN I second it

There being no discussion the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN Thank you, Dr McGavack

Section 155 (*See 29 86*)

Report of Reference Committee on Reports of Board of Trustees and the Treasurer' Resolution Exempting from Dues Payment by Men in Military Service

DR. IRWIN E. SIRIS *Kings* Concerning the resolution dealing with exemption from dues payment by men in military service introduced by Dr Wolff, *of Queens*

'WHEREAS exemption from payment of county society dues and State Society assessments by members in military service was predicated on temporary service for duration of hostilities and

WHEREAS, hostilities have now terminated and

'WHEREAS almost without exception members in temporary service have returned to civilian practice therefore be it

Resolved that the resolution adopted by this House of Delegates recommending exemption from payment of county society dues and State Society assessments by members in service be declared inoperative as of December 31 1948

We recommend that the resolution be amended to read as follows

A That members of the armed forces still in *service on a temporary basis or who may be called* to the services in the future on such basis have their dues remitted

B That the dues no longer be remitted to *members in the various services who have* accepted permanent commissions in the regular Army Navy or Air Force

C Authority is hereby given to the Council to use their discretionary power in any specific case not apparently covered by paragraphs A and B

I move the adoption of this report

DR. JAMES F ROONEY *Trustee* I second it

DR. HOMER J KNICKERBOCKER *Ontario* Would it not be best to place the term armed services' there instead of mentioning the regular Army Navy or Air Force ? I think it would

DR. ROONEY May I answer Dr Knickerbocker through you, Mr Speaker?

SPEAKER ANDRESEN You may

DR. ROONEY That matter was referred to the Reference Committee again for their consideration. As you may remember in the original resolution the language was armed services. That is ambiguous It is very ambiguous and it was suggested it be clarified. I think that the Committee afterward conferred with Dr Lull the secretary of the American Medical Association and this language was finally agreed upon as being the accurate method of making this exception

DR. KNICKERBOCKER In deference to my friend Rooney, I will withdraw and subside

DR FENWICK BEEKMAN *Assistant Treasurer* The Public Health is left out of there

SPEAKER ANDRESEN That is not an armed service

DR. ROONEY The point of fact is that the original resolution specified 'remission for those members of the armed forces of the United States That included the Public Health Service at that time and during the progress of active hostilities. Although the war is still on and it has never been declared over and in addition there is an emergency the Public Health Service reverted to the Department of the Treasury It is no longer even an affiliated service so there was no provision whereby that would come within the purview of the original resolution, Dr Beekman

DR BEEKMAN I stand corrected

There being no further discussion the motion was put to a vote and was unanimously carried

Section 156

Report of Reference Committee on Report of Council, Part V Public Health Activities C—Rehabilitation

DR PHILIP L FORSTER, *Section Delegate* The Subcommittee on Rehabilitation under the chairmanship of Dr O W H Mitchell reports continued satisfactory relationship between the Medical Society of the State of New York and the various government agencies concerned with rehabilitation No change in policy or procedure is reported

The Reference Committee is in receipt of a communication from G S Bohlin, Director of the New York State Education Department, Division of Vocational Rehabilitation Mr Bohlin specifically mentions the clarification and extension of fee schedule, specifying amounts which may be paid for certain authorized medical services He calls attention to the work being done by Dr Gordon D Hoople's Subcommittee on Hard of Hearing and the Deaf toward the establishment of centers where adequate diagnostic and technical help can be made available Mr Bohlin suggests that more physicians make a practice of referring to the Division at an early date those patients who are confronted with employment limitations because of any permanent disability arising from illness, injury, or deformity

Your Reference Committee recommends approval of this work, and I so move

DR MADGE C L MCGUINNESS, *New York* I second it

There being no further discussion, the motion was put to a vote and was unanimously carried

Section 157 (*See 12*)

Report of Reference Committee on Report of Council Part V Public Health Activities C—Geriatrics

DR PHILIP L FORSTER, *Section Delegate* The Subcommittee on Geriatrics, with Stephen R Monteith as chairman, has communicated with the deans of the medical schools in New York State, inquiring as to whether or not special courses were given or planned in geriatrics The responses at first indicated that the medical schools felt no definite need for such courses nor foresaw the likelihood of their establishment, but in a supplementary report of the Subcommittee on Geriatrics, which was just made available, it is learned that the deans of each of New York State's medical schools have assured the Study Committee of a keen desire to enhance their research programs in geriatrics problems and are only waiting for necessary monies to expand their activities

At a public hearing of the New York State Joint Legislative Committee on Problems of the Aging, the chairman of the Subcommittee on Geriatrics presented a report which was favorably received This report was approved by the Council Committee on Public Health and Education and the Council, and copies of the report are available at this time at the exhibit of the Medical Society of the State of New York. The Subcommittee is continuing its activities in close cooperation with medical schools and government and voluntary agencies The Committee notes increased interest in the subject of geriatrics and the paying of more attention to the care of adult chronically ill, including special clinics and home care services, provision for postgraduate and research studies in medical schools, as well as participation in government and voluntary agencies in the establishment of institutions

Your Reference Committee points to the need of publicity concerning the work of the State Society and its component counties Attention is called to the fact that the Montefiore Hospital in New York City has been caring for chronically ill persons at home at a very much reduced rate, and that Bellevue is considering the advisability of treating convalescents under similar circumstances This should help reduce the acute shortage of hospital beds in addition to saving considerable money for the family

It is recommended that the medical profession take a more active and aggressive role in promoting active interest of the profession in the care of the older age groups as well as the development of more adequate institutional facilities *in connection with existing hospitals* for such care Emphasis is placed on the responsibility of the profession itself to assume a more active leadership role

Your Reference Committee recommends approval of the work of this Subcommittee, and I so move

DR HOMER J KNICKERBOCKER, *Ontario* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 158

Report of Reference Committee on Report of Council, Part V Public Health Activities C—Nutrition

DR PHILIP L FORSTER, *Section Delegate* Following a suggestion by the New York State Commissioner of Health, Dr Herman E Hilleboe, a Subcommittee on Nutrition was appointed last October, with Dr Norman S Moore as chairman The Subcommittee made recommendations which were presented to the Council on December 11, 1947, and approved

1 Support the creation of a Nutrition Bureau in the State Department of Health

2 Support the plea to the curricula committees of the various medical schools of the State to introduce more subject matter concerning nutrition in medical education

3 Inform physicians of the State regarding recent advances concerning nutrition and stimulate their interest

(*a*) Educational articles in the NEW YORK STATE JOURNAL OF MEDICINE, using as a guide the *Handbook of the Food and Nutrition Board*

(*b*) At annual meetings of medical societies, work in special reports on the anthropologic aspects of nutrition in various cultures, and particularly our own culture, as a means of stimulating interest

(*c*) In the Council Committee on Public Health and Education include more programs on the subject

(*d*) Disseminate information regarding the importance of nutrition in all age groups, to the specialists in obstetrics, pediatrics, and geriatrics particularly, and stress the value of nutrition in all disease conditions

4 In cooperation with the State Health Department provide stipends for doctors who take advanced work in nutrition similar to the plans developed for special training in the cancer program

5 Support the State Health Department's request and the Food Commission's request for appropriations for research to be carried out at places where qualified nutrition clinics and educational facilities are available

The Subcommittee also approved, with minor revisions, the proposed program for the Bureau of Nutrition to be established in the State Department of Health

Your Reference Committee recommends approval of the work of this Subcommittee, and I so move.

DR. SAMUEL B BURK *New York* I second the motion.

There being no discussion, the motion was put to a vote and was unanimously carried

Section 159

Report of Reference Committee on Report of Council Part V Public Health Activities C—Physical Medicine

DR. PHILIP L. FORSTER, *Section Delegate* A Subcommittee on Physical Medicine under the chairmanship of Dr Charles M Allaben was appointed last June and held two meetings in September and October to consider the qualifications and licensing of physiotherapists in New York State A report with recommendations was prepared and submitted to the Council on December 11 the Council deciding that further study should be given this matter

Your Reference Committee recognising the many problems involved in trying to straighten out this perennial headache feels that more time and thought must be given this subject and that decisions must be arrived at only for the best interests of the ill patient.

Your Reference Committee recommends approval of the work of this subcommittee and urges the continuation of this committee. I so move

DR. MADGE C L. MCGUINNESS *New York* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. FORSTER Your Reference Committee desires at this time to commend Dr Mitchell and his committees for the excellent work they have done. They have made an invaluable contribution to the medical profession as well as to the general public of this State.

Mr Speaker I move the adoption of the report of your Reference Committee as a whole

DR. STEPHEN R. MONTEITH *Rockland* I second it.

There being no discussion the motion was put to a vote and was unanimously carried

Section 160 (*See 46*)

Report of Reference Committee on Report of Council, Part V Creation by Medical Society of the State of New York of a Special Committee on the Problems of Alcoholism

DR. PHILIP L FORSTER *Section Delegate* We have several resolutions on alcoholism, all from Erie County The first requests the creation by the Medical Society of the State of New York of a Special Committee on the Problems of Alcoholism

'WHEREAS, individuals manifesting the complex symptoms of alcoholism and compulsive drinking are sick persons in need of enlightened, sympathetic, and effective medical care, alcoholism being a disease to be dealt with as such and

"WHEREAS, the broad question of the prevention and treatment of chronic alcoholism is a matter of immediate and deep concern to the medical profession of every community of the State of New York, the medical profession being conscious of its obligation to assist in reducing the incidence of chronic alcoholism, in providing adequate facilities for medical and institutional care and rehabilitation of these sufferers and in re-establishing the chronic alcoholic, both socially and economically, and

'WHEREAS there exists widespread demand among members of the medical profession of New York State that the Medical Society of the State of New York assume the leadership in developing within medicine's ranks a well-balanced program—preventive therapeutic and rehabilitative—and furthermore in stimulating increased interest in this vital problem by all component county societies now, therefore be it

'*Resolved* that the Medical Society of the State of New York represented in this duly convened Annual Meeting of its House of Delegates, hereby places itself on record as strongly favoring, approving and requesting that there be established at the earliest possible date through appointive action by the President of such State Society a *Special Committee on the Problems of Alcoholism* such Special Committee to be representative geographically of all populous sections of the State and be it further

Resolved, that the Medical Society of the State of New York through the agency of the proposed *Special Committee on the Problems of Alcoholism* or the Council of the State Society urgently request each component county medical society in the State to appoint a local Special Committee on the Problems of Alcohol to function actively in association with its work in the field of public health.

Your Reference Committee recommends adoption of this resolution I so move

DR. WILLIAM KLEIN *Bronx* I second the motion

DR. HARRY ARANOW, *Councilor* This is really not a discussion, but it is to let you know that the legal profession in New York and several organizations including the Academy of Medicine are already making a study of the subject, and I know that the Medical Society of the State of New York is going to be invited to join

SPEAKER ANDRESEN This will fit right into that then?

DR. ARANOW Yes

SECRETARY ANDERTON This subject would have been I am sure, discussed by Dr Mitchell chairman of the Public Health and Education Committee, except that he is in conference now with the State Commissioner of Health

This subject of alcoholism has been referred previously to the Public Health and Education Committee and through them to the Committee on Psychiatry I am quite sure I am quoting Dr Mitchell's feeling that this subject heartily deserves our support but it should be referred to the Public Health and Education Committee through the Council rather than to establish a whole new committee for it. We have a lot of committees already I don't know how many there are

DR. JAMES F ROONEY *Trustee* I move to amend the recommendation of the Reference Committee that the reference be to the Council and the subsequent assignment to the already existing committees of the Council for continuation of this work.

DR. HARRY C GUESS *Erie* In February of this past year we sent a recommendation to the State Society That recommendation went to the Council They in turn collaborated with the Academy of Medicine of New York City This problem now is so large and so timely that the men in Erie County who have given a lot of time to this particular subject feel that if they had a special committee of men, representatives from the various parts of our State and not placed under the Mental Hygiene Subcommittee where it is now that they would be able to do

a much better job in eliciting help from civic organizations and thereby do it quicker This committee can work right with the subcommittee under Dr Mitchell, we have no objections to that at all, but we do believe that we can get better public relations if we have five or six men appointed by the President who may sit in on their meetings and thereby accomplish this thing a little bit faster than the way we have been doing We do not wish to take any work away from any subcommittee, but we do feel that the time is ripe to do something with the general committee I am sure if you are thinking about the expense, that there will be no expense with this type of committee that is formed because these men are all sincere in their efforts toward the treatment of alcoholism, not as a mental condition, but as either a physical or a psychologic condition in our State or in our general hospitals throughout the country

With that in mind, we feel sincerely that this committee will not interfere with the work of other committees of the State Society and it will not cost the Society anything, but that eventually we will gain by it in that the treatment of alcoholism will fall under the general doctors in each county rather than staying in mental hygiene or in the State institutions We in Erie County are very sincere when we ask that this committee be formed

SPEAKER ANDRESEN The discussion is on the amendment to refer to the Council

DR ROONEY I would like to ask the unanimous consent of the House to withdraw my proposed amendment

SPEAKER ANDRESEN Is there any objection?

There was no reply

SPEAKER ANDRESEN The motion to refer is withdrawn

DR. ROONEY Now I would like to propose, in view of what has just been stated by the preceding speaker, that the President be requested to appoint a special committee of six from the members of the House to carry on the work recommended in the original resolution

DR THOMAS MCGAVACK, *Section Delegate* In conjunction with the Council

DR ROONEY In conjunction with the Council

DR STEPHEN R MONTEITH, *Rockland* I will second that

DR. HARRY ARANOW, *Councilor* What is the original motion?

DR FORSTER They would like to have a committee appointed

DR ARANOW It does not give the number?

DR FORSTER No

SPEAKER ANDRESEN It does not give the number It only recommends the appointment of a committee and does not give the number Dr Rooney's motion specifies a committee of six

DR ROONEY Which is the number suggested by the preceding speaker, Dr Guess

DR BENJAMIN F GLASSER, *Queens* I would like to know what Dr Rooney really means when he specifies the appointment of a committee from members present in this House Why does he want to limit it to members of this house?

DR. ROONEY Ordinarily when the House of Delegates wants a special committee appointed—and we carried on in the same manner on the question of the basic science law study—it is requested that that committee be appointed from the members of the House by the President It is immaterial to me but, gentlemen, it has been my experience that if you have a special committee of this sort from the House to operate in conjunction with the Council the judgment of those representatives of the various districts of the State who have already sat in at the House discussion is likely to be much more productive of worthwhile material than this question of choosing it from the membership at large That is the reason

DR GLASSER Agreed

The question being called, the amendment was put to a vote and was unanimously carried

SPEAKER ANDRESEN Now we are on the recommendation of the Committee as amended Is there any discussion?

The question was called, and the motion was put to a vote and was unanimously carried

Section 161 (*See 51*)

Report of Reference Committee on Report of Council, Part V Study of Alcoholism Problem by State Department of Health

DR PHILIP L FORSTER, *Section Delegate* The next resolution is on the Study of Alcoholism Problem by the State Department of Health

"WHEREAS, alcoholism is an illness of individual and public concern, and

"WHEREAS, the estimated number of excessive drinkers in New York State is about 283,000, of whom 70,000 are chronic alcoholics, and the amount of suffering on the part of the patients and their dependents as a result of alcoholism is tremendous, and

"WHEREAS, the alcoholic is a sick person who often wants to be helped, but all of the causes of this illness are not known, and

"WHEREAS, medical facilities for the care and treatment of the alcoholic patient are woefully inadequate, and

"WHEREAS, the amount of money spent by government agencies in the ineffectual method of handling the alcoholic through prisons and penitentiaries, plus the amount spent for taking care of the dependents of these individuals, is considerable, now therefore be it

"*Resolved*, that the Governor and the Legislature of New York State be petitioned and urged to direct and authorize the State Department of Health, which is charged by the Public Health Law with safeguarding the health and life of the people of the State, to study the problem of the prevention and alleviation of alcoholism, and to devise methods and programs for the treatment and rehabilitation of chronic alcoholics, the Department to be provided with an adequate appropriation for this project, and, furthermore, that copies of this resolution be transmitted to the officials concerned for their favorable action"

Your Reference Committee recommends adoption of this resolution, and I so move

DR STEPHEN R MONTEITH, *Rockland* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 162 (*See 67*)

Report of Reference Committee on Report of Council, Part V Isotope Committee

DR PHILIP L FORSTER, *Section Delegate* The last resolution was introduced by Dr Laurance D Redway and Dr Norman S Moore

"WHEREAS, the policy of the United States Atomic Energy Commission is liberal with respect to the release of radioactive isotopes for research in general, and

"WHEREAS consequent upon this farsighted policy of the Commission many more radioactive materials will be handled by an increasing number of people and

WHEREAS the danger to technical personnel and the public through carelessness or lack of uniform protective measures in dealing with these materials will increase and

'WHEREAS, in the event of the emergency of mass radiation, immediate protective measures would be imperative now be it

'Resolved that the Medical Society of the State of New York, acting in the public interest instruct its Council to create an isotope committee for the purpose of coordinating the protective measures now being formulated by various scientific medical public health and industrial groups and through the educational channels of the Society familiarize the physicians of the State with all known protective measures applicable to peacetime uses of radioactive materials

Your Reference Committee recommends approval of this resolution, and I so move

DR. WILLIAM KLEIN *Bronx.* I second the motion

DR. JAMES F ROONEY, *Trustee* I think this should be referred to one of the quasi-standing committees of the Council or rather to the Council for reference to such committee Do you have any idea how many committees and subcommittees of the Council you already have, and remember a member of the Council must be the chairman of each of these committees? You have over 48 and I think you have provided for the assignment or creation of two or three more during the period of this session It seems to me that the wise thing to do is to refer *this to the Council. We are going to have* committees on the extension of the little toenail of the right foot pretty soon While this is a valuable thing and an important one—not that I am so seriously afraid we are going to have any particular atomic warfare in the very immediate or reasonably distant period—I think we ought to refer this to the Council, and I so move

SPEAKER ANDRESEN Will you accept that?

DR. FORSTER Yes

DR. STEPHEN R. MONTEITH, *Rockland* I will second it.

There being no discussion the motion as amended was put to a vote and was unanimously carried

SPEAKER ANDRESEN We thank you Dr Forstor

Section 163 (See 63)

Report of Reference Committee on Report of Council Part VI Economics

DR. EDWARD P FLOOD, *Bronx* Your Reference Committee has studied the report of the Council Committee on Economics and subscribes to its contention that many new factors are making their impression on the practice of medicine as we have known it and calls our attention to several of these

First, the continued controversy of the specialties of pathology anesthesia, physiotherapy and roentgenology with hospital administrators relative to their reimbursement of services rendered to holders of hospitalization insurance and beneficiaries of voluntary medical service plans. Your Reference Committee is in sympathy with the efforts of members of these specialties to remedy this inequity and calls to their support every member of organized medicine who is on a hospital staff

Unfortunately the members of these specialties are in a special category because they are on a salary basis without security of tenure and are faced with the realization that their positions can be readily filled by an ever increasing number of younger specialists eager for the salary and the professional prestige associated with or conferred by a title

Until the profession at large makes the members of these specialties independent by referring their private work to their individual offices rather than to the hospital laboratories they will not be able to compel hospital administrators to recognize the justice of their complaints.

The evils inherent in the employment of specialists by hospitals are obvious and should warn us against the extension of this practice to the major specialties such as surgery medicine, and obstetrics This is already accepted practice in the large teaching centers but recently has invaded the precincts of many so-called voluntary hospitals. While these directors are not, ostensibly in the practice of medicine, the hospital administration charges those who seek their care substantial fees which do not revert to these men Your Reference Committee condemns their attendance in any but service cases

The Council Committee notes the continued formation of lay organizations interested in many branches of medicine and, while it recognizes their advantages and the present limitation of their activities to case finding it is concerned with the possible further extension of their facilities into the realm of treatment

The Council Committee also takes note of the increased cost of illness but we must insist that medical care as such has not substantially contributed to the increase

The cost of hospitalization and the cost of nursing care has more than doubled in the past few years We should realize that private duty nursing can only be secured at the cost of $1 000 a month and insist upon group nursing to better distribute a necessity which has now become a very expensive luxury

We should encourage the movements such as those instituted by the Montefiore Hospital for Chronic Diseases for the extension of medical care to the home The average cost per patient day in most hospitals now approaches $16 If many hidden costs such as tax exemption, capital underwritings obsolescence and depreciation were recognized by hospital accountants as actual, the cost per patient per day would be nearer $20 The services of a physician a housekeeper and a visiting nurse may be secured for less than this if the patient were invalided at home as soon as the necessity for urgent hospital care is ended.

The Council Committee calls our attention to certain powerful minority groups in our profession who seek some form of federalized medicine. While many of these physicians may be idealists or ideologists, numbers of them are motivated by a desire for security I refer particularly to physicians who are on salary whose pension rights may be jeopardized by inflation or a drying of the wells of philanthropy These men are in a position to indoctrinate the future doctor from the earliest days of his student career and in many institutions do not hesitate to do so

The Council Committee asks for the continued support of the voluntary nonprofit insurance plans sponsored by the Society The individual physician should encourage his patients to make use of these plans and further we urge willingly make the sacrifice in time and patience necessary to the completion of essential reports

I move the adoption of this portion of the report

SECRETARY ANDERTON I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 164

Report of Reference Committee on Report of Council, Part VI Public Medical Care

DR EDWARD P FLOOD, *Bronx* Your Reference Committee carefully considered the report of the Subcommittee on Public Medical Care as published in the annual report We note with approbation the continued cooperation of the Subcommittee on Public Medical Care with the representatives of the State Department of Social Welfare and those of the New York State Association of Public Welfare Officials, as well as the representatives of the medical consultants of the various local medical plans known as the Joint Committee

The Subcommittee wishes to emphasize again that its function is at a State level and that they cannot solve the problems, policies, and procedures of local welfare agencies The solution of such problems should be made at the level of the local welfare commission and county medical society The subcommittee notes that there are now 44 local medical consultants from the various counties who may act as a liaison between the local physicians and the local welfare administrations

Again the subcommittee notes that the majority of complaints received by them has been relative to the procedure of payment to patients for medical services There is an increasing tendency in the large communities for the patients to withhold what is paid them by the welfare agency for medical services and appropriate it to other uses The State Department of Public Welfare would have no objection to paying the physician directly, but the regulation of the Federal Security Board requires that such payments be made to the patients and not directly to the physician

While the Joint Committee is not unfavorable to a recommendation that the Federal Social Security Board be petitioned to change this regulation, it was brought to our attention by the chairman of the subcommittee that such a change would place the medical profession in an inconsistent position It was at the urging of organized medicine that, in order to maintain the traditional patient-physician relationship and to relieve the patient of the possible opprobrium inferred in not trusting him to reimburse the physician for professional services rendered that this regulation was originally adopted Your Reference Committee still holds this conception valid and recommends that the method of reimbursement be not changed by a petitioning of the Federal Social Security Board

The Reference Committee notes with satisfaction that the fee schedule for welfare patients has been substantially increased, but we hope that the citizenry will realize that these fees are nominal and represent a contribution of the medical profession to the general welfare

I move the adoption of this portion of the report

SECRETARY ANDERTON I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 165 *(See 92)*

Report of Reference Committee on Report of Council, Part VI Practice of Medicine by Hospitals

DR. EDWARD P FLOOD, *Bronx* The Reference Committee had before it the resolution introduced by Dr B M Bernstein, of Kings, relative to the practice of medicine by hospitals

"WHEREAS, there is an increasing tendency on the part of hospitals to employ full-time directors of service in other fields of medicine in addition to those already in operation in radiology, pathology, and anesthesiology, and

"WHEREAS, such a program is a definite threat to the individual and private practice of medicine, and

"WHEREAS, such a plan would appear to place hospitals in the business of practicing medicine, and

"WHEREAS, such a procedure, if left uncontrolled and uncurbed, except in the matter of undergraduate teaching of medical students, might lead to unforeseen difficulties for the practice of medicine, therefore be it

"*Resolved*, that the Council be instructed to set up a special Hospital Relations Committee to study this problem and to use its efforts to prevent hospitals from practicing medicine and interfering with the private practice of medicine, and to use all moral and, if necessary, legal methods for this purpose"

The Reference Committee approves the intent of this resolution, but substitutes the following resolution

"*Be it resolved*, that the Council be instructed to refer this matter to an appropriate, existent committee of the Council to study this problem and to use its efforts to prevent hospitals from practicing medicine and interfering with the private practice of medicine and to use all moral and, if necessary, legal methods for this purpose"

I move the adoption of the report of the Reference Committee

DR STEPHEN R MONTEITH, *Rockland* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 166 *(See 68)*

Report of Reference Committee on Report of Council, Part VI Insurance Forms

DR EDWARD P FLOOD, *Bronx* We also had the resolution introduced by Dr Charles Gullo, of Livingston County, on Insurance Forms

"WHEREAS, physicians are asked to make out many illness and mortality forms of insurance companies, and

"WHEREAS, the filling of such forms often requires considerable time, and

"WHEREAS, these forms are generally never alike, be it

"*Resolved*, that the Council appoint a committee to meet with a committee of the Association of Life Insurance Companies for the purpose of standardizing the illness and mortality forms and thereby make them more brief"

The Reference Committee approves of this resolution, and moves its adoption I so move

DR. MOSES H KRAKOW, *Bronx* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 167 *(See 29)*

Report of Reference Committee on Report of Council, Part VI Voluntary Health Insurance Plan

DR. EDWARD P FLOOD *Bronx* Your Reference Committee has the resolution introduced by Dr Thomas M D Angelo of Queens County concerning voluntary health insurance plans recommending that the Medical Society of the State of New York advise its members not to become participating physicians in any voluntary health insurance plan unless it has been approved by the Medical Society of the State of New York

The Reference Committee is in complete accord with the purpose of this resolution and recommends its adoption. I so move.

DR. FRANK CERNIGLIA, *Queens* I second the motion.

SPEAKER ANDRESEN *The recommendation of the* Reference Committee, carrying with it the approval of the resolution, is before you for discussion

DR. ARTHUR A. FISCHL, *Queens* I am very much in accord with this resolution I might say that this resolution was not brought up before the Queens County Medical Society It is a resolution offered by Dr D Angelo himself

I might also say that there are so many ramifications of this particular problem. There is no punitive effort involved We in the metropolitan area, are confronted with this problem very seriously at present. There are approximately 3 000 participating physicians in two existing plans one of which has been approved by one or two county societies and the other had not asked for approval and has been disapproved I would suggest that the metropolitan area, inasmuch as it is the one that is so involved, discuss this en masse first and present it at some future time.

SPEAKER ANDRESEN Do you wish to make an amendment?

DR. FISCHL Yes I so amend.

SPEAKER ANDRESEN You amend what?

DR. FISCHL I would like to amend this resolution that the metropolitan area, inasmuch as it is the area involved in this particular resolution, study this, and that it be referred to the Coordinating Council of the metropolitan area first for study

SPEAKER ANDRESEN We cannot refer it to the Coordinating Council That is not an official body

DR. FISCHL I would suggest this—I don t know whom to refer it to—that we defeat the resolution, but inasmuch as the metropolitan area is the one involved, and we are going to have 3 000 physicians who may or may not adhere to this resolution I think it is inadvisable for us to pass this resolution and then decide whether or not we are going to issue punitive efforts on those men in the metropolitan area who will not abide by our resolution

SPEAKER ANDRESEN Then you oppose the motion, or are you making an amendment?

DR. FISCHL I oppose the motion

DR. HAROLD B DAVIDSON *New York* There is nobody more than I, nor any county more than New York, which would have enjoyed the backing of the State Society in handling this problem. However, for the same reasons that the previous speaker just mentioned, I believe that this is one of those purely local situations that should be solved at the county level. I therefore, object to the passage of this resolution.

DR. THOMAS M D ANGELO *Queens* First let me say that I did bring in this resolution as an individual. However in so doing I just brought in a resolution that had been passed by the Queens County Medical Society and it stands on its books since 1945

The reason really why I bring this resolution in is so that the matter cannot be solved on a county level. At the present time it may be the problem of the metropolitan area, but within a year or two it is going to be the problem of the upstate area.

We are confronted with a very very peculiar situation Take the New York City area. Here are five counties in the City of New York two counties have specifically disapproved a certain voluntary insurance plan, and two or three counties have taken no action on it The result is that the doctors in the metropolitan area don t know what to do In two counties they have been asked not to join in three counties no action has been taken It is really an anomalous situation. Here we are one city with *different actions being taken in different portions of the city*

Upstate you are going to have that problem pretty soon You are going to have an insurance company start business and the insurance company does not confine itself to one county but spreads over several

We would like the Medical Society of the State of New York just to go on record advising that its members do not become participating physicians in any plan that has not been approved by the Medical Society of the State of New York There is no punitive action involved You cannot have any punitive action here unless the plan is acting unethically Only then can you have a punitive action This is so that all of the doctors are advised not to become physicians in plans that have not our approval It becomes state-wide so that when any physician wants to join a plan all he has to determine is whether it has the approval of the Medical Society of the State of New York yes or no and he can guide himself accordingly This is a very necessary thing

DR. LEO F SCHIFF, *Clinton.* I wish to second what Dr D Angelo has said, and in order to make the motion more effective if passed, I wish to add an amendment which I hope Dr D'Angelo will accept, that the board, or committee or whatever it is that has charge of the prepayment plans—we have such a committee and I cannot think of its name—shall be directed to notify all component medical societies of the action taken. That is simply so we won t wait for the members to read of it in the JOURNAL.

DR. D ANGELO I will second that.

DR. ROONEY Why not have the Secretary of the Society do it?

DR. SCHIFF All right, change it to the Secretary

DR. D ANGELO Right.

DR. ROONEY Not the committee.

DR. SCHIFF Right.

SPEAKER ANDRESEN Will you accept that as an amendment?

DR. FLOOD Yes I will accept that as an amendment.

SPEAKER ANDRESEN That will save us some time

DR. BENJAMIN F GLASSER, *Queens* I think Dr D'Angelo has pointed out very nicely and briefly how this question cannot be settled on a State-wide basis As a matter of fact, the field is new and the whole situation is in such flux, that even in the City of New York, as he has pointed out two counties have acted one way and three counties have taken no action They don t agree Now place yourself in the position of putting the whole thing before the State You will never come to any conclusion if you adopt that principle and any plan that is proposed will of necessity be outside of the practice of organized medicine, and before we know it the members will be in the plan outside of organized medicine I am against the resolution.

SPEAKER ANDRESEN Is there any other discussion?

DR HARRY ARANOW, *Councilor* It still has to be a local thing because, after all, it will have to be decided by the organization in its own district The State Society cannot tell whether or not an organization is fit for the district There are some of these insurance companies who are not approved who may be doing the same thing we are doing, trying to prevent socialized medicine, and I don't think we ought to come to any conclusion and force it down the throat of the individual county I would refer it back to the county

SPEAKER ANDRESEN As I understand it, there is no forcing of anything down anybody's throat It is merely a recommendation to the members

DR D'ANGELO May I have the privilege of speaking once more? This is a very important problem No one is forcing a plan down anyone's throat If a plan can meet the principles laid down by the Medical Society of the State of New York, it can be approved by the Medical Society of the State of New York That is all we ask There are certain principles that have been adopted, and it just so happens a number of plans have not met those principles, yet different portions of the city or even different portions of the State may take different actions on a local level, but these plans transcend being on a local level, they go across counties, and it is not fair for one county to take no action while another county disapproves If a plan is worthy, and meets the requirements of the State of New York, it should come to the State Society and say, "Here is my plan I meet your requirements Am I approved?"

There were calls for the question

The motion was put whether to call the question, and it was carried, thereupon the amendment was put to a vote and was carried, after which the motion as amended was put to a vote, and was carried

DR FLOOD Now I move to adopt the report of the Reference Committee, which was concurred in by all the members, as a whole, as amended

DR THOMAS M D ANGELO *Queens* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 168 (*See 32, 33*)

Report of Reference Committee on Miscellaneous Business A Blood Banks

DR FREDERICK W WILLIAMS, *Bronx* Your Reference Committee had before it for consideration two resolutions, one concerning blood donor service and one concerning blood banks The first resolution introduced by Westchester County

"WHEREAS, the National Red Cross has undertaken the establishment of a nation-wide Blood Donor Service program, the basic philosophy of which is to provide free blood for all, and which provides in some areas not only for donor service but also for collecting, processing, and distributing blood from a centralized bank, and

"WHEREAS, free service for all economic levels of the population is not compatible with established patterns of American life, and

"WHEREAS, a centralized blood bank service under the Red Cross may tend to destroy existing blood banks in the hospitals, and

"WHEREAS, all professional and technical phases of a blood bank program should be under the control and supervision of the physicians of the community, and

"WHEREAS, a permissive program adapted to meet local needs has been approved in Westchester County in full cooperation with the Westchester Chapter of the American Red Cross, now therefore be it

"*Resolved*, that the New York State Medical Society urge county societies to consider the establishment of a Red Cross Blood Donor Service Program similar to that proposed for Westchester which provides

"1 Red Cross Blood Donor Service,

"2 Free Red Cross blood for the medically indigent who are unable to provide replacement,

"3 The continuation of existing hospital blood banks and encouraging the establishment of banks in other hospitals,

"4 Implementation and supplementation of the existing blood bank services,

"5 All professional and technical control and supervision of the donor service program vested in a committee of physicians appointed by the county medical society,

"6 *And general coordination of the program* through a committee representing the Red Cross, the County Hospital Association and the county medical society"

The second resolution introduced by Dr Harry Aranow in behalf of the Council

"WHEREAS, transfusion has become a very important, essential, and life-saving measure in the practice of medicine, and

"WHEREAS, there has been a feeling in the medical profession that the control and collection of blood and blood elements is gradually being taken out of the hands of the medical profession, and

"WHEREAS, there has been an organization formed in the state of Texas called the American Association of Blood Banks, and the purposes of of this organization being

1 To promote and foster the exchange of ideas and materials and the dissemination of information to blood banking and its technical methodology of education, publicity, and research,

2 To foster and plan for cooperation in times of disaster,

3 To function as a clearing house on questions relating to the training of personnel common to such institutions,

4 To keep currently aware of and encourage high standards of service,

5 And to promote and foster and aid and encourage the extension of similar services throughout the United States and its territories, therefore be it

"*Resolved*, that the House of Delegates of the Medical Society of the State of New York are in favor of the purposes of this organization"

Your Reference Committee report in regard to these two resolutions considered together as follows

Your Reference Committee, after deliberation and conference, in due consideration of the importance of the establishment of blood banks and provision for blood donor service both in relation to private practice and civilian medicine, and also in the light of a possibility of a sudden widespread emergency, feels that these are of utmost importance to the profession in this State and the country

Therefore, your Reference Committee recom-

mends that the Medical Society of the State of New York establish a special Committee on Blood Banks of the Council Committee on Public Health to supervise and coordinate the nonprofit blood banks throughout the State This Committee should encourage advise, and assist in the establishment of blood banks on a local county or similar decentralized subdivision basis This Committee should see that these blood banks are so constituted and organized that cooperative effort could immediately be carried out in case of emergency The Reference Committee suggests that the Society approve the principles of the American Association of Blood Banks to have ultimately blood banks of the State possibly become associated in this group

Furthermore the Reference Committee recommends that this special committee use as an example the good cooperative plan proposed and agreed upon by both the Red Cross and Westchester County Society and in the process of being established in Westchester County In this plan prominent features are that the medical profession operates the blood banks and supervises them Under this plan the Red Cross cooperates in the obtaining of blood donors and transportation of donors and blood The Red Cross also may be permitted to support the service with financial aid for equipment and nontechnical assistance

Your Reference Committee feels that this problem is of such importance that this should be a special committee to the Society not necessarily just of the Council

DR. JAMES F ROONEY, *Trustee* I second it.

SPEAKER ANDRESEN The recommendation of the Reference Committee which has been moved and seconded is up for discussion Is there any discussion?

DR. SCOTT LORD SMITH *Dutchess* I thoroughly approve of this whole report of the Committee, but I want to call to your attention—and I think we ought to consider it—that back of this whole matter is a certain tendency of the Red Cross to make of itself a national public uplift organization and that in smaller communities, like mine up in Dutchess County there is going to be very strong pressure from the Red Cross to get themselves in control of the situation because of the relative facility with which they can obtain donors

Then the other side we should consider is the emergency for which we must be prepared I do think that we have got to be very careful in our control of the activities into which the Red Cross enters. However there is another side to it which is we have got to have all of the aid we can possibly get from the Red Cross in carrying out this program. It is a very delicate, diplomatic situation to make the adjustment

SPEAKER ANDRESEN Is there any further discussion?

DR. WILLIAMS Your Reference Committee was fully aware of these conditions that Dr Scott Lord Smith has called to the attention of the House We felt that the re-establishment really of this Blood Bank Committee as a subcommittee of Dr Mitchell s Public Health Committee could take care of the details with the suggestions that we recommended

We are all well aware especially in New York, that the Red Cross would like to take over the blood banks every blood bank in America. We are all aware that the doctors should operate the blood banks and the Reference Committee feels its report has covered this quite thoroughly

I once again recommend the adoption of the Reference Committee s report

DR THOMAS F MCCARTHY *Bronx.* May I offer an amendment, if the Chair will accept it that this Committee negotiate with the Red Cross so as to revise any previous agreements which do not conform with this recommendation?

SPEAKER ANDRESEN Isn t that covered by the report?

DR. MCCARTHY But there are previous agreements made with the Red Cross before this was brought up which do not conform.

DR. WILLIAMS Dr McCarthy is quite right In the City of New York there have been some sort of agreements by which the Red Cross proceeded to jump right in and set up the blood banks regardless of whether the doctors are running them or not We feel that this Committee would undoubtedly include the revision of any already established blood collection services set up by the Red Cross We have set these criteria down for the Committee and I am sure every member of the Reference Committee would be glad to accept that amendment You don t need to vote on it

DR. THOMAS M. D ANGELO *Queens* As a matter of fact, the Red Cross program in New York City is only going on for one year and at the end of the year will be completely evaluated so that our criteria at that time can be brought to their attention very well then

DR. HAROLD B DAVIDSON *New York* I thoroughly approve of the Committee s report, and have only one comment It speaks of free blood With the Red Cross there is no such thing as free blood

DR. WILLIAMS That word free' will be deleted

The question was called and the motion was put to a vote and was unanimously carried

Section 169 (*See 93*)

Report of Reference Committee on Miscellaneous Business A Automobile Agency

DR. FREDERICK W WILLIAMS, *Bronx* Your Reference Committee also received a resolution

WHEREAS It is becoming increasingly difficult for physicians to purchase automobiles and

WHEREAS the automobile is a part of the doctor s equipment in his practice of medicine therefore be it

Resolved that the Council of the Medical Society of the State of New York be instructed to explore the possibilities of establishing an agency for the purchase of automobiles by doctors.

Your Reference Committee recommends the disapproval of this resolution and I so move

DR STEPHEN R. MONTEITH *Rockland* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. WILLIAMS Now I move the approval of the report as a whole as amended

DR THOMAS F MCCARTHY *Bronx* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN Thank you Dr Williams!

Section 170 (*See 69*)

Report of Reference Committee on Miscellaneous Business B Draft of Physicians

DR. WILLIAM B RAWLS, *New York* I have only one more resolution here, introduced by Dr B M Bernstein of Kings

WHEREAS, the medical profession always has taken and always will unselfishly take its part in any national emergency and

"WHEREAS, it would appear that the passage of draft legislation by the Congress is imminent, and

"WHEREAS, indications are that an attempt will be made to adopt a different age differential for physicians from that to be advised for the rest of the available population, and

"WHEREAS, it would appear that an adequate pool of physicians already exists from amongst those educated under government student programs during the last war and as yet not called for duty, and from those deferred during the last war for a variety of reasons, and from amongst those now completing or who will complete internships during the next two years, and from those who will volunteer their services, even though not of draft age, therefore be it

"Resolved, that such a differential in age of those eligible for draft would be discriminatory, unnecessary, undemocratic, and contrary to the principles of our constitution, and be it further

"Resolved, that the proper committees of the House, Senate, and the presiding officers of those bodies and the Secretary of National Defense and the Secretaries of the Army, Navy and Public Health Service, and the President of the United States be so advised by the endorsement of this resolution at this session of the House of Delegates, and be it further

"Resolved, that the chairman of the National Security Resources Board and the Secretary of National Defense be urged to sanction the creation of a Civilian Medical Board to aid in obtaining the necessary medical personnel which would be required under a selective service draft act, and be it further

"Resolved, that the secretary be instructed to transmit these resolutions to the above-named authorities without delay"

Your Reference Committee considered this, and we felt that the wording should be changed We added one "whereas" to bring out some of the resolved that we felt was necessary

"WHEREAS, in World War II procurement and assignment for physicians, dentists, and veterinarians did an excellent job, and it was not necessary to draft any of these groups, much to the credit of these groups, although the proportion entering service was greater than any other group, therefore, be it

"Resolved, that the Secretary for the national defense be urged to set up a board similar to the procurement and assignment board of World War II to aid in obtaining the necessary medical personnel, and be it further

"Resolved, that this House of Delegates express its request that whatever boards are formed to secure medical personnel for the armed services exhaust all possibilities of obtaining them from the groups above named and from those of draft age and from volunteers, before any outside these groups are asked to serve, and be it further

"Resolved, that a copy of this resolution be sent to whatever boards are set up to obtain medical personnel for the armed services, and be it further

"Resolved, that the delegates to the American Medical Association from the Medical Society of the State of New York be instructed to introduce this resolution at the annual meeting of the American Medical Association in 1948"

I move its adoption as thus reworded

"WHEREAS, the medical profession always has been, and always will, unselfishly, take its part in any national emergency, and

"WHEREAS, it would appear that the passage of draft legislation by the Congress is imminent, and

"WHEREAS, indications are that an attempt will be made to adopt a different age differential for physicians from that to be advised for the rest of the available population, and

"WHEREAS, it would appear that an adequate pool of physicians already exists from amongst those educated under government student programs during the last war and as yet not called for duty, and from amongst those now completing or who will complete internships during the next two years, and from those who will volunteer their services, even though not of draft age, and

"WHEREAS, in World War II procurement and assignment for physicians, dentists, and veterinarians did an excellent job, and it was not necessary to draft any of these groups, much to the credit of these groups, although the proportion entering service was greater than any other groups, therefore be it

"Resolved, that the Secretary for National Defense be urged to set up a board similar to the procurement and assignment board of World War II to aid in obtaining the necessary medical personnel, and be it further

"Resolved, that this House of Delegates express its request that whatever boards are formed to secure medical personnel for the armed services exhaust all possibilities of obtaining them from the groups name above and from those of draft age and from volunteers before any outside these groups are asked to serve, and be it further

"Resolved, that a copy of this resolution be sent to whatever boards are set up to obtain medical personnel for the armed services, and be it further

"Resolved, that the delegates to the American Medical Association from the Medical Society of the State of New York be instructed to introduce this resolution at the annual meeting of the American Medical Association in 1948"

DR FREDERICK W WILLIAMS, *Bronx* I second the motion

SPEAKER ANDRESEN Any discussion?

DR BENJAMIN M BERNSTEIN The *Journal of the American Medical Association*, Volume 137, No 2, May 8, 1948 issue, pages 162 and 163, referring to the action of the Council on National Emergency Medical Service says

> In making special provision for the drafting of physicians up to the age of 45 years this bill in the opinion of the Council proposes a type of legislation that is on its face highly discriminatory and coercive if not actually unconstitutional

And then it goes on further to say

> 'It is therefore the considered opinion of the Council on National Emergency Medical Service that immediate action should be taken committing the American Medical Association in opposition

(etc)

There is also an editorial in the very same issue where the Council urges each State and local medical association to exert every effort and influence at its command within the next several days to assure the establishment of a civilian medical board at the highest level of government, such as a functioning agency of the National Security Resources Board, to be responsible for the policies and programs re-

quired for the medical health and sanitary services of the civilian population, of industry, of agriculture, and of the armed forces in time of emergency of national mobilization

We might duck the idea of the draft act being discriminatory, but discriminatory it would be if passed in the form as proposed by the Congress at the present time We might duck it by saying we will be nice boys and do what we did before, but apparently the Council wishes the possible discriminatory action to be avoided by such action of ours.

Secondly to ask the delegates to the American Medical Association to present similar resolutions before that body will not accomplish very much because Congress will be out of Washington long before that action can occur

I believe the discriminatory paragraph might well be permitted to remain

DR. RAWLS It says that these boards be so informed We can change that to whatever authorities are deemed necessary

DR. HARRY ARANOW, *Councilor* Our Senators and Representatives could be informed.

DR RAWLS I accept that

DR ROONEY I think it should be definitely provided that the Secretary be directed to send the information of the passage of these resolutions, quoting the essential parts thereof to all persons concerned in the enactment of this legislation as the official action of the Medical Society of the State of New York and not merely the Council

DR. J STANLEY KENNEY *Councilor* I second that amendment

SPEAKER ANDRESEN Will you accept that?

DR. RAWLS Yes. It is practically in here except it does not say all authorities.

The question was called, and the motion as amended was put to a vote and was unanimously carried

SPEAKER ANDRESEN I don t believe there are any more reference committees to report Are there any?

There was no response

Section 171

Notice to Amend Article XI of the Constitution and Bylaws of the Medical Society of the State of New York

SPEAKER ANDRESEN Dr Monteith would like permission to introduce a constitutional amendment. He requires a two-thirds vote for permission to introduce this

The request was put to a hand vote and there was no negative vote cast.

DR. STEPHEN R. MONTEITH, *Rockland* Notice to amend Article XI of the Constitution and Bylaws of the Medical Society of the State of New York covering the setup of the district branches

WHEREAS, it appears that geographical redistribution of the District Branches would be advantageous with the possible creation of a Ninth District Branch therefore be it

'Resolved that Article XI of the Constitution and Bylaws of the Medical Society of the State of New York be hereby amended to create a Ninth District Branch and by such other redistribution as appears advantageous to develop the organizational activities of the District Branches

SPEAKER ANDRESEN That is merely a notice to go on file

Section 172

Reappointment of Planning Committee for Medical Policies

DR J STANLEY KENNEY *Councilor* Under the setup of the Planning Committee for Medical Policies, it is a special committee of the House of Delegates, and it is appointed on a yearly basis Unfortunately there was no time for discussion of a number of important problems that are before the Committee, particularly group practice, which is being studied by the Committee, in collaboration with a similar committee in the American Medical Association also this question of the inclusion of hospitals and medical schools into the practice of medicine The gentlemen on this Committee are well informed in the study and it is a continuing study Therefore I would make the recommendation that the House continue this Committee and have the Speaker appoint its personnel as prescribed.

DR. THOMAS M D ANGELO *Queens* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 173

1949 Meeting of House of Delegates

SPEAKER ANDRESEN We have an invitation here from the delegates from Erie County to have the next State meeting in 1949 in Buffalo

DR JAMES F ROONEY *Trustee* That matter I think under the Constitution and Bylaws has to be referred to the Council

SPEAKER ANDRESEN Yes

DR ROONEY The House may make its recommendation but it must be essentially referred to the Council for their action

SPEAKER ANDRESEN Will you make the recommendation?

DR. ROONEY I will make the recommendation that we accept the invitation of Erie County and that that be communicated to the Council to set the time of the meeting

DR. JOHN B D ALBORA *District Delegate* I second that motion.

There being no discussion the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN I think that completes our business

Section 174 (See 14 137 140)

Special Assessment for War Memorial

DR. JAMES F ROONEY *Trustee* You have voted to establish the War Memorial. You have voted the plan, and I take it that some of you fancy that that carried with it the special assessment to carry it out It did not because that was a separate matter and for that purpose I now move you sir that a special assessment of $12 for each member of the Society be levied and payable within the current year as of this year's dues, the dues and assessment for 1948 payable to the Treasurer of the Society for the purpose of establishing a war memorial fund in conformity with the resolved made in the resolution establishing such fund That means that the fund will be in the hands of the Treasurer of the State Society under the charge of the Board of Trustees and expended only upon the direct authority of the Council of your Society I make that motion

DR. HAROLD B DAVIDSON *New York* I second it

SPEAKER ANDRESEN I will put this in the form of one motion to grant Dr Rooney the floor and second to adopt his resolution We will act on them both at once. Is there any discussion?

DR LEO F SCHIFF, *Clinton* While I, personally, am in favor of this motion, I still feel that this body is too small a body to take an action that is going to affect 20,000 men It is going to create considerable discussion in some of the county societies, and it should be disposed of by a referendum I am not going to make any motion to do anything about it I simply speak of that fact Thank you for the privilege If somebody else is interested enough, he can do it

DR FREDERICK W WETHERELL, *Onondaga* How much would it cost to conduct a referendum of each individual member of the Medical Society of the State of New York?

DR ROONEY May I have the answer to that question?

DR SCHIFF I cannot answer that

DR ROONEY We have had I think, within the period of my being in the House of Delegates for some thirty-odd years, one referendum to the best of my knowledge From my best recollection that referendum cost the Society something in the neighborhood of $5,000, and the responses to that referendum were from less than 10 per cent of the membership

I feel that the referendum is in the Constitution, while we are meeting matters of emergency, but, gentlemen you are sent here as delegates from your own county societies This matter has been under discussion for three years Every member of this State Society must be familiar with it It has been published repeatedly in the JOURNAL The question has been discussed for three years If we are going to gain anything by referendum, very well, I have no objection to the expense, gentlemen, but you will get approximately the same percentage of response to a referendum vote for 21,000 members Don't forget also that to carry on a summary of the tally of that vote will necessitate our employing additional employes in our headquarters to do it That has to be tallied, summarized, and then reported—a postponement of another year

Gentlemen, I leave the decision to you It is your decision I take it that Dr Schiff, as he said, is not proposing to make a motion that a referendum be had I feel we had better dispose of this thing definitely one way or the other now

DR HARRY ARANOW, *Councilor* I have been in this House for a long time We have made decisions of much more importance to the members than $12 We have made very important decisions That is our duty here That is what we are sent here to do, to decide for the 20,000 men that cannot possibly be here

DR HOMER J KNICKERBOCKER, *Ontario* We are the representatives of our county societies What we say goes If you get less than 20 per cent of response to your legislative program, what do you expect from this, another flop?

DR CHARLES GULLO, *Livingston* Dr Rooney, I believe you said you would expect to collect the fee for the balance of the year, correct?

DR ROONEY Yes, that it would be made this year, if the House so decided If I may add, Mr Speaker, through you, that the assessment will be levied for the year 1948

DR GULLO Why I ask you that question is because, from the discussion that preceded this at the time it was introduced, the implication was that in the event that the members of the Society do not pay their fee they are automatically not members of the County and State Societies, but all of the members of the Society as of now have paid their dues, so they are members May I suggest that the collection of this money be extended over a period of twelve months so that it will carry it on into next year You cannot throw out a member that is already a member

DR ROONEY May I answer, Mr Speaker?

SPEAKER ANDRESEN Yes

DR ROONEY I understand that perfectly, Dr Gullo I move that the assessment be levied as of the year 1948 Do you understand now? I realize that your dues and annual assessments would have to be paid before June 30 Am I correct in that? There can be no suspension of membership on an assessment levied now until failure has been made to make that payment upon the next year's dues Is that clear? So that there can be no suspension for failure to pay this assessment, if it is levied, before 1949 We hope, however, that there may be enough men, knowing that the assessment has been made, who will pay so we can begin to take care of three of these children who are now within the age limit when they should be provided for

DR REULING State assessments are collected by the counties and remitted through the counties to the State I want to raise the question—and I think it should be in the motion—how this assessment shall be billed, whether it shall be billed directly from the State office by the treasurer or whether it should be billed through the counties I believe the motion as previously stated by Dr Rooney could probably be restated saying how the money was to be collected and when a man would be considered in arrears if the special assessment is not paid

Might I ask, Mr Speaker, Dr Rooney to reword his motion so that it covers the point?

DR ROONEY I will answer, Mr Speaker, if I may, though I don't think there is any necessity of my answering the question The money can be collected in only one way, and that is specified in the Bylaws and Constitution It will be collected just as dues are collected, through the county societies, and will be transmitted by the treasurers of the county societies to the treasurer of the State Society There is no other provision, and we ought not to constitute a new method It should be assessed against the county society, the secretary to inform the county societies that a special assessment is levied against every member of the Medical Society of the State of New York in the ordinary form and manner that your dues are assessed against you, and have it collected in the same manner in so far as possible during the current year

Now that is a pious wish There is no compulsion about it, and no penalty can attach unless the man fails to pay that assessment outside of the constitutional limits in 1949

DR EZRA A WOLFF, *Queens* I should like to ask a question, Mr Speaker Which members would be liable to this assessment? I am thinking particularly of members coming into the Society within the next year as to when would they be liable for this assessment?

SPEAKER ANDRESEN Can you answer that, Dr Rooney?

DR ROONEY I think the average accretion of membership of this Society now is running approximately 800 a year Am I correct about that, Mr Secretary?

SECRETARY ANDERTON Approximately, yes, sir

DR ROONEY What difference does it make? Any county society can determine for itself just as it determines its dues If a man comes in during such a

period he does not pay dues for that period I know if a man in Albany County becomes a member of the county society in November he is not required to pay county society dues for that period of time until the succeeding year, however he becomes a member of the State Society and becomes responsible for the payment of dues for the current year in which he joins. Am I correct in that Mr Secretary? The county society becomes liable for that man's State dues for the year in which he joins the Society?

SECRETARY ANDERTON Up until the 31st of October

DR. ROONEY If he comes in after the 31st of October he is responsible neither for his Medical Society dues nor will he be responsible for the assessment. The same proviso will hold for this assessment as holds for the dues for the year 1949 We hope however that if the notice that the special assessment is levied is sent out that we may accumulate sufficient money to start the operation of this plan as promptly as may be.

DR. JOHN L O'BRIEN *Bronx* I was on this Reference Committee I don t know whether the chairman is here or not but we expressed in our approval of the report confidence in the men who formed this report and also confidence in the ones who are to finish the formation of this War Memorial, work out the details of it If I remember correctly one of the items contained in our recommendation was that the assessment should be upped to a maximum of $12 We did not state that there should be a specific amount at this time determined, simply because we felt the details of this project were not completed We had an estimated figure from the committee If you take these 58 children under the third plan, and you give them eight years of education at $600 a year you will need $278 400 I think those figures are correct If you collect $12 a year from approximately 21 000 members you will have $252,000 in the fund This will cover all of the possibilities I am sure. With the figure I am giving you, you are paying out the maximum amount that you can pay out. We felt that we had to give some leeway to the men who are going to complete the project in its detail, and they would determine the amount of the assessment that was to be made We could not determine that in an hour and a half at a table after they had probably spent weeks getting this estimate figure of $242 000-odd or whatever it might be.

SPEAKER ANDRESEN That is why we have the motion.

DR. ROONEY May I answer that? I think I can settle that in a minute There was in the recommendation of the committee and that the Council will be authorized to take care of additional sums in cases of need. That is the reason why that $12 was fixed instead of the $11 25 to take care of the provision for some of these children and families who become destitute if the need arises That is all gentlemen

DR. O'BRIEN Your committee in its report left the determination of that figure up to the future

DR. ELTON R DICKSON *Broome* I would like to ask Dr Rooney if he would have any objection to splitting that $12 into two assessments

SPEAKER ANDRESEN It cannot be done We can only do it for one year

DR. ROONEY I spoke about that this morning

SPEAKER ANDRESEN That was explained this morning

There being no further discussion the motion was put to a vote and was carried

Section 176

Vote of Thanks to Exhibitors and Hotel Management

DR LOUIS H BAUER, *President* Mr Speaker before we adjourn I would like to make a motion We, this morning extended our thanks to the various committees, etc. who handled the convention but I would like to move that we extend our thanks to the scientific exhibitors who have gone to considerable time and trouble in preparing these exhibits and to the exhibitors who after all have made this meeting possible, and to the management of the hotel

The motion was seconded by several and as there was no discussion it was put to a vote and was unanimously carried

Section 176

Vote of Thanks to the Speaker

DR. LOUIS H BAUER, *President* This may be horning in on your territory Dr Rooney but I want to move a standing vote of the House to the Speaker for his management of the meeting

DR. ROONEY You did it I knew you would I think I can speak for the House when I say with all due modesty that they admire and respect you for your impartiality and your keenness of decision and your personality

The delegates arose and applauded

SPEAKER ANDRESEN I thank you for this expression. I thank the members also for their patience during this long ordeal and for their generous and earnest consideration of all matters that have been presented here and for their faithful attendance to this late hour

Before adjourning this convention I wish to say that the reason we have had such a smooth running meeting is that we have had such an efficient staff and we have had such superlative help from our reference committees

I thank the Vice-Speaker, the Secretary, Miss Dougherty Mrs Grimm and the other members of their staff for their unfailing and enthusiastic cooperation and the reference committees for their wholehearted support.

I also wish to compliment our sergeants-at-arms for their efficient and long lasting service yesterday afternoon

If there is no further business I have one more announcement The Council will meet at 2 30 this afternoon in Room 111 the Trustees are going to meet in the back of the room for a few minutes now and they can decide when they want to meet again

Section 177

Notice of Intention Generally to Change Constitution and Bylaws

DR JAMES F ROONEY *Trustee* This is notice that I propose to change the Constitution and By laws generally at the next session of the House.

SPEAKER ANDRESEN That has been noted

Is there any further business to come before the House of Delegates?

There was no response

SPEAKER ANDRESEN If not the meeting stand adjourned *sine die*

The meeting adjourned at 1 15 P M

REMINDER

(Courtesy Mother Nature.)

THE TURN OF SUMMER into fall is Nature's most poignant reminder of another year gone by

It's a reminder that should make you think, seriously, that you yourself are a year closer to the autumn of your own particular life

What steps have you taken what plan do you have for comfort and security in those later years?

You *can* have a very definite plan —one that's automatic and *sure*

If you're on a payroll, sign up to buy U S Savings Bonds on the Payroll Plan, through regular deductions from your wages or salary

If you're not on a payroll but have a bank account, get in on the Bond-A-Month Plan for buying Bonds through regular charges to your checking account

Do this stick to it and every fall will find you richer by even more than you've set aside For your safe, sure investment in U S Savings will pay you back—in ten years—$100 for every $75 you've put in

AUTOMATIC SAVING IS SURE SAVING—

U.S. SAVINGS BONDS

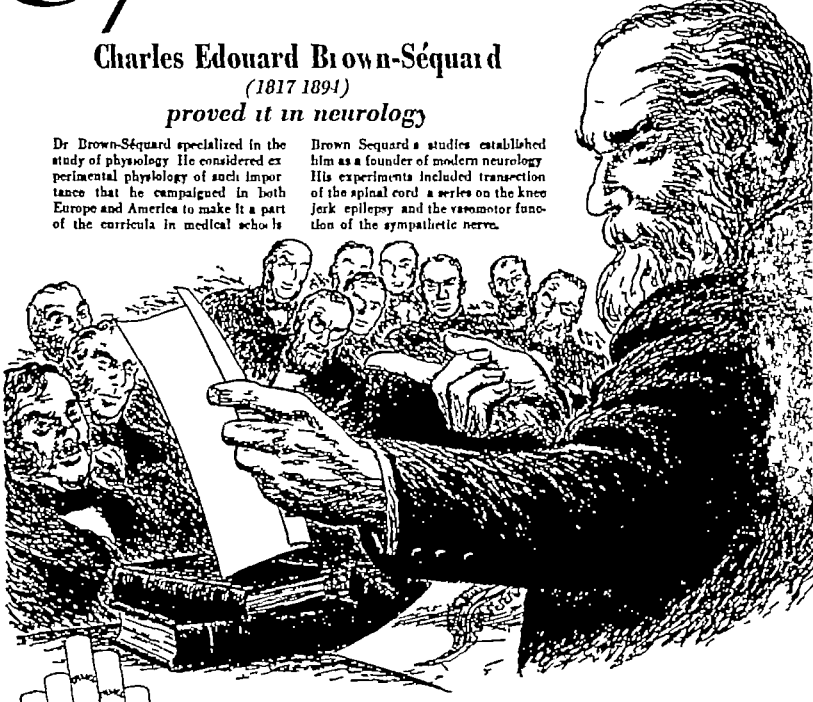
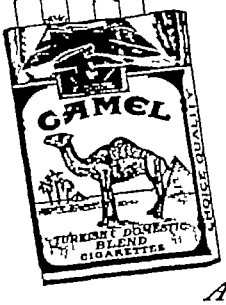
over 30 years of service to the profession

Experience is the Best Teache



Charles Edouard Brown-Séquard



(1817 1894)

proved it in neurology

Dr Brown-Séquard specialized in the study of physiology He considered experimental physiology of such importance that he campaigned in both Europe and America to make it a part of the curricula in medical schools

Brown Sequard s studies established him as a founder of modern neurology His experiments included transection of the spinal cord a series on the knee jerk epilepsy and the vasomotor function of the sympathetic nerve.

Experience is the best teacher in cigarettes, too

YES! Experience counts Millions of smokers who have tried and compared many different brands of cigarettes found from experience that Camels suit them best. As a result more people are smoking Camels than ever before.

Try Camels! See how *your* taste appreciates the rich, full flavor of Camel s choice properly aged, and expertly blended tobaccos. See if *your* throat doesn t welcome Camel s cool mildness

Find out for yourself why with millions of smokers, Camels are the choice of experience."

R. J. Reynolds Tobacco Co. Winston-Salem, N. C.

According to a Nationwide survey

MORE DOCTORS SMOKE CAMELS

than any other cigarette

Three independent research organizations in a nationwide survey asked 113,597 doctors to name the cigarette they smoked. More doctors named Camel than any other brand.

Scorutone

RUTIN with VITAMIN C

For the Control of Increased Capillary Fragility

SCORUTONE is a combination of rutin and ascorbic acid Rutin has been shown to be effective in the treatment of increased capillary fragility Since clinical evidence seems to indicate that it is less effective in the presence of a Vitamin C deficiency, ascorbic acid has been added as a potentiating factor in Scorutone

SCORUTONE tablets are supplied in bottles of 100 tablets, each tablet containing 30 mg of rutin and 50 mg of ascorbic acid Write for detailed information and clinical reports of the successful use of Scorutone to control increased capillary fragility

Undigested fat in stool

"Fatty Indigestion"

One of the chief causes of distress in liver, gallbladder and bile tract disturbances is impaired fat digestion, resulting in flatulence, upper abdominal discomfort, steatorrhea, constipation and related symptoms

Of considerable importance also is the interference with absorption and utilization of iron, calcium, and fat-soluble vitamins—D, E, K and Carotene—leading to well-known deficiencies in these essential dietary factors

Degalol—chemically pure deoxycholic acid—provides Nature's emulsifier to facilitate fat digestion and absorption

In the presence of lipase (which is rarely absent), one or two tablets of Degalol t i d usually suffice to reduce appreciably the symptoms of impaired fat digestion and to allow for absorption of ingested fat-soluble vitamins

Degalol REG U S PAT OFF

Supplied in tablets of 1½ *gr , boxes of* 100

In the Conservative Treatment of

The Lumbosacral and Lower Lumbar Regions

CAMP SUPPORTS offer advantages

...Give firm support to the low back; the support is easily intensified by re-inforcement with pliable steels or the Camp Spinal Brace

...Afford a more stable pelvis to receive the superincumbent load.

...Allow freedom for contraction of abdominal muscles under the support in instances of increased lumbar curve (fig 1).

...Are removed easily for prescribed exercises and other physical procedures prescribed by physiatrist or physician.

FIGURE 1—Patient—thin type of build with beginning faulty body mechanics The Camp adjustment provides a more stable pelvis, allowing patient to "draw in" the abdominal muscles thus gradually acquiring a gentle lumbar curve

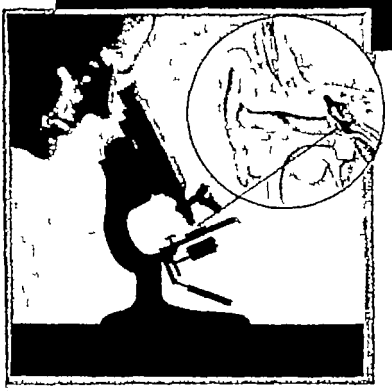

FIGURE 2—Patient—intermediate type of build Strain of lumbosacral joint predisposes to other strains For protection of the joints in the lumbar region from recurrent strain and also as an aid in relieving the pain of acute conditions, Camp lumbosacral supports have proved effective

PIONEERS in Research . . . and Leadership thru the years in combating OTITIS MEDIA

DOHO in realizing the need for a potent, topical, well tolerated ear medication yet mindful that no one formula could be suitable for all conditions devoted every facility and scientific resource to the development and perfection of AURALGAN and OTOSMO-SAN Each has its sphere of usefulness each has been tested and clinically proven in many thousands of cases. *Reprints and sub stantiating data sent on request*

EACH A SPECIFIC . . . both effective!

Auralgan
IN ACUTE OTITIS MEDIA

is a scientifically prepared, completely water free Glycerol (DOHO) having the highest specific gravity obtainable, containing antipyrine and benzocaine which by its potent decongestant, dehydrating and analgesic action provides effective relief of pain and inflammation

O-TOS-MO-SAN
IN CHRONIC SUPPURATIVE OTITIS MEDIA, FURUNCULOSIS AND AURAL DERMATITIS

is not just a mere mixture, but a scientifically potent chemical combination of Sulfathiazole and Urea in AURALGAN Glycerol (DOHO) base which exerts a powerful solvent action on protein matter, liquefies and dissolves exuberant granulation tissue, cleanses and deodorizes, and tends to exhilarate normal tissue healing in the effective control of chronic suppurative otitis media

the NEW spasmolytic and sedative in liquid form

Robins "Donnatal Elixir" marks an important step forward in spasmolytic therapy. Developed for adults and children alike, this outstanding spasmolytic and sedative now greatly widens the range of its therapeutic usefulness.

As an elixir, its exceptional palatability, its ease of administration and flexibility of dosage, together with its prompt, uniform action—all make it the spasmolytic of choice in such pediatric conditions as spastic pyloric stenosis, intestinal colic, diarrhea and enuresis.

Donnatal's comprehensive spasmolytic effect—with an unusually wide margin of therapeutic safety—results from a synergistic combination of small fixed amounts of the principal belladonna alkaloids with phenobarbital. Each 5 cc. (1 teaspoonful) of Donnatal Elixir equals 1 Donnatal tablet in therapeutic effectiveness.

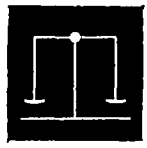
"Donnatal" is the registered trade mark of A. H. Robins Co.

Ethical Pharmaceuticals of Merit since 1878

A. H. ROBINS COMPANY RICHMOND 19, VA.

DOSAGE Infants ½ teaspoonful 2 or 3 times daily as necessary. *Children:* 1 teaspoonful 2 or 3 times daily as necessary. Adults: 1 or 2 teaspoonfuls, 3 or 4 times daily.

FORMULA Each teaspoonful (5 cc.) contains



Hyoscyamine Sulfate	0.1037 mg
Atropine Sulfate	0.0194 mg
Hyoscine Hydrobromide	0.0065 mg
Phenobarbital (¼ gr.)	16.2 mg

AVAILABLE In pints and gallons.

reduces dosage  *to milligrams*

. . . disability  *to hours!*

Simplicity of administration with dosage *by weight* and effect *in hours* —together with virtual freedom from locally induced nausea or vomiting —makes Digitaline Nativelle a preparation of choice wherever and whenever digitalis therapy is indicated

In developing the first clinically proven active principle of digitalis purpurea, Digitaline Nativelle has provided the medical profession with a major advance in the treatment of cardiac decompensation Utilizing the active principle, Digitaline Nativelle acts uniformly whether administered by mouth or by vein

Prescribed for these 5 advantages

1 Uniform potency by weight.

2 Identical dosage and effect when given intravenously or by mouth

3 Virtual freedom from gastric upsets and other untoward side effects

4 Absorption and action is rapid uniform, determinable by the clock

5 Active principle enthusiastically accepted by leading cardiologists

SIMPLICITY OF ADMINISTRATION

RAPID DIGITALIZATION *1.2 mg in equally divided doses of 0 6 mg at three hour intervals*

MAINTENANCE *0 1 or 0.2 mg daily depending upon patient's response*

CHANGE-OVER *0 1 or 0.2 mg of Digitaline Nativelle may advantageously replace present maintenance dosage of 0 1 gm or 0.2 gm. of whole leaf*

Supplied through all pharmacies in 0 1 mg pink tablets and 0 2 mg white tablets — in bottles of 40 and 250. In ampules of 0.2 mg (1 cc.) and 0.4 mg (2 cc.)—in packages of 6 or 50 VARICK PHARMACAL CO INC. (Division of E. Fougera & Co Inc.) 75 Varick Street New York, New York.

Digitaline Nativelle

active glycoside of digitalis purpurea

(*digitoxin*)

Nutritive Capsules

provide prenatal and postnatal protection

They contain mineral vitamin factors often poorly represented in patients' diets
Increased requirements during pregnancy and lactation are well recognized

"CALCIUM which is essential for the proper development of bone clotting of blood, and normal neuromuscular action. "[1]

Each *Nutritive Capsule* supplies 725 mg. of anhydrous Dicalcium Phosphate providing calcium and phosphorus in approximately the same physiologic ratio (1.3 to 1) as in blood and in milk.

"PHOSPHORUS which associated with calcium is the formation of bone but only when present in fixed proportions. "[1]

VITAMIN D "During pregnancy and lactation VITAMIN D is required both for the mother and the child."[2]

Each *Nutritive Capsule* supplies 400 units of vitamin D.

RIBOFLAVIN "... the daily requirement of RIBOFLAVIN is increased in pregnancy lactation and fever"[3]

Each *Nutritive Capsule* supplies 2 mg. of riboflavin.

"IRON which form the iron protein combination of hemoglobin and prevents anemia.

Each *Nutritive Capsule* supplies 30 mg. of Ferrous Sulfate.

"... VITAMIN B requirements are increased in the pregnant and nursing woman."[3]

Each *Nutritive Capsule* supplies 2 mg. of vitamin B_1

Dosage: One capsule three times daily or more if indicated.
Packaging: Bottles of 100 and 1000.

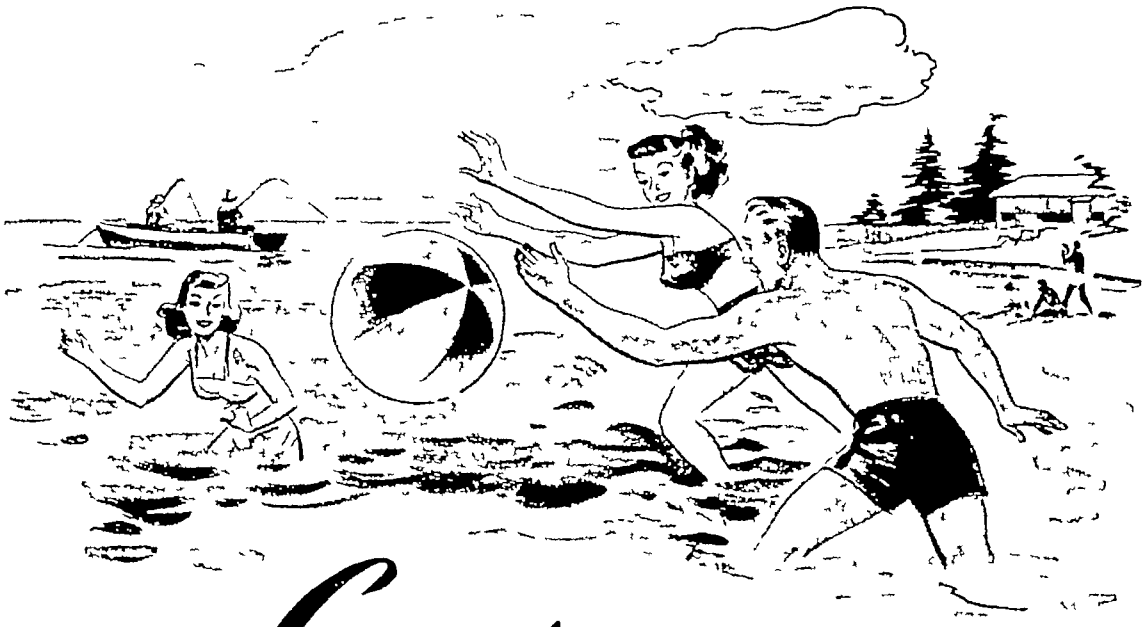
Significant Clinical Results in Certain Allergic Disorders

Extensive clinical investigation has established that

★ *Neo-Antergan* produces EFFECTIVE SYMPTOMATIC RELIEF in a high percentage of patients with certain allergic manifestations

★ This remarkably efficient histamine antagonist possesses a WIDE MARGIN OF SAFETY



★ Patients who fail to respond satisfactorily to other therapeutic methods may receive effective symptomatic relief from *Neo-Antergan*.

The majority of patients readily tolerate the average therapeutic dose of 50 mg., two to four times daily In some cases, 25 mg , two to four times daily, will afford appreciable symptomatic relief with minimal side effects Side reactions, when they occur, have been found to be generally mild and transient. Discontinuance of treatment has been necessary only in *approximately 1½ per cent* of patients

Your local pharmacy stocks Neo-Antergan in 25 mg and 50 mg tablets supplied in packages of 100 and 1 000

INDICATIONS HAY FEVER PRURITUS URTICARIA VASOMOTOR RHINITIS ATOPIC DERMATITIS ECZEMA ALLERGIC DRUG REACTIONS and certain other allergic disorders

Candy AND OUTDOOR ACTIVITIES

MANY persons whose daily work involves relatively little physical exercise are likely to overindulge in outdoor activities during the summer months, particularly during vacation periods This increase of physical activity and energy expenditure must be met by augmented nutrition, the need for which is frequently made apparent by sudden hunger or decreased stamina, both of which call for immediate relief

Candy is a splendid companion for every kind of outdoor activity In addition to presenting readily available caloric value in small bulk, the many candies in the manufacture of which milk, butter, eggs, fruits, nuts or peanuts are used, provide to the extent these foods are contained, complete protein, essential minerals, and B complex vitamins Satiety value, universal taste appeal and its worth while nutritional contribution have made candy a natural companion of recreation

MICRO CRYSTALLINE
DIAZINE
SULFA
MERAZINE

2 HOUR BLOOD LEVELS[1]
ADDITIVE THERAPEUTIC EFFECT[2]
LESS TOXIC[3]

SULFONSOL—A DELICIOUS LIQUID SUSPENSION OF MICRO CRYSTALLINE SULFADIAZINE AND SULFAMERAZINE—Is far superior to bulky tablet medication Each 8 cc. (2 teaspoonfuls) Is therapeu tically equivalent to the standard half gram (0.5 Gm) sulfonamide tablet. Since each drug is present in micro crystalline form a de sired total sulfonamide blood level Is attained in 2 hours instead of the usual 6 hours.

SULFONSOL

micro-crystalline sulfadiazine-merazine

The therapeutic effects of sulfadiazine and sulfamerazine are ad ditive—yet these two drugs are independently soluble in body fluids. Hence their simultaneous administration on the basis of total sulfonamide content constitutes the logical answer to the problem of crystalluria which frequently follows the administration of full doses of either drug alone Furthermore the serious toxic reactions occasionally associated with sulfathiazole such as hema turia are seldom encountered following the use of sulfadiazine or sulfamerazine

Supplied in bottles of 2 4 and 16 fluidounces.

EFFECTIVE URINARY ANTISEPSIS *without* OCCURRENCE OF DRUG-FASTNESS

MANDELAMINE

REG U S PAT OFF

Brand of Hexydaline
(Methenamine Mandelate)

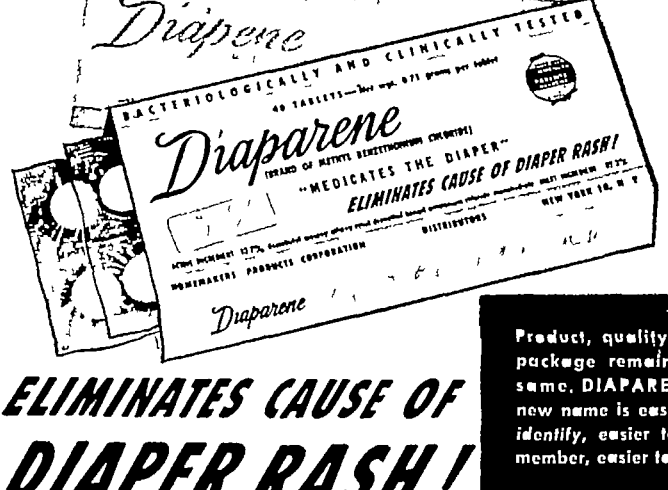
Clinicians recognize that the value of many otherwise effective antibacterial agents is limited by the potential development of drug-fastness

MANDELAMINE* therapy is conspicuously free of this disadvantage[1] [2]—a feature that is especially welcome when therapy is prolonged or must be repeated. MANDELAMINE exhibits a broad range of therapeutic activity, is well tolerated, and is virtually nontoxic in recommended doses

MANDELAMINE offers these **6** outstanding advantages

1 No gastric upset
2 Wide antibacterial range
3 No accessory acidification (except when urea splitting organisms are present)
4 No fluid regulation—no dietary restriction
5 No danger of drug-fastness
6 *Simple oral dosage*—3 or 4 tablets three times a day

SUPPLIED Enteric-coated tablets of 0.25 Gm (3¾ grains) each, in packages of 120 tablets sanitaped, bottles of 500 and 1,000 tablets



*MANDELAMINE is the registered trademark of Nepera Chemical Co., Inc., for its brand of Hexydaline.

Findings from the Saratoga Spa records*

CARBON DIOXIDE BATHS

Many observations have been made on the changes which occur in the alveolar carbon dioxide tension, the skin temperature, and the respiratory metabolism of human subjects who have been submerged in baths of either carbon dioxide water or plain water

The alveolar carbon dioxide tension showed a 5 to 10 per cent rise during baths in the carbon dioxide water, and returned to the resting level about twenty minutes after the bath There was no significant change during baths in plain water

There was no essential difference in the skin temperature during the carbon dioxide and plain water baths

There was a marked increase in the elimination of carbon dioxide in the expired air during the time the patient was in the mineral water bath This increase did not occur in the plain water bath

No evident variation in the oxygen consumption occurred with either bath

The possible source of the excess carbon dioxide is discussed The evidence supports the theory that this extra carbon dioxide is obtained by absorption of the carbon dioxide in the water through the skin and its subsequent elimination through the lungs

It is, therefore, concluded that the results obtained in the treatment of patients with carbon dioxide mineral water baths depend, in part, at least, on the absorption of carbon dioxide through the skin and its subsequent influence on the circulation and nervous system which occurs in the process of its natural elimination by way of the blood stream and the lungs

A new light on vitamin A absorption

Vitamin A from Vifort is absorbed to a noticeably higher degree than vitamin A from fish liver oil. Superior assimilation has been shown in normal children and in patients with impaired vitamin A absorption.

Vifort also offers convenience and economy since it combines, in a single palatable product, generous quantities of both oil soluble and water-soluble vitamins required for nutritional supplementation. Each 0.6 cc. (as marked on dropper) contains the following vitamins: A, 5000 units, D, 1200 units, C, 60 mg., B_1, 1.8 mg., B_2, 0.4 mg., niacinamide, 3 mg., B_6, 0.3 mg., calcium pantothenate, 1.2 mg.

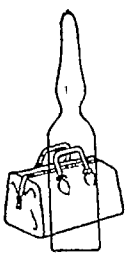
Supplied in 15 and 30 cc. dropper bottles.

Samples sent on request.

Vifort® water-dispersible polyvitamin drops

Endo Products Inc., Richmond Hill 18, N

a diuretic of choice



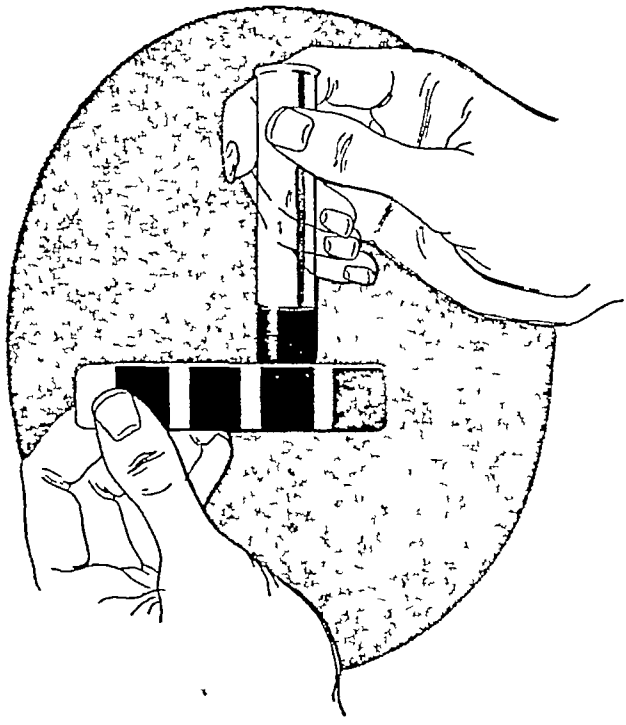
"The mercurials are so often effective that other diuretics are being used less and less. This is especially true of the formerly popular xanthin derivatives [which] often fail"[1]

"During the past decade or so mercury diuretics have come into use and to a large extent are superseding those just mentioned [theophylline, theobromine sodium salicylate aminophyllin]"[2]

"In recent years the xanthine derivatives have been used but seldom as diuretics as a result of the introduction of the more effective mercurial diuretics"[3]

MERCUHYDRIN®

well tolerated locally, a diuretic of choice



embodies the merits which have led to the concurrence of authoritative opinion on mercurials in modern diuretic therapy Mobilization of water binding sodium withdrawal of edema fluid and increase of urine volume check tissue inundation as shown in a recent study with radioactive sodium and MERCUHYDRIN[4]

Clinical efficacy is augmented by suitability for intramuscular injection.[5] The convenience and safety[6 7] of this mode of administration facilitate the recommended frequent-dosage schedules[8] of modern diuretic therapy

MERCUHYDRIN (meralluride sodium solution) is available in 1 cc. and 2 cc. ampuls.

TO RESTORE THE BALANCE

Few therapeutic procedures can be used with such precision and with such assurance of benefit as the modern treatment of diabetes mellitus Not only can the degree of defect in the metabolic capacity of the diabetic be readily determined, but it is easy to increase the patient's capacity if desirable If his own supply of insulin is insufficient to support the normal metabolic load, it can be made adequate by supplementing with Insulin administered hypodermically

For prompt effect—

Iletin (Insulin, Lilly), 40 and 80 units per cc

For sustained effect—

Protamine, Zinc & Iletin (Insulin, Lilly), 40 and 80 units per cc

Intermediate effects may be obtained by suitable admixtures of Insulin and Protamine Zinc Insulin

Doctors and the Selective Service Act

As enacted, the Selective Service Act of 1948 states, "No person shall be inducted for training and service unless and until he is acceptable to the armed forces for such training and service and his physical and mental fitness for such training and service has been satisfactorily determined under standards prescribed by the Secretary of Defense.

"No person shall be inducted until adequate provision shall have been made for such shelter, sanitary facilities, water supplies, heating and lighting arrangements, *medical care and hospital accommodations for such person** "[1]

In the absence of an adequate medical staff, the obvious alternative would be to hold up inductions pending the acquisition of sufficient medical personnel or to amend the act

Says the New York *Times* [2]

In addition to the 3 900 young medical doctors the Army needs 1 300 interns and resident physicians or a total of 5,200 medical graduates. For the proper care of 1 360 000 troops, the Army Medical Department has set its sights at 6 900 doctors It now has 3,000, including interns At least 450 veterinarians are needed for food inspection

There was not official announcement of the Army determination to seek the change in the Selective Service Law, but officials, cognizant of the problems of young doctors, believed they should be on notice however informally of the inevitability of inducting large numbers of them.

Revision of the Selective Service Act of 1948 would have to await the convening of the next Congress in January, 1949 and would then drag through a month or so of debate It seems unlikely to us that such a revision of the act will be necessary even though Army officials believe that faced with the certainty of a draft many young doctors and dentists would want to volunteer for active service to qualify for the many unusual incentives recently authorized Congress raised the pay of all medical

* Italics ours—Ed.
[1] Public Law 759 80th Congress, Chapter 625, 2nd Session approved, June 24 1948 p. 2.
[2] Aug. 12, 1948.

officers by $1,200 a year, or to $380 a month for a year's internship In addition, young doctors are commissioned as first instead of second lieutenants

The A M A has already called on young doctors educated during the war at government expense to volunteer for service under the new draft law "They owe an obligation to the government and to the people of the United States," the *Journal* said editorially The *Journal* termed the need for medical services in the armed forces "exceedingly critical," saying nearly 6,000 physicians will be required within a year

Most of the young doctors who served in the last war are "not inclined to volunteer," the editorial said It added that many were "bitter in their recriminations as to faults which they observed in utilization of the medical profession"

"However," it went on, "some of these faults were so obvious that military leaders have already taken steps to bring about correction"

The *Journal* said there were "thousands of young men who were educated at government expense in the A S T P and the V-12 programs who did not render actual military service" The positions open, the *Journal* said, "should appeal particularly to the young men who have graduated in recent years, since they offer opportunity for training in a specialty with an adequate income, housing, and maintenance, not available through any other source"

Should an amendment to the law become necessary in 1949, it is probable that such legislation would not name doctors, dentists, or veterinarians as such but would direct the President to order the registration and induction of personnel "having the professional skill and training to provide for the proper implementation of an expanded military establishment"

The medical profession has never yet failed to meet its obligations to the armed services of the nation In spite of the unusual circumstances of a peacetime draft, we believe that the profession will fulfill its obligations on a voluntary basis

,Health Deficits Studied

Careful analysis of the work done by the more than 800 representatives of medical, public health, and nonmedical groups composing the National Health Assembly, May 1 to 4 of this year, will convince the serious student of the health needs of the country that much was accomplished F S A Administrator Ewing and Dr Howard Kline appear to have been chiefly responsible for the well chosen personnel of the final executive committee of thirty-nine persons with official representation for the American Hospital Association, the American Dental Association, the Conference of State and Provincial Health Officers, the American Medical Association, and similar bodies

In this assembly the American Medical Association was represented by competent experts in each of the fields concerned Several members of the Council on Medical Service participated in the panel on medical care Chairmen in several sections, notably maternal and child health, research, local health units, medical care, physical medicine, hospital facilities, and mental health, were distinguished Fellows of the American Medical Association Members in adequate numbers served on the panels devoted to rural health, community organization, public health, hospitals, personnel, and environmental sanitation The Association had available, moreover, its public relations and publicity staff and additional members on the executive committee [1]

The objectives as stated by Mr Ewing in terms of deficits were sharply defined

> First, we need action in areas of shortage—manpower, hospitals, public health organization, and facilities The findings of the Assembly made it all too clear that we do not have enough doctors, dentists, nurses, medical technicians, and public health workers of all kinds We do not have enough hospital beds, particularly for mental cases and for the victims of heart disease We are short on public health facilities One third of the 3,070 counties of the nation do not have a full-time public

[1] J A M A 137 146 (May 8) 1948

health officer In those that do, only 3 4 per cent of the people are served by health depart ments with enough staff and facilities to meet accepted minimum standards

In addition to shortages, we have bad distribution Shortages are more acute in some states and regions than others, more acute in rural areas than in big cities more acute among Negro Americans than among white Americans. We need to expand our profes sional schools and training centers, rai e the standards of many of them, make it possible for able and ambitious young people to finance their professional education [1]

Second, we need to take definite steps to abolish discrimination in training and in health service. Here education is the crux of the problem Obviously, an ignorant nation cannot be a healthy nation We need to re vamp our scheme of things so that the 6 000 000 children of school age who are not now in school will have their fair chance

Third, we must solve the problem of paying for medical care, so that the costs of sickness will not break the backs of families and so that modern medical care to prevent illness and conserve health will not be beyond the reach of the average family budget This was one of the great new areas of agreement staked out by the Assembly Distinguished spokesmen for the American Medical Association joined with representatives of labor, farmers consumers, and other groups in declaring that the prin ciple of contributory health insurance should be the basic method of financing medical care for the large majority of the American people"

There are various alternatives proposed for action here. I myself am on record as favoring compulsory health insurance but I am not intransigent National health insurance is not a goal in itself I see it as the best method of reaching the real goal—to bring medical care to all the people If anyone can show me a better method I'll switch like a shot

Doubtless the report of the executive committee charged with the final responsi bility for evaluating the recommendations from the different panels and sections will propose specific ways to meet the health deficits of the nation While the areas of agreement noted by Mr Ewing are large, they are not, in our view, by any means wholly cultivated

As this is written, the likelihood of a change in the administration of the govern ment of the United States looms as a possi bility Both the suspect National Health Conference of 1938 and the National Health Assembly of 1948 were sponsored by the same political party Mr Ewing called the 1948 Assembly in response to a request by the President of the United States for a long-range health program to cover the next ten years The effect of a putative change in the political party in power on the conclusions reached by the current Assembly may be far reaching It might well serve to reduce still further the remaining areas of disagreement, the chief one of which is the matter of compulsory health insurance, to which the current administration has been committed, if not by conviction at least by inheritance

Continually worsening diplomatic rela tionships in Europe must not be casually dis counted Considering the obligations this nation has assumed for the implementation of the Marshall plan, we would seem to be committed to a more and more difficult task For assuredly the E R P is basic in reducing the health deficits in Western Europe We are thus inextricably involved in both a foreign and a domestic health prob lem, neither one of which can be wholly separated from the other

Domestic increases in the cost of living, the critical situation both with respect to finances and personnel, of our voluntary hospitals, and the peacetime selective service act with its inevitable requirement of more physicians add urgency to the necessary evaluation of our domestic health deficits.

[1] The Survey Midmonthly June 1948 p. 183.

Current Editorial Comment

The Status of Penicillin Treatment of All Forms of Syphilis The myriad forms it may assume in the human body has made syphilis and its treatment subjects of pro found interest and importance to every doctor of medicine, whether general prac titioner or specialist The review by Altshuler *et al* of the total knowledge ac-

cumulated at the end of the first four years of its use acknowledges that today our principal weapon against syphilis is penicillin [1] Under many headings, containing a wealth of facts and details concerning penicillin in the therapy of all forms of syphilis, the authors consider its chemistry, pharmacology, toxicity, unpleasant reactions, penicillin resistance, effects on syphilis of penicillin used against other diseases, the results in 18 forms or clinical types of syphilis treated with penicillin, concluding with post-treatment observation

The preparation most effective against syphilis of any type in man is crystalline penicillin G It should be dissolved in sterile water or isotonic sodium chloride solution, 50,000 to 100,000 units per cc , and injected in doses of 20,000 to 100,000 units every two or three hours, day and night All doses should be given intramuscularly The duration of one course of treatment should never be less than seven and one-half days (60 doses) Some serious cases of neurosyphilis may require a course of twelve to twenty days and a total dose of 10 to 20 million units (180 or more doses), together with induced malarial fever

Of the 18 types of syphilis treated with penicillin, the results were good in nine early, latent, benign late, iritis, congenital, asymptomatic neurosyphilis, symptomatic neurosyphilis, acute syphilitic meningitis, and syphilitic nerve deafness In dementia paralytics, the results were moderately good, in cardiovascular and in optic atrophy, undetermined, keratitis, uncertain, tabes, variable, diffuse meningosyphilis, fair, epilepsy, questionable, Erb's spastic paraplegia, poor, and in the prevention of prenatal syphilis, the results are excellent

Other pertinent observations include the following In the treatment of syphilis, do not administer penicillin by the oral route, do not use penicillin by the intrathecal route, since penicillin is relatively nontoxic for man except when administered intrathecally Crystalline penicillin G in peanut oil and beeswax may be used in doses of 600,000 units intramuscularly once a day for ten days, a total dose of 6,000,000 units The reports of serious reactions to amorphous or purified penicillin are rare and include no deaths Penicillin treatment for gonorrhea may delay or suppress the lesions of syphilis Ajuvant therapy with arsenic, bismuth, or fever should not be used with penicillin during the first course of treatment, but they may be helpful and necessary in treatment of relapses In preventing prenatal syphilis, penicillin is nearly 100 per cent effective If the infant is seronegative and otherwise normal at four months of age it may be dismissed as nonsyphilitic

Those treated for early syphilis or infantile congenital syphilis or pregnant women with syphilis should return once a month for a careful inspection and examination and for blood serologic tests for syphilis quantitatively titered Seroresistance after penicillin is the rule in late latent syphilis as it is after all other forms of treatment In neurosyphilis, the two most important tests of the spinal fluid are the cell count and the quantitative estimation of protein In neurosyphilis, the spinal fluid should be retested every six months for a period of two to three years and annually for the duration of life This excellent report deserves to be rated as a reference work for handy use in every doctor's library

Photoroentgen Findings at Annual Meeting The New York State Department of Health has informed the JOURNAL of the results of its first chest survey project during the Annual Meeting of the Medical Society of the State of New York, 1948

> The State Health Department's photoroentgen equipment, which was on exhibit at the Annual Meeting of the State Medical Society during May 17–21, x-rayed the chests of 608 persons, of whom 381 were physicians Shadows indicative of pulmonary tuberculosis were found in nine individuals, or 1 5 per cent of the total number examined In every case, however, the tuberculosis was considered to be probably inactive In addition, six persons showed evidence of significant nontuberculous, intrathoracic abnormalities, among whom were two with possible cardiovascular disease and one suggestive of new growth

Total attendance at the meeting was approximately 6,000 persons, 10 per cent of whom availed themselves of the opportunity provided by the State Health Department That 381 physicians out of the 5,251 who attended the meeting took time to have their chests x-rayed is gratifying

We hope that the State Department of Health will consider repeating this feature of its exhibit at the next annual meeting

SURVEY OF RAGWEED POLLINATION IN THE NEW YORK METROPOLITAN DISTRICT IN 1947

EUGENE H WALZER M D BERNARD B SIEGEL, M.D ROBERT A CHAIT M D and MATTHEW WALZER, M D Brooklyn New York

(From the Division of Allergy Jewish Hospital of Brooklyn)

IN 1946, the first extensive survey of ragweed pollination in the New York Metropolitan District was reported [1] The study was made in collaboration with the Pollen Committee of the Research Council of the American Academy of Allergy

Because ragweed pollination in New York and neighboring states proved to be light and atypical in 1946 the objectives of the investigation, as enumerated in the previous report, were not achieved It became apparent that conclusions could not be drawn on many phases of the problem until data were collected for several seasons in which pollination could be studied under vary ing weather conditions It was decided, therefore, to continue annual surveys of ragweed pol lination for several years

In this communication the results of the rag weed pollen survey of the New York Metropolitan District in 1947 are presented

Technic

The technic employed was that recommended by the Pollen Survey Committee of the American Academy of Allergy [2] Slides with a thin coating of vaseline were exposed for twenty four hour periods in the Durham shelter The slides were stained with Calberla's solution, and the pollen grains under a cover slip (4.84 sq cm.) were counted under the low power objective of a microscope. Pollen counts were reported in terms of the number of ragweed granules found on a square centimeter of slide after a twenty four hour exposure. Approximately 1 000 slides were counted by two of the authors. The margin of error was minimized by frequent checks on the same slides by both observers.

Location of Exposure Stations

The area surveyed was arbitrarily divided as follows (1) New York City, (2) localities within a 50-mile radius of the approximate center of New York City and (3) cities outside the 50-mile radius.

The sites and localities selected for exposure of slides were as follows

New York City

Bronx Montefiore Hospital Manhattan Belvedere Tower in Central Park Staten Island Sea View Hospital Brooklyn Jewish Hospital of Brooklyn Queens—Jamaica Jamaica Hospital Flushing Chamber of Commerce Building Rockaway Rockaway Beach Hospital

Localities Within a 50-Mile Radius

New Jersey—New Brunswick St Peter's General Hospital Maplewood Fire Station Building, Verona Five-story apartment build ing Teaneck Five-story apartment building

New York State.—Croton-on-Hudson Three-story high-school building, White Plains White Plains Hospital Garden City, Long Island Coast Guard Weather Station.

Cities Outside the 50-Mile Radius

Connecticut—Waterbury Waterbury Hospi tal New Haven Grace Hospital.

For purposes of comparison pollen counts were also obtained for Washington D C from Dr Eloise Kaulin and for Philadelphia, Pennsylvania from Dr George Blumstein. Both workers employed the same standard technic.

In most instances the exposure sites were the same as those used in the 1946 survey An old type shelter which had been employed for expos ing slides for about twelve years was placed along side the standard Durham shelter on the roof of the Jewish Hospital of Brooklyn In this man ner, the results obtained with the old and new technics could be compared

Results

The daily counts at the various stations are graphically portrayed in Fig 1 representing the

Presented at a meeting of the New York Allergy Soci ty May 6 1948.

Aided by a contribution from the Celia Antonoff Research Fund.

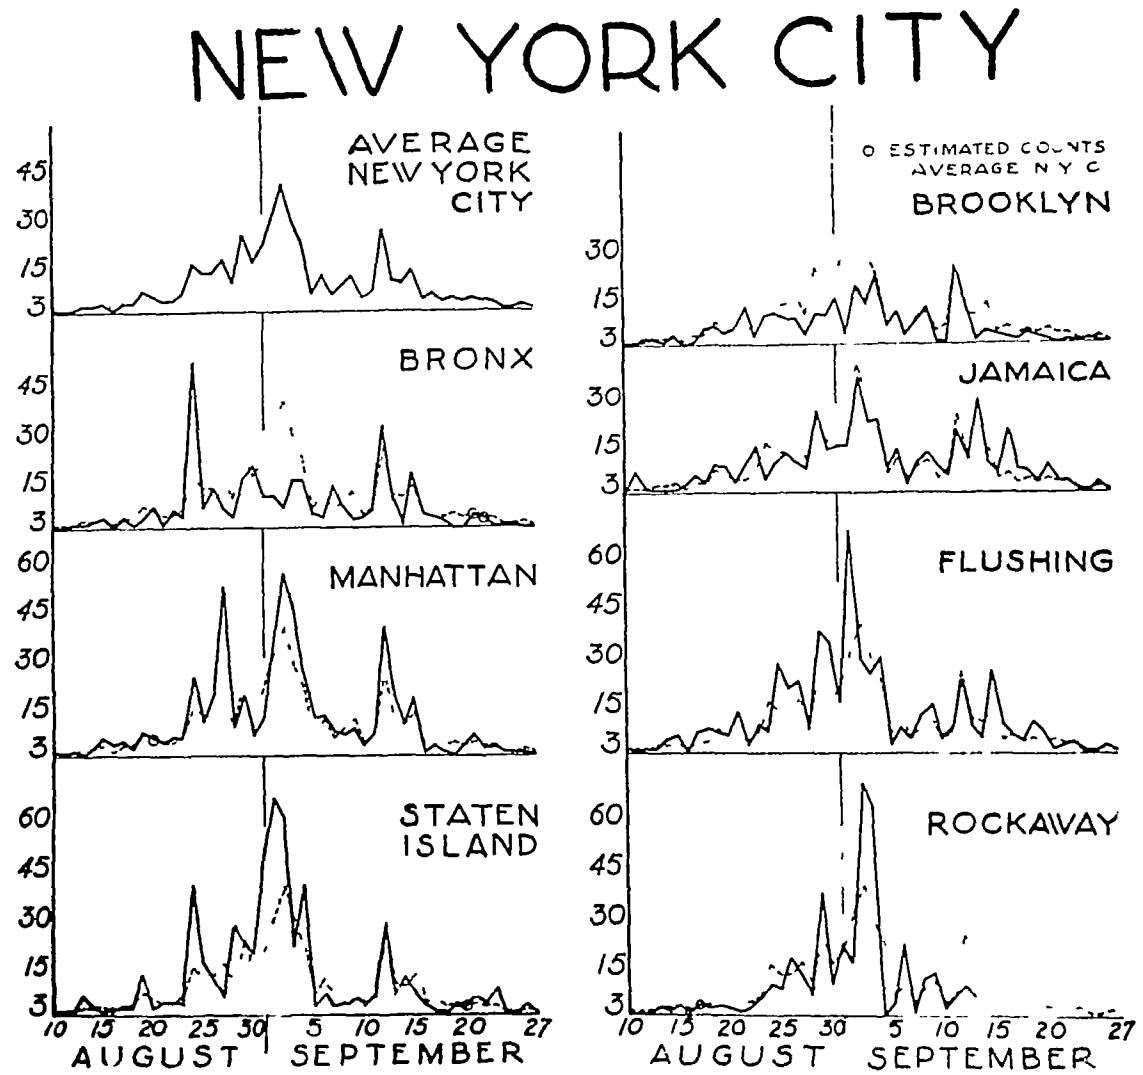

FIG 1

stations within New York City, and in Fig 2, representing the stations within a 50-mile radius of the center of New York City The daily figures noted in the charts represent the number of ragweed pollen granules per square centimeter of slide per twenty-four hours Circles represent days on which the pollen counts were unobtainable For these days, pollen counts were estimated by averaging the counts obtained in the surrounding areas In this way the statistical error which resulted from the loss of a reading was minimized The vertical line extending through the middle of each graph separates the months of August and September

Although counts were done at most of the stations from August 1 through September 30, the pollen charts shown include only the period from August 10 through September 27

Figures 3 and 4 represent the seasonal totals, which were the sums of the daily pollen counts obtained from August 1 through September 30 Where seasonal totals were incomplete, the missing counts were estimated, such readings being represented by the extensions beyond the dotted lines within the blocks

New York City

The daily pollen counts for the seven stations in New York City were averaged and used to plot a curve for the entire city from August 10 to September 27 inclusive (Fig 1) The first traces of ragweed pollen in New York City appeared on August 1 Pollen concentration was minimal until August 24, when an average count of 15 was obtained On August 29, an average of 23, the highest for the month, was recorded The peak of the season occurred on September 2 with a

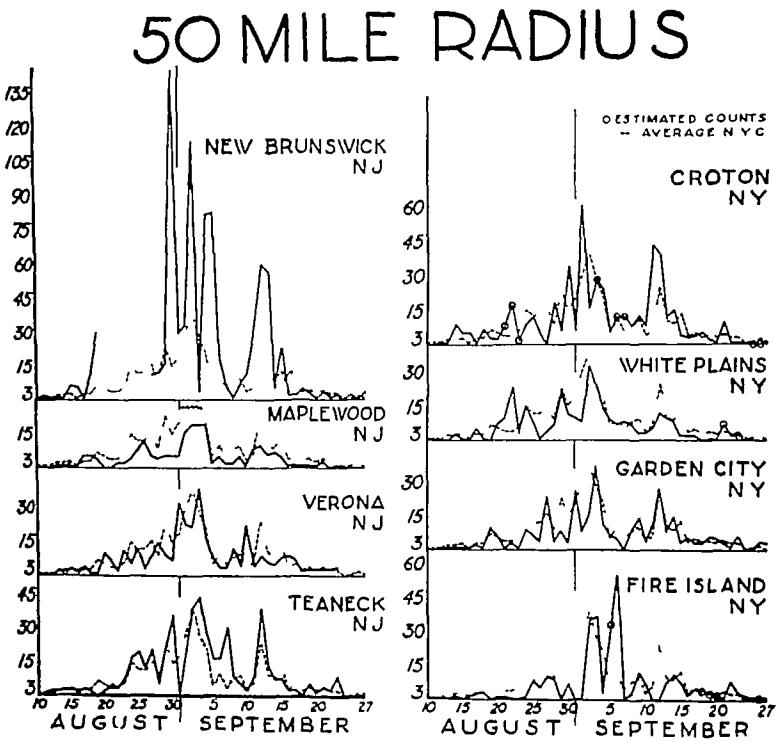

FIG 2

count of 39 By September 5 the count had dropped to five and remained low On September 12 there was a secondary rise to 25 Thereafter only traces of pollen were detected The seasonal total of the average daily counts for New York City from August 1 to September 30 was 423 (Fig 2)

The highest count for the season (50) in the Bronx occurred in August The early September peak seen in the curves of most of the other New York City stations was absent in the Bronx. The seasonal total for the Bronx was 310

The Manhattan pollen curve followed the average New York City curve rather closely although the peaks were of a greater magnitude. The seasonal total (508) was greater than the average for New York City (423)

Staten Island had the greatest pollen density in the city (530), which was about 20 per cent higher than the average for New York City The pollen curve was similar in contour to the average New York City curve but showed higher peaks

Brooklyn had low counts during August and early September with the highest count appearing in mid-September The seasonal total at this station (271) was lower than the New York City average

At Flushing in Queens the peaks were of a higher order than in the average curve and several minor spills were noted in mid-September The seasonal total was 518 At Jamaica and Rockaway in Queens similar curves were noted The seasonal totals at these stations approximated the average New York City total (423)

Localities Within a 50-Mile Radius

New Jersey (Figs 2 and 4)—New Brunswick pollen counts were the highest recorded in the

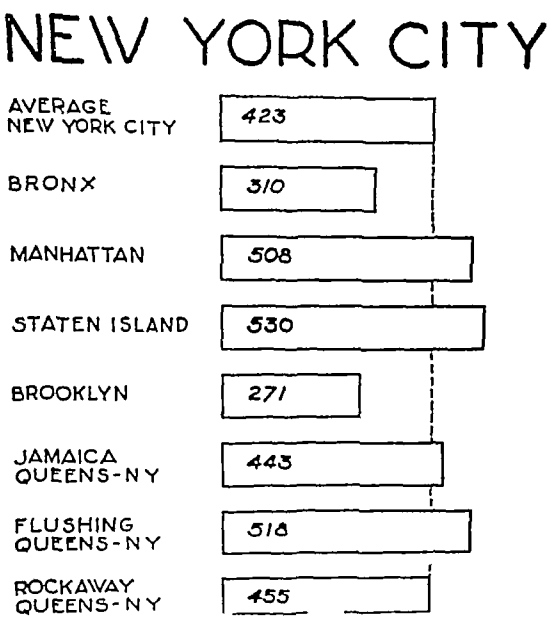

FIG 3

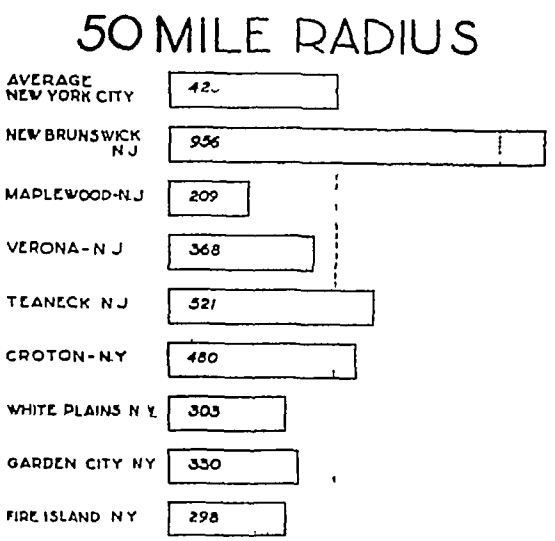

FIG 4

entire survey As a result of damage to the slides, no counts were available for the week starting August 20 On August 30, the count was 144, the highest reading of the entire metropolitan survey The estimated seasonal total at New Brunswick was 956, about twice the average for New York City (423)

Maplewood had the lowest pollen concentration of any station of the metropolitan area The seasonal total (209) was about one half the average for New York City

The pollen curve at Verona was similar to the average New York City curve The seasonal total here was 368

The peaks at Teaneck were somewhat higher than in the average New York City curve The seasonal total of 521 in Teaneck exceeded the average of New York City

New York State (*Figs 2 and 4*) —At Croton the peaks of the pollen curve and the seasonal total (480) were slightly higher than the average of New York City

Except for pollen spills during the third week in August, the White Plains pollen curve followed the average New York City curve closely at a slightly lower level The seasonal total at this station was 303

The Garden City pollen curve also followed the average New York City curve at a somewhat lower level The seasonal total here was 330

Except for several significant pollen spills during the first week of September, counts at Fire Island were low The seasonal total at this station (298) was substantially lower than the averages for New York City (423)

Cities Outside the 50-Mile Radius

The seasonal total (192) for Waterbury, Connecticut, was lower than any recorded in the metropolitan survey The pollen density for the season in New Haven, Connecticut, (434) was approximately equal to that of New York City (423) The Washington, D C, total (585) exceeded that of New York In Philadelphia, the seasonal total of 708 was almost twice the average for New York City

Counts Obtained with Old Shelter in Brooklyn in 1947

Slides were exposed in the old shelter on the roof of the Jewish Hospital of Brooklyn during this survey as they had been each year since 1936 With this technic, the 1947 seasonal total (782) was 44 9 per cent of the twelve-year seasonal average (1,741)

Discussion

Within New York City, ragweed pollen density in Brooklyn and the Bronx was less than that of the average for the city as a whole (Fig 3) Seasonal totals at Jamaica and Rockaway were approximately equal to the average for New York City, whereas Manhattan, Flushing, and Staten Island totals were greater than the average for New York City

Of the stations within a 50-mile radius of New York City, the seasonal totals at Maplewood, Fire Island, White Plains, Garden City, and Verona were all lower than the average for New York City (Fig 4) The pollen density in Cro-

ton and Teaneck exceeded the New York City average. The highest seasonal total recorded in this survey was noted in New Brunswick, New Jersey

At most of the stations included in the survey, three pollen spills were noted in 1947 The first occurred during the last week in August, the second, the highest of all, occurred during the first week of September, and the third, during the second week of September

Throughout most of the season the daily counts at Fire Island, considered to be a hay fever resort, were low On only three days in early September did the counts exceed 35 On the basis of seasonal totals, however, the pollen density was lower in Brooklyn and in Maplewood than it was at Fire Island

As in 1946, the 1947 ragweed pollen crop was light in New York City and its environs. The seasonal total (782) obtained with the old shelter in Brooklyn was only 44.9 per cent of the average for the last twelve years (1,741) The years 1946 and 1937 also showed low seasonal totals, with 50 8 per cent and 40 3 per cent, respectively, of the twelve-year seasonal average.

The paucity of pollen in 1947 was reflected in other eastern cities. In Philadelphia, Washington, D C , Waterbury, New Haven, Verona, and Croton, counts did not differ much from those obtained in 1946, which was also a year of light pollination

Weather factors which may have contributed to the low counts in New York include an excess of rainfall in August and low wind velocity during most of August and early September

It is not yet possible to evaluate the influence of the ragweed extermination program, conducted by the New York City Department of Health, on the ragweed counts in this city The ragweed elimination campaign in New York City during 1947 was reported to be more intensive than in 1946 Despite this fact, counts at four of five stations within the city were higher in 1947 than in 1946 Ragweed extermination programs were not carried out at Verona Croton Waterbury, and New Haven, and for these cities, seasonal totals were also slightly higher or approximately the same in 1947 as in 1946 However, Philadelphia and Washington D C with incomplete ragweed extermination campaigns showed lower seasonal totals in 1947 than in 1946 It is obvious that in 1947 counts were generally low along the coast in Connecticut New York, New Jersey Pennsylvania, and Washington, D C., as they had been in 1946 Such atypical seasons are unsuitable for determining the effectiveness of extermination campaigns, and it will be necessary to continue pollen surveys through heavy pollination years before any conclusions may be drawn on this question.

Summary

1 The ragweed pollen survey of New York City and its suburbs first performed with a standard technic in 1946, was repeated in 1947

2 The pollen density in this area was comparatively low in 1947 Seasonal totals for the metropolitan stations in the order of decreasing pollen density were Staten Island Flushing, Manhattan, Rockaway, Jamaica, Bronx and Brooklyn.

3 In the area within a 50-mile radius of the center of New York City it was found that the seasonal totals at New Brunswick and Teaneck were greater than the average for New York City The Croton total was about equal to the average of New York City At Verona, Garden City White Plains Fire Island and Maplewood the totals were less than the New York City average

4 Ragweed pollen density in New York City and cities in the neighboring states on the Atlantic coast was generally light in 1947 Because of this fact, the effectiveness of ragweed extermination campaigns in this area cannot be evaluated at this time

EVERY PHYSICIAN A COLUMNIST

Members of the Lake County (Indiana) Medical Society are finding out what a columnist's life is like. A group selected from their ranks prepares a daily health column called "Your Doctor Says," appearing in the *Gary Post Tribune* Panel membership is changed every month, so that the whole medical society will eventually have taken part in the scheme.—*Medical Economics July 1948*

STREPTOMYCIN IN DERMATOLOGY ITS VALUE AND LIMITATIONS

FRANK C COMBES, M D , ORLANDO CANIZARES, M D , HARRY SHATIN, M D , and CARL KAUFMAN, M D , New York City

(From the Department of Dermatology and Syphilology of the Third Medical [New York University] Division, Bellevue Hospital, and Section of Dermatology and Syphilology of the Veterans Administration Hospital, Bronx)*

SELMAN A Waksman, a soil microbiologist, in the late 1930's undertook a study of cultures of micro-organisms from the point of view of antibiotic activity of their metabolic products In 1943 he found an actinomycete, namely Streptomyces griseus, which was capable of producing a powerful antibiotic substance When certain strains of this organism were grown on a suitable medium, a purified, active principle could be obtained This substance, designated "streptomycin," showed definite bacteriostatic activity in vitro against many gram-negative bacilli and against the turbercle bacillus It was also found to be of value in certain experimental infections in animals This discovery was announced in January, 1944 [1] Its clinical possibilities were immediately appreciated, and within a year Hinshaw and Feldman of the Mayo Clinic reported the suppressive effect of streptomycin on tuberculosis in guinea pigs and humans [2 3] Comprehensive clinical trials were subsequently undertaken by the National Research Council [4 5] By the middle of 1946 its indications, as well as its limitations and toxicity, were becoming evident The Veterans Administration, the Army, and the Navy have since been engaged in a joint investigation of streptomycin in the treatment of tuberculosis More than 900 patients were reported on in 1947 [6 7]

We have attempted to consolidate in this paper the results, as available in the literature and in our own experience, of the use of streptomycin in conditions of interest to the dermatologist

General Indications

Streptomycin is rapidly finding its rightful place as an antibiotic In general, it does not appear to enjoy the wide field of usefulness possessed by penicillin, although it has a bactericidal effect against some gram-negative pathogens which are penicillin-resistant, against Mycobacterium tuberculosis, which is likewise not susceptible to penicillin, and in both the systemic and localized types of tularemia against which penicillin is useless Furthermore, it is active against some gram-positive bacteria, including penicillin-resistant and sulfonamide-resistant strains of streptococci, staphylococci, and diplococci

Quite naturally the clinician attempts to compare its administration with that of penicillin This is fraught with considerable difficulty because of fundamental differences in dosage measurement (unit or gravimetric), size (by weight the effectiveness of penicillin is about 200 times that of streptomycin), rate of absorption, excretion, distribution in the body, toxicity, etc Streptomycin solutions are much more stable than those of penicillin and are very alkaline Streptomycin activity is greatest at about pH 9 in contrast to penicillin which manifests its optimum therapeutic effects between pH 6 3 and 6 8 This is important in their topical use

Dosage determination of streptomycin is extremely important, especially as regards its adequacy Variations in susceptibility of pathogens is great, sometimes greater between different strains of the same species than between different species Inadequacy of dosage not only fails to effect a cure but is prone to produce streptomycin resistance in a previously sensitive strain

One cannot, therefore, be too dogmatic concerning dosage other than to recommend that one should determine the type of organism responsible for the infection at hand and administer the total twenty-four-hour daily dosage, as advised, in divided portions at intervals of three to four hours for the prescribed number of days or weeks Failure of a sustained favorable response during continuous therapy may indicate development of bacterial tolerance and necessitate doubling the daily dose or its supplementation by other specific or nonspecific measures

While usually administered as the hydrochloride or sulfate salt by intramuscular injection, streptomycin has been given intrathecally and by inhalation as an aerosol We will limit our discussion of dosage to those conditions of dermatologic interest

Dermatologic Indications

Chancroid —Mortara and Saito found Hemophilus ducreyi remarkably sensitive to streptomycin in vitro [8] Working with rabbits, they were able to prevent formation of experimental chancroid following the intradermal inoculation of a virulent strain If they delayed injection of

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City, Section on Dermatology and Syphilology May 21, 1948

streptomycin, lesions developed but healed faster than those of controls.

Hirsh and Taggart treated 15 patients in an attempt to verify clinically the results of animal inoculation.[9] The patients presented ulcerations bubos, or both Treatment consisted of 1 Gm daily in divided doses every four hours intramuscularly, except in one patient who received 2 Gm daily Treatment was continued until there was evidence of complete healing (five to twenty five days), the larger and multiple lesions healing more slowly These investigators found that recovery was facilitated if the fluctuant bubo was aspirated. There was only one possible relapse occurring six weeks after termination of therapy Thus was in a patient who had received 5 Gm They conclude that doses of 1 Gm daily for short periods are sufficient, that treatment should continue for at least seven days and that sulfonamides are the drugs of choice, but streptomycin is of value in patients not responding or who are sensitive to sulfonamides

Erysipeloid.—There are no clinical reports in this disease Klauder and Rule and Woodbine have investigated experimental Erysipelothrix rhusiopathiae infections in mice.[10 11] However mice develop a septicemic form of infection, it being impossible to produce a cutaneous form of infection corresponding to erysipeloid in man There was some evidence of benefit from streptomycin, but it was only relative in that mice receiving higher doses lived longer than control animals

Gonorrhea.—Although not primarily a disease of dermatologic interest, gonococcal infections are included because of their association with keratoderma blenorrhagicum

Pulaski reported seven cases of gonorrheal urethritis which responded promptly to a course of streptomycin consisting of 0 5 Gm every three hours for six doses.[12] All these patients had failed to respond to penicillin and sulfonamides

Chinn Putnam *et al* reported on 77 cases treated with a single dose of streptomycin in saline given intramuscularly 50 patients receiving 0.3 Gm. or more, showed 100 per cent cure 22 treated with 0 2 Gm showed 90 0 per cent cure and 5 treated with 0 1 Gm showed 40 per cent cure.[13]

Granuloma Inguinale.—Barton and his group reported on three cases treated with streptomycin.[14] One received 20 mg every three hours for forty-one days (0 46 Gm.) Improvement began the eighth day, healing was complete by the thirty-third day, and the patient showed no evidence of relapse two and one-half months after completion of therapy Two other patients received 30 mg every three hours, one for eighteen days the other for twenty-nine days. Healing was evident by the tenth and ninth days respectively, and was complete except for pin point erosions, on the thirty third and thirty first days, respectively However within another two weeks these pinpoint openings had increased in size

Greenblatt Dienst *et al* in 1947 reported on 58 patients.[15] Various dosages were used initially but later a more uniform dosage was finally adopted, consisting of 4 Gm. daily for five days in divided doses This larger dose within a short period was used to prevent development of resistance In three patients with excessive granulation tissue, therapy was continued from ten to thirteen days Response was rapid with objective evidence of healing apparent in forty-eight to seventy two hours, complete healing occurring one to two weeks after termination of therapy Extensive lesions progressed to healing more slowly Four patients relapsed Of these two had received less than 4 Gm total dosage but responded to a second more extended course One did not respond to a second course and one received 40 Gm. with only moderate response

We have treated five patients Three received 20 Gm in five days All showed rapid improvement with healing of the lesions and are still well two months after completion of therapy One patient with lesions of thirteen years duration refused further therapy after having received 8 5 Gm in fifty-one hours. Fourteen days later the lesions had almost completely healed except for several small crusted areas We have been unable to follow him further The fifth patient with very extensive lesions and pulmonary tuberculosis received 1 Gm daily for ten days The granulomatous lesions improved considerably and healing still continues

Infectious Eczematoid Dermatitis.—Calloway reported a patient with eczematoid dermatitis of the external auditory canal due to Pseudomonas aeruginosa (previously known as Bacillus pyocyaneus) who had received all forms of therapy for over a year with no improvement.[16] The lesions responded favorably in several days after instillations and sponging with a solution of streptomycin (2 500 units per cc) Repeated cultures became negative with complete healing in ten days

Sutton has treated similar infectious dermatitis of the ear (due to P aeruginosa) with good results.[17] He uses 10 000 units per cc of an aqueous solution

Sulzberger and Baer in discussing Calloway's report state that they also have obtained 'very satisfactory' results with topical application of streptomycin in P aeruginosa infections in this location.[18] They incidentally noted that pathogenic fungi were rarely found in the cases of otitis

externa so prevalent among servicemen in the South Pacific, but that P aeruginosa was present in a substantial proportion "

Leprosy—Faget and Erickson report on ten patients who received a four-month course of streptomycin, 2 Gm daily [19] Beneficial effects could not be demonstrated conclusively, but encouraging changes seem to have occurred in some patients The writers were of the opinion that, unless toxicity is reduced, streptomycin will not become the treatment of choice Five patients treated with sulfones and streptomycin responded better than those treated with streptomycin alone

Dreisbach at the Fifth International Congress of Leprosy recommended the use of streptomycin in the acute lepra reaction [20] Carpenter and his group at the same Congress reported on the use of streptomycin in murine leprosy [21] This closely resembles human infection They found that it suppressed the lesions in advanced murine leprosy and lengthened the average survival time by one and four-tenths months

Lymphogranuloma Venereum—We have treated one man with inguinal lymphadenopathy including matted nodes along the iliac vessels He received 2 Gm daily for seven days, at which time therapy was discontinued because of a marked febrile reaction and intensely pruritic rash He showed no improvement but responded subsequently to sulfadiazine

Perifolliculitis Capitis Abscedens et Suffodiens—We have treated two cases Both, on bacteriologic study, showed a predominance of hemolytic and nonhemolytic Staphylococcus aureus which proved penicillin-resistant and streptomycin-sensitive The first patient received 2 Gm daily for twenty-eight days, but new lesions continued to appear during and after completion of the course The second patient received 2 Gm daily for twenty-four days, combined with sulfadiazine and surgery (exteriorization of cystic lesions and establishing drainage) He showed definite improvement The scalp is now well healed but occasionally shows pustule formation

Rhinoscleroma—McHugh has reported temporary improvement in a case of rhinoscleroma treated with 15 Gm of streptomycin [22] Cultures became sterile but within three weeks were positive again

Syphilis—Fisken and Gruhzit have treated experimental syphilis in rabbits [23] They find that the virulence of Treponema pallidum is not affected by streptomycin

Kolmer's group doing similar research found some improvement followed by relapse in three out of six infected rabbits [24] Clinical reports are sparse, but, in general, indicate streptomycin is of no special value in any stage of human syphilis

Cutaneous Tuberculosis—Most studies have been on draining tuberculous sinuses, and only a few reports are available in other types of tuberculodermas We will consolidate all cases from the literature under each form of cutaneous tuberculosis

1 Tuberculosis colliquativa—O'Leary presented five cases of scrofuloderma with treatment varying from 21 5 Gm in five weeks to 85 5 Gm in eighty-one days [25] He found that ulcerations and sinuses responded well and that larger doses (2 Gm daily) with a longer course were more valuable He feels that of the various conditions treated ulcerations and sinuses responded most satisfactorily

In the Veterans Administration, Army and Navy, reports to the Council on Pharmacy, 90 patients with draining cutaneous sinuses and lymphadenitis were reviewed [6] The dosage at first was 1 8 Gm , then 2 Gm daily for one hundred twenty days It was found that 80 per cent of the sinuses healed within ninety days and that healing was accelerated if underlying suppurating foci were evacuated The consensus is that the effect of streptomycin on tuberculous sinuses is strikingly favorable and sufficiently uniform to establish its usefulness Its effect on nondraining nodes was variable In some instances a definite and prompt reduction in size was visible, in others there was little or no change

We have treated two cases of scrofuloderma The first patient was given 2 Gm daily for one hundred ten days He showed healing of the cervical sinuses and reduction in size of the glands Many tuberculous gummas on his trunk also responded favorably, and no new lesions developed The second patient received 2 Gm daily for fifty-five days He was a diabetic with a complicating acne conglobata There was a suppurating tuberculous adenitis Healing of the tuberculous lesion followed promptly but not of the acne conglobata Five cases of cervical lymphadenitis without sinuses responded well under the same regimen of 2 Gm daily, the nodes becoming small and hard with disappearance of inflammatory reaction, although they are still palpable

The annual report of the Committee on Therapy of the American Medical Association recommends streptomycin for draining tuberculous sinuses and considers it highly effective in a large majority of cases [26] The dosage suggested is 1 to 2 Gm daily in divided doses every four to six hours for three to four months However, its values in other types of cutaneous tuberculosis and tuberculous lymphadenitis without sinus formation is yet to be determined

2 Lupus vulgaris—O'Leary reported two

cases.[25] One patient received 115 Gm. of streptomycin in one hundred seventeen days, with healing of the ulcerative process and considerable involution of the infiltration. However, subsequent biopsy revealed typical tubercle formation and latent activity. The second patient received 18 Gm. in twenty-four days with no change. This was considered inadequate therapy. O'Leary concluded that early primary infections such as the inoculation type of tuberculosis probably respond better than long-standing, organized processes.

3. Tuberculosis verrucosa cutis.—We have treated one case with 1 Gm. daily for six weeks. The lesions healed completely with no evidence of relapse after two months.

4. Tuberculosis miliaris disseminata faciei.—O'Leary treated one patient with three courses of streptomycin in six months, totaling 100 Gm.[25] There was no significant lasting improvement, but there were temporary remissions after each course.

We have treated one patient with 2 Gm. daily for a month. There was only slight temporary improvement.

5. Tuberculosis orificialis.—We have treated one patient with 1 Gm. daily for a month. There was good response with rapid complete healing of *the ulcer, which was located on the tongue*.

O'Leary believes that streptomycin should be fortified with calciferol in the treatment of lupus vulgaris and other forms of cutaneous tuberculosis and tuberculids.[27]

Tularemia.—The effectiveness of streptomycin in this condition was recognized early. In 1946 the National Research Council reported on 67 cases with 63 recoveries.[4,5] The average dose was 1 Gm. daily for seven days. Subsequently, the Council on Pharmacy reported that "Pasteurella tularensis is highly susceptible to streptomycin, and this agent is the most effective treatment for tularemia available at present."[28]

Pulaski and Amspacher described ten cases treated in the U.S. Army hospitals with good results.[29] Doses were 2 Gm. daily from seven to fourteen days. Johnson's group treated five patients who responded favorably to an average of 4.4 Gm. administered over seven days.[30]

Benson and Harwell report on 56 patients treated in 22 Veterans Administration hospitals.[31] Dosages varied considerably but averaged about 8 gm. in nine days. If streptomycin was started after the twelfth day of illness there was little effect on the suppurative lymphadenopathy even though striking improvement was visible in other manifestations.

Toxicity

The report prepared by the Veterans Administration, Army and Navy, the Report of the Committee on Therapy, and the article by Farrington and his associates summarize fairly well our knowledge of the toxicity of streptomycin.[6,25,32] For our purpose we will divide these toxic reactions into systemic and cutaneous.

Systemic.

1. Histamine-like reaction.—This is no longer detectable in the currently available purified product.

2. Local irritation at the site of injection.—Also disappearing with purified preparations.

3. Renal irritation.—Casts and albumin are seen often. However serious renal damage is rarely observed unless there is pre-existing renal disease.

4. Blood dyscrasias.—These are rare but mild leukopenia and agranulocytosis have been reported. Recently, two cases of aplastic anemia occurred at the Fitzsimmons General Hospital. All blood dyscrasias have appeared only after many weeks of therapy.

5. Eosinophilia.—In the majority of patients, at some time during the course of therapy eosinophilia varying from 5 to 30 per cent has been observed.

6. Vertigo.—Vestibular dysfunction has been reported about the fourth week of continuous *therapy. However, there is usually complete* symptomatic recovery by compensatory mechanisms and not by restoration of labyrinthine function.

7. Deafness.—This will be produced rarely and only following large doses or when streptomycin excretion is defective. Useful hearing is usually regained if treatment is suspended promptly.

Cutaneous

1. Eruptions following injections.—There may be a pruritic *erythematous, maculopapular* eruption having its onset within the first ten days of therapy. The pruritus is usually relieved by antihistaminics; the eruption itself disappearing in three to seven days. Therapy does not have to be interrupted. It is sometimes accompanied by fever. Steiner and Fishburn report a 20 per cent incidence in 33 cases.[33]

The Veterans Administration, Army and Navy report seven cases of exfoliative dermatitis (0.80 per cent) in which streptomycin had to be discontinued.[6]

In our cases the early rash was maculopapular morbilliform, scarlatiniform and frequently non pruritic. Our incidence has been 16.6 per cent (five out of 30 who had received a course of one hundred twenty days therapy). This rash did not seem to be related to exfoliative dermatitis which we have seen in two patients. In both of these it appeared after two months of therapy

which had to be stopped on the sixty-seventh and seventy-sixth days, respectively One had also presented an early rash which had disappeared spontaneously, while the second had had no early rash This early rash and the exfoliative dermatitis seem to have the same relationship as the ninth day erythema of Milian and the exfoliative dermatitis seen following arsenical therapy

2 Dermatitis Venenata —This has been observed among personnel handling the drug It has been reported by Strauss and Warring, Rauchweiger *et al*, and ourselves [34-36] We have now seen seven nurses with this type of dermatitis Its location is usually on the hands and around the eyes It has appeared only in those who are in daily contact with the drug over a protracted period It appeared in one nurse after two months of service on streptomycin wards It has not been observed among nurses working on wards where streptomycin is used only occasionally One nurse has had to transfer to a section where no streptomycin is used because of extreme sensitivity to the mere presence of the drug in the room Desensitization of this case was unsuccessful Another has shown "hardening," the eruption appearing after prolonged vacation on several occasions and disappearing after several weeks work with the drug The other nurses have been able to protect themselves by working with gloves This has become a sufficient problem so that we now advise all personnel who handle streptomycin routinely to wear gloves

We are now pursuing further studies with prophetic patch tests and direct application of a carbowax ointment in an attempt to determine the sensitizing index of streptomycin used therapeutically as an ointment

Summary and Conclusions

1 Streptomycin is the antibiotic of choice in granuloma inguinale, tularemia, and cutaneous infections due to Pseudomonas aeruginosa (B pyocyaneus)

2 It is of definite value in tuberculosis colliquativa, tuberculosis orificialis, chancroid, gonorrheal infections, infectious eczematoid dermatitis, and in cutaneous infections where other antibiotics have failed or where the patient presents an idiosyncrasy

3 It may benefit other forms of cutaneous tuberculosis, rhinoscleroma, and leprosy Further clinical investigation in these diseases is recommended

4 Systemic toxic reactions are not rare and may be serious but usually appear after weeks of therapy Vertigo due to labyrinthine disturbances is not uncommon and may be annoying and permanent

5 Cutaneous reactions are of three types (*a*) An early polymorphous biotropic type of exanthema appearing before the tenth day which responds to antihistaminics and does not require cessation of therapy, (*b*) an exfoliative dermatitis, appearing after many weeks of therapy necessitating cessation of therapy, and (*c*) a troublesome contact dermatitis of high incidence, especially in nurses continually in contact with the drug over long periods which necessitates either the wearing of rubber gloves, frequent rotation of nurses, or removal from further contact

TEETH AND SKIN DISEASES

G C Andrews, M D , A N Domonkos M D , and M E Hopper B A New York City

(From the Department of Dermatology Presbyterian Hospital, College of Physicians and Surgeons)

FROM infancy to old age the teeth have a role in skin diseases. Even the edentulous old man with full upper and lower plates may have eczema from a retained root fragment about which there is infection or from pressure necrosis of the gingivo-buccal mucosa from the dentures

These troubles may be chronologically listed as follows

1 Infantile eczema produced or exaggerated by deciduous teeth

2 Alopecia areata in children, five years of age and up, from teething and impactions

3 Pustular rosacea, sycosis vulgaris, pustular bacterid, eczema, dental fistula, or recurrent furunculosis from abscessed teeth, mostly in middle-aged people

4 Eczema of the legs, spreading to other parts of the body, from abscessed teeth in elderly people.

5 Miscellaneous dermatoses, such as chronic urticaria, lupus erythematosus, erythema multiforme, erythema nodosum, purpura, pemphigus etc., in which focal infection may be a factor

Statistics

Charts of 15,225 patients in our private practice were examined Of these, there were 286 cases of skin diseases, exclusive of alopecia areata, probably due to focal infections of the teeth, tonsils, or sinuses. Of these, 78 cases were selected for the basis of this paper Only two cases have been reported previously [1] This selection was made on completeness of data and thoroughness of study Forty five cases were cured permanently and completely by the removal of foci of infection This is 58 per cent that are known to be cured Many others probably were cured but want of a definite statement to that effect excluded them Of the 45 cases known to be cured there were 22 pustular bacterids, of which 12 were due to infected tonsils, nine to abscessed teeth and one was caused by a rectal fistula. There were 17 cases of eczema of the legs, all caused by abscessed teeth There were three cases of pustular rosacea, two of which were cured by removal of teeth and one by tonsillectomy There were two cases of chronic urticaria, both cured by extraction of abscessed teeth, and one case of eczema of the face, cured by removal of teeth.

Other cases not included in the cured list are three of pustular bacterid and one of chronic urticaria in persons with polypoid pansinusitis, and one case of pustular bacterid in an elderly woman who had diseased tonsils, a white blood count of 12,500, and pathogens on tonsil cultures, and whose eruption cleared repeatedly after she was given sulfadiazine by mouth We also did not include patients who answered the questionnaire indefinitely with, "Since having my tonsils removed one year ago, the skin condition on my fingers has improved 50 to 75 per cent though not completely cured "

Infantile Eczema

Although intensive studies have elucidated some problems of this disease, our knowledge is still fragmentary Each case is a separate problem and too often a baffling one However most doctors who have had experience in infantile eczema agree that teething may exaggerate the eczema and that there are cases of eczema that occur in children eighteen to thirty months of age which only disappear after dentition is over Holt and McIntosh state, "In cases of eczema the symptoms often undergo a distinct exacerbation with the eruption of each group of teeth "[1]

Rosacea

Feit, Laslo, and Vero in 1935 first interpreted rosacea as a bacterid from focal infection [2] A clinical experience started their study It is worthwhile to give their description ' A woman with a pustular eruption of the face of several years' duration consulted us The eruption resembled iodide acne " There was no improvement from local treatment, but she returned a few months later completely cured, attributing her cure to the draining of a maxillary empyema caused by an infected tooth The recovery of this patient was so dramatic that the doctors decided to study the question of focal infection in rosacea In a series of 50 patients with rosacea they found definite focal infections in 43 cases and of these 78 per cent were either completely cured or improved by removal of the foci [2]

We have had several cases of this type and the following is an example

Case 1 —L B a man aged 71 consulted us in October, 1941 because of pustular rosacea of the nose and cheeks of five years duration He had been treated previously with sulfonamide ointment which helped temporarily His teeth had not been checked in many years Examination revealed that

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Dermatology and Syphilology May 21 1918.

he only had a few remaining teeth, which looked carious There was gingivitis Radiographs of the teeth showed four root abscesses All the remaining teeth were extracted on December 3 Three weeks later the skin eruption was entirely gone, and it has never recurred

Pustular Bacterids

Pustular bacterids of the hands and feet are chronic recalcitrant vesicular and pustular eruptions, symmetrically located on palms and soles, which during quiescent periods become dry, erythematous, exfoliative patches The course is characterized by repeated exacerbations, during which groups of vesicles of pustules break out over the involved areas with severe itching and sometimes swelling and pain From day to day, fresh groups of lesions may appear, and in some cases vesiculation is pronounced, whereas in others the lesions are almost entirely pustular from the onset In still others, the early vesicles become pustules in the course of time Gradually the number of new lesions diminishes and the condition temporarily subsides to a quiescent stage, in which the involved areas are diffusely erythematous, dry, shiny, and exfoliative

The condition has a direct relationship to focal infections Cures result when the focal infection is identified and removed In many cases in which cures have been achieved, the tonsils were diseased and tonsillectomy was followed within a few months by a complete cure In other cases, abscessed teeth, cholecystitis, chronic pyelitis, and other sources of infection were the cause of the trouble

A leukocytosis is present in many cases Frequently the counts are 10,000 or more, and occasionally they are much higher In two cases the leukocyte counts were over 19,000, and in several instances have been as high as 14,000 and 16,000 This does not mean that a leukocytosis is present in all cases at all times Apparently it develops at the time of an exacerbation

Cultures of material from the lesions are often sterile

Positive cutaneous reactions are obtained to staphylococcus and streptococcus extracts It is difficult to estimate whether or not this is important, but perhaps it has slight significance We are not impressed by the reliability of such tests

The histologic picture shows pustules deep in the epidermis, with hardly any inflammatory reaction about them and without much acanthosis and parakeratosis The microscopic changes resemble those seen in some cases of trichophytids

Barber has acknowledged the term "pustular bacterid" presenting cases of this condition, and has sent us excellent photographs of cases in which he has made the diagnosis of pustular bacterid He believes pustular bacterid is more vesicular and more eczematoid than pustular psoriasis,[2] from which he can differentiate it Certainly the typical case of pustular bacterid has no semblance to psoriasis vulgaris, clinically or histologically

The occurrence of similar eruptions in patients who have psoriasis is debatable The histologic changes in such cases have been interpreted variously In 1936 MacKee and Foster, with the assistance of Satenstein and Fraser, showed that the histologic changes of aberrant lesions in a group of 20 cases of so-called pustular psoriasis of the extremities were eczematous [3] Satenstein held the view that pustular psoriasis was a misnomer and that the histologic picture in these cases was one of chronic eczema and not psoriasis In 1945 Sachs and Scannone showed that the majority of cases of so-called pustular psoriasis were not related to psoriasis [4] They found no relationship between the Munro abscess of psoriasis and the pustule of the so-called pustular psoriasis Nor did they consider the latter to be an exaggeration of the former

In 1947 Sachs, MacKee, and Rothstein reported 11 additional cases of so-called pustular psoriasis [5] They found no evidence of psoriasis, either clinically or microscopically, in any of these cases, and only one had a family history of psoriasis Their histologic findings were exactly the same as those of Machacek in the series of 15 cases, of recalcitrant eruptions of the palms and soles, reported by Andrews, Birkman, and Kelly in 1934 [6,7]

Those cases were later designated as pustular bacterids by Andrews and Machacek, who stated, "The abscesses are deeply situated in the epidermis and are not superficial like Munro abscesses The presence and even decreased thickness of the granular layer in most of our cases and the very slight and inconstant parakeratosis were not in accordance with psoriasis The paucity or complete absence of inflammatory changes outside the pustules were against psoriasis The amount of acanthosis, parakeratosis, and elongation of the papillae in the biopsy specimens from our patients was no more than observed in other diseases, such as eczema, dyshidrosis, and palmar trichophytosis In other words, the histologic changes are far from being pathonomonic for psoriasis and are in general not like those of psoriasis "[6]

That a large portion of these cases are associated with focal infections and are cured by the removal of these infections has been demonstrated over and over again for many years The term, pustular bacterids, first used in 1935, has withstood the test of time and is applied more and

more to such eruptions, as the cause is more carefully studied in tonsil cultures and aspirations, full dental radiographs and vitality tests, trial doses of sulfonamides or injections of penicillin, sensitivity to autogenous vaccines or staphylococcus or streptococcus toxoid, and in oft-repeated white blood cell and differential counts

Case Reports

Case 2—G L, a man aged 50, from Quebec consulted us in April 1947 because of an eruption that had begun the preceding November It started on the soles and heels then spread to the palms He had been treated for dermatophytosis by several dermatologists, but no microscopic examinations had ever been made The patches were vesicopustular and rather symmetrical. We could not find any fungi He had several dead teeth and one broken tooth. The white blood cell count showed 18 000 cells. The differential count was polymorphonuclears 82 per cent (mature 77 per cent, immature 5 per cent) lymphocytes 15 per cent eosinophils 1 per cent, monocytes 2 per cent An injection of 200,000 units of penicillin intramuscularly caused improvement overnight We later received a letter from the patient saying that the eruption had cleared completely a month after the removal of his teeth

Case 3—I T a woman aged 21 consulted us in September 1947 because of an eruption which began on the palms after the birth of a baby nine months previously There was no history of psoriasis in the patient or her family On both palms especially over the thenar and hypothenar eminences, there was an erythematous pustular exfoliative eruption (Fig 1) The pustules were mostly at the edges of the scaly patches although some were distributed in the patches Some pustules had dried leaving brownish spots The fingernails were eroded and broken off and some were very loose (Fig 2) On the heels there were patches of scaly vesicopustular character Also on the lateral aspect of the left forefoot and little toe was a similar scaly pustular patch. Direct examinations for fungi from the palms, nails and soles were negative Cultures were made for fungi

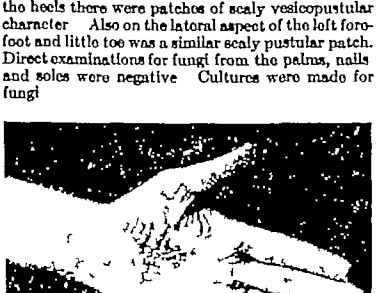

FIG 1 Pustular bacterid. The patient had pustulo-follicular exfoliated patches, of nine months duration on both palms. The eruption cleared up after a tonsillectomy (Case 3)

FIG 2 Distrophic nail changes with no fungi present The nails also became normal after tonsillectomy (Case 3)

The teeth appeared in good condition and her dentist verified this fact The tonsils were very large red and almost met in the midline the tonsillar crypts were filled with pus. The white blood count was 12 500 The tonsils were removed and Dr Peter S Lerner wrote to us in November, 1947,

Under separate cover I am mailing you the pictures of Mrs T's hands I am told that they have improved remarkably since tonsillectomy "[6] Later he reported by telephone that the hands were entirely well, and recent inquiry shows that they have remained cured.

Case 4—L W, a woman aged 39 consulted us in March 1946 with a pustular eruption of two weeks' duration. The patient was scarcely able to walk because of profuse aggregations of small pustules and pustulovesicles on both soles. She had a low-grade fever, and her leukocyte count was 18,000 Examination for fungi was negative Blood sugar was 115 mg per 100 cc. Penicillin was administered without improvement. Roentgenograms of the teeth showed three that might have been infected, but there was not enough evidence of focal infection to warrant extraction

There was a history of severe sinusitis ten years previously The patient also had had seasonal hay fever due to ragweed She had shown intolerance to sulfonamides

The tonsils were small deeply imbedded with marked adhesions of both capsules. The tonsils were aspirated on May 29 and a considerable amount of pus was obtained from them. The condition of the hands and feet improved the following day On June 1 the tonsils were removed surgically Soon afterwards there was marked improvement of the skin condition which by fall had entirely healed and has remained so without any other treatment

Case 5—W F D a woman aged 33 refused to have her tonsils removed but later developed acute otitis media. After recovery her physician insisted that the tonsils be removed A tonsillectomy was performed in 1930 The pustular eruption on the heels and palms which had been present for three and a half years and had resisted all treatment disappeared within two months after the tonsillectomy and has never recurred.

Eczema

In addition to the pustulovesicular eruptions characteristic of pustular bacterid, we have encountered a large number of vesicular and eczematoid patchy eruptions on the fingers, toes, heels, and dorsal aspects of the hands, as well as on the palms and soles, which belong in the same category Occasionally such eruptions are rather diffuse and exudative, so that they are mistaken for contact dermatitis They may be predominantly exfoliative and vesicular, with alternate periods of quiescence and activity These may have the appearance of fungus infections and be treated as such for years

There is also a distinct entity which we call dental eczema (Fig 3) It occurs on the legs of older people and is due to abscessed teeth Most of the patients are men Such cases usually begin as vesicular or crusted pruritic patches on one or both legs just above the ankle, or on the sides of the ankle or foot The eruption spreads next to the dorsa of the hands or forearms, and then may affect the ear or become widespread The affected skin is invariably excoriated and erythematous, sometimes exudative, like contact dermatitis, and at other times lichenified and crusted The leukocyte count may or may not be elevated, ranging from normal to 20,000 This type of eczema due to bacterial sensitization is so common in middle-aged and older people, who usually have no history of previous skin trouble or of any allergic condition, that the syndrome is an entity Over and over again this suspicion is verified by the dentist, and the skin condition is cured by extraction

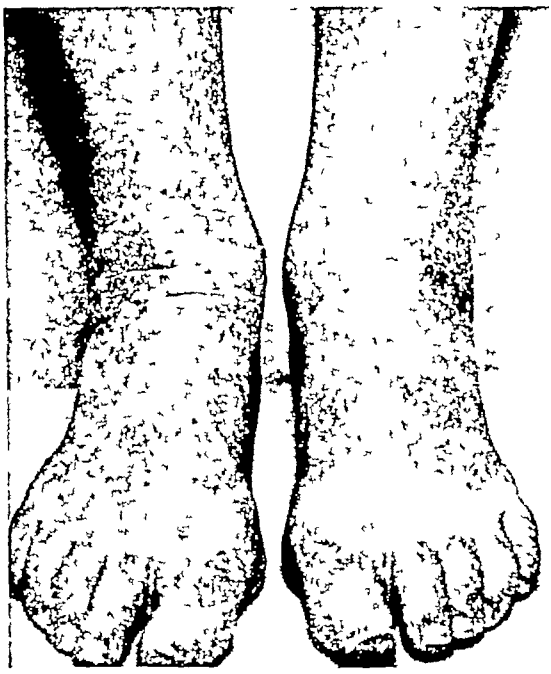

Fig 3 Dental eczema of ten years' duration The upper teeth of the patient had been injured by football playing, so that he had four nonvital abscessed teeth, bad bone absorption, and decay All the infected upper teeth were extracted, and the eczema cleared

Case 6 —W A D , a man aged 72, was first seen at the New York Hospital in 1945 He had a widespread erythematous, eczematous eruption, with the legs especially edematous The history showed that ten years previously 17 abscessed teeth had been removed The remaining teeth were apparently diseased His dentist, when questioned, said the patient had several dead and infected teeth for which he had advised extraction Four months later, in February, 1946, the remaining abscessed teeth were extracted There was immediate improvement in the skin condition, and by April the skin was entirely normal He has remained free from eczema ever since and at the age of 75 designed the famous balcony for the White House in Washington, D C

Miscellaneous Dermatoses

Sycosis vulgaris is often secondary to a focus of infection in the paranasal sinuses or in the teeth or tonsils Abscessed teeth may cause chronic urticaria, or cheilitis, or influence the course of lupus erythematosus, erythema multiforme, erythema nodosum, pemphigus, and other skin diseases

Alopecia Areata

Nineteen centuries ago Celsus described alopecia areata From that time until the present day this disease has been ascribed to many different causes

The first clinical work reported was that of Bateman in 1829 [15] The rapid strides in medicine during the latter half of the nineteenth century, following the new vistas opened by Pasteur, brought about the theory of a parasite as the causative agent In 1887 a commission appointed by the Paris Academy of Medicine announced that alopecia areata was contagious, however, the causative parasite could not be found After years of work Sabouraud announced in 1900 that the parasitic theory was the only acceptable cause [16]

During the latter half of the nineteenth century another theory was proposed by Barensprung, who believed that alopecia areata was a neurotrophic disorder [17] This belief was further stimulated by the experiments of Joseph, in 1886, who sectioned the posterior root of the second cervical nerve distally to the ganglion in cats and dogs [18] This produced a lesion similar to that of alopecia areata in man

The twentieth century ushered in a new etiologic theory known as the dystrophic theory of Jacquet [10] Later the endocrine theory gained favor among the many students of this subject

These four theories—the parasitic, neurotrophic, dystrophic, and the endocrinic—have had their faithful adherents The parasitic theory was finally and definitely rescinded by Sabouraud himself in 1913 The neurotrophic theory, affirmed by Joseph in 1886 has been entirely discredited in recent times by the work of Wright (1920), who showed that cutting the posterior root of the second cervical nerve in man, cutting the sensory nerves which supply the scalp, and cutting the entire supply of the sympathetic nervous system to the scalp are without influence on the hair [11] Subsequently, Auburn in 1932 in a series of 118 operations on the cervical nerves, also disproved this theory [12]

The endocrine theory, with the influence of the glands on the nervous system both in the mental and physical sphere has been a major factor in explaining the cause of alopecia areata Disturbances in the functions of the thyroid, pituitary, and sex glands are most frequently mentioned However, Waisman and Kepler, at the Mayo Clinic, in a study of 138 cases of alopecia areata concluded that there was no gross clinical evidence consistent with functional abnormality of internal secretions.[13]

The dystrophic theory of Jacquet concerned itself mainly with the teeth. He maintained that *alopecia areata was not an entity but a symptom* of diverse and banal conditions He attempted to show that dental pathology was possibly the most important factor in causing reflex irritations and producing alopecia areata. Gingivitis, periodontal inflammation, pyorrhea abscessed teeth, abnormal evolution of teeth, and impactions were included in his definition of dental pathology [10]

An interesting finding was the fact that usually the pathology of the teeth was ipsilateral with the alopecia areata His studies in the localization of alopecia areata led him to believe that there were predisposed zones (peladophores) of the scalp and beard where alopecia areata was most frequent as a result of reflex irritation The most frequent sites of expression were the mastoid, lateral mental, and the nuchal regions The frequency of these regions, according to Jacquet, corresponded to the most highly innervated regions of the integument of the scalp [12]

Jacquet lived before the days of dental radiographs and anesthesia At that period it was difficult to tell whether a tooth was impacted or infected except by probing or by extracting it. Sometimes a rather crude and vigorous approach was employed in order to prove Jacquet's hypothesis With the exception of a report in 1942 by Grace, attributing one case of extensive alopecia caused by teeth, the medical literature has been devoid in recent times of further investigations of Jacquet's theory, despite the obvious advantages afforded by modern-day dental x ray technic [14]

It is for this reason that we have assembled from private practice 58 cases of alopecia areata in which dental pathology was noted Satisfactory full mouth x rays were obtained in 24 of the 58 cases Of these 22 (90 per cent) had definite dental pathology, 13 of the 22 (53 per cent) had impactions On visual examination where x rays were not obtainable, there were 25 cases (74 per cent) of the 34 with definite pathology of the teeth, eight of the 25 (32 per cent) had impactions Impactions, root fragments abscessed teeth, severe alveolar retraction and multiple devitalized teeth with caries were considered as pathologic conditions Simple caries were not considered These must be explained by the theory of reflex nerve irritation This is one of the vague physiologic theories which no one can completely prove or disprove We can only offer our material and let you judge for yourselves

Case Report

Case 7—S G a woman aged 17 in January, 1946 had a small area of alopecia develop on the occipital area of the scalp When she was first seen by us in March, 1948, defluvium had progressed to an extensive irregular area covering the entire back of the scalp, measuring 15 by 15 cm., and to an irregularly band-spaced patch on the left frontal and parietal region measuring 5 by 12 cm She had a minimal amount of hair on the rest of her body, none on her arms and legs and sparsity in the pubic and axillary areas. Previous treatment had consisted of 100 000 units of vitamin A daily, estrogenic therapy thyroid extract, intramuscular crude liver extract, and applications of local ultraviolet light and phenol

At the age of eight she had chorea, from which she recovered with no residual defects She had no other pertinent medical history

Physical examination showed no abnormalities. Her tonsils were out and the teeth were in an excellent state of repair however only one wisdom tooth was erupted, which was not unusual at her age Nevertheless a full mouth x ray was advised Herewith is the report of a competent dentist All teeth are vital and free from apical infection She does have, however three unerupted third molars It seems that it would be very difficult for these teeth to erupt in their proper position as there is not room enough in the lower jaw for the right lower third molar to come through completely and the upper two teeth seem to be caught under the bulge of the second molars. The tissues around the crowns of these teeth always contain a low-grade chronic infection and I believe it would be wise to remove them

Accordingly the three impacted teeth were extracted March 10 1948. Six weeks later hair was growing and eight weeks later all the patches were being rapidly filled in with new hair

Case 8—A. S. a man aged 31, in September 1947, had a bald oval-shaped area of alopecia, 3 cm in its

greatest diameter, developed on the lower right buccal area. General examination showed no gross abnormalities The teeth were in good repair, however, the lower right bicuspids were crossed, with the second bicuspid displaced lingually and anteriorly X-rays confirmed the findings and showed incomplete filling of the two crossed teeth and decay of the lower right molars

Local treatment of phenol and alcohol was performed until January, when extraction of the questionable teeth was started Five weeks after complete extraction of the teeth, there was a complete regrowth of hair in the previous bald patch.

Case 9—D L, a woman aged 21, in June, 1947, developed alopecia on the back of her scalp, about 10 cm in diameter

Tonsils had been removed in childhood Examination of teeth, confirmed by full-mouth x-ray, showed four impacted wisdom teeth which were infected Previous treatment consisted of vitamin A, 50,000 units daily, and ultraviolet light locally In October, 1947, the four impacted wisdom teeth were extracted Three weeks later hair was regrowing in the patch Healthy, normal hair completely regrew, and there has been no recurrence of the alopecia

Summary

A study of the relationship of infected and impacted teeth and infected tonsils to various skin diseases has been made It has been proved justifiably that pustular bacterids of the palms and soles are cured by removal of such foci of infection It has been shown that eczema of the legs in old people is frequently caused by abscessed teeth. The possible connection of dental pathology, especially impaction, with concomitant infection to alopecia areata has been discussed

Discussion

Dr Leslie Paxton Barker, *New York City*—For many years I have been interested in the relationship of foci of infections to cutaneous eruptions These are at times primary, but, more frequently, they are secondary or contributory causes of cutaneous eruptions A commonly overlooked focus of infection is the prostate gland I have seen many recurrent attacks of furunculosis stopped by massage of the prostate gland which relieves pyogenic infection

Also, I have seen many cases of so-called hemostatic dermatitis, in old people with badly infected teeth, improve only after the infected teeth have been removed

Lupus erythematosis does not respond well to treatment in presence of infection While I do not believe foci of infection are the primary causes of lupus erythematosis, they certainly interfere with response to treatment We have all seen cases of chronic urticaria, pustular bacterides, and alopecia areata clear up completely after the removal of the infection The most common of these are the teeth, tonsils, sinuses, prostate gland, and intestinal tract

The relationship of foci of infection and cutaneous eruption further emphasizes the fact that cutaneous disorders are often merely symptoms of internal disorders

Dr Tibor Cholnoky, *New York City*—If focal infection is detected in the mouth, it cannot always be eliminated by simple extraction of the offending teeth, as the infected focus may persist in the jaw as peridental infection If, after extraction of the teeth, improvement does not occur or is only transitory, the patient may be harboring an infection in the alveolar process "Irritation" from the denture, and tenderness or pain of the gum suggest persistent focal infection

X-ray examination may be helpful but is frequently "negative" There may be increased leukocyte count or sedimentation rate, but the cardinal sign is local tenderness Chemotherapy does not seem to improve this condition because of the probable venous stasis The proper treatment of such areas is partial, or, if necessary, total alveolectomy, followed by careful after-treatment as advocated by Siegmund, Fischer, Murray, and Yoder *

Dr Eugene F Traub, *New York City*—It was a privilege to be asked to discuss the paper on focal infection and skin disease by Doctors Andrews and Domonkos, and Miss Hopper They have presented us with an interesting paper on a subject of great practical importance to the patient I am in full accord with the presenter's general viewpoint, except that I believe we have to be somewhat cautious on stating that "cure resulted on removal of the focus" While this is exactly what does happen quite frequently, nevertheless does this indicate definitely that the focus was the cause of the eruption? I believe that it does not indicate causal relationship and should be put down rather as a contributing or background factor It represents a load which the patient is unable to carry and thus throws off through skin eruption When the load is removed, he is able to handle the skin eruption and hence it disappears with minor local treatment

The second point that I would like to bring up is a matter of cross infections An original focus may reside in the teeth, and, after a time, this gives rise to infection in the gastrointestinal tract, the gallbladder, prostate, or other parts of the body Frequently it is necessary not only to remove the seat of the primary infection but the secondary foci as well, and in some instances, when this is not entirely possible, a vaccine made from the organisms of the infection is helpful

Probably we all agree that in the disease called pustular bacterid, foci of infection seem to play a predominantly causative role We have all had too many startling and striking examples of this to admit further doubt On the other hand, there are a number of cases in which the diagnosis apparently was established beyond reasonable doubt in which the removal of infected teeth, tonsils, massage of pros-

Fischer M Death and Dentistry Charles C Thomas Springfield Illinois (1940)
Yoder H. P A Dental Digest (Feb) 1946

tate, and the removal of all other foci still failed to clear up the eruption

I have in mind one particular case that I have followed for a number of years. A man aged 50, G. R., who had a severe, widespread eruption of several years' duration involving the palms and soles. In fact, the eruption was so severe that it was practically impossible for the individual to work. All his teeth were either removed or thoroughly checked and improved. As the eruption did not clear up entirely, however the tonsils were removed with further improvement, and at one time it seemed as though the eruption was about to disappear entirely. However, gradually the lesions returned and further foci were sought. As the prostate was boggy it was massaged and again flare-ups and improvement occurred. No other foci could be found following hospital study, although this of course does not absolutely exclude the possibility. The patient still has an extensive eruption which is only controlled slightly by local treatment. I might say this patient also improved under injections of tartar emetic, local applications of tar and ultraviolet light, etc. but complete recovery has not occurred.

In another case, that of a younger woman the only one I have seen who stated that her hand eruption as well as that on her feet, occurred following an attack of tonsillitis. The eruption was persistent but improved over a period of years. It flared up again however, whenever she had tonsillitis. The eruption fitted into the typical picture of a pustular bacterid, and in this case the removal of her tonsils resulted in a complete cure. In my experience this case was unique in that the skin symptoms definitely followed obvious attacks of tonsillitis.

I would also agree that in infantile eczema teething is undoubtedly a factor. Whether it could be listed as a causative factor however, is open to question. My feeling is that the teeth in such instances—and this is true also in many cases of focal infection—are merely a *contributing factor and not the true* cause of the skin disease.

Rosacea also is a disease in which foci are to be sought. That foci are the sole cause in most cases I doubt very much however anyone carrying a definite focus certainly stands a much better chance of cure on removal of this handicap.

Doctors Andrews and Domonkos report a distinct entity which they call dental eczema, which occurs particularly on the legs of old people especially in old men and is due to abscessed teeth. Undoubtedly old men are apt to have more foci in teeth than younger individuals and hence a higher percentage of infected teeth will be found in such an age range. I would doubt the existence of any specific entity in which simple removal of foci in teeth would regularly clear up eczema on the extremities. I have seen innumerable such patches of eczema in older men and women. It occurs generally between the period of late fall and early spring rarely carrying over through the summer. A high percentage of these patients fall under the heading of winter eczema or winter dermatitis, and are cured by local medication less frequent use of soap and water and protecting and greasing the skin particularly in the fall before the eruption occurs. Doctors Keim and Guy recently reported that such individuals, in their experience had metabolic disturbances and fared better on a high protein intake, but in each case the diet seemed to be a factor that had to be individualized.* In other words, there is no doubt that these cases are common and that a multiplicity of factors prevail, including focal infections in teeth. I would not ascribe to infections in most of these patients more than a minor contributing role.

It is worthwhile, however, to cite a patient, a man who had an extensive eczematous eruption on both forearms. This individual was 42 years of age and had had the eruption for approximately one year. Local treatment brought about temporary but no permanent relief. Foci of infection were sought and three infected teeth were found. Their removal resulted in no change in the local eruption and further foci were sought. On examination the prostate was found to be infected and the organism found was thought to be of dental origin. Following prostatic massage there was an immediate flare-up of the eruption on the arms. This was followed in several days by a distinct improvement. The same sequence of events followed each one of the six succeeding prostatic massages, and at this time the patient's eruption had entirely cleared up and, to my knowledge, he has had no further trouble. I wish to stress this peculiar combination which I have encountered not once but many times—that is a dental infection in teeth followed by an infection of the prostate. A cure of the patient will not result until both foci have been eradicated.

In the case of alopecia areata I can only emphasize what Doctor Andrews has already stated and cite one important case—that of a young girl, 13 years of age, who presented herself with a typical patch of alopecia areata in the center of the scalp. In searching for a focus of infection, we advised her to consult a nose and throat specialist to have her tonsils and sinuses checked. Unfortunately this physician belittled the idea that a focus of infection could cause her hair loss and gave her a rather superficial examination. The mother, not having been satisfied consulted another otolaryngologist who found the right antrum entirely filled with pus. The surprising feature was the extent of the involvement without any symptoms whatsoever pointing to the antrum. On drainage of this focus, the hair gradually returned.

One might regard this cure as a coincidence had it not been for the fact that this same young lady, at the age of 16 returned again with a fresh patch of alopecia areata. She had had no symptoms referrable to her sinuses, but nevertheless the right antrum was again found to be extensively infected. After the antrum was drained and washed the hair again returned. I believe this case can be put down as one in which the relationship between a focus of infection in the sinus and an alopecia areata can be definitely established.

In chronic urticaria, the gallbladder is frequently

* Keim, H. L., and Guy, W. H.: Arch. Dermat. & Syph. To be published.

the site of infection, but this may be secondary to infections either in the teeth or gastrointestinal tract

The last disease that I wish to mention is lupus erythematosis I do not believe that a patient should ever be treated for this disease without a thorough check for foci of infection, and, I believe, also, that it is particularly important to do cultural studies from the various foci and prepare a vaccine if a pathogen can be more or less uniformly found in the various foci While this does not necessarily cure the patient, I believe that, along with other treatment, it frequently makes a final satisfactory outcome

PROTEIN THERAPY UNSUCCESSFUL FOR PEPTIC ULCER, SAY DOCTORS

Protein hydrolysate, predigested protein, is of little value in treating peptic ulcer, five Cleveland, Ohio, doctors report Writing in the August 7 issue of the *Journal of the American Medical Association*, the doctors—Edward E Woldman, David Fishman, Richard S Knowlton, A Ashley Rousuck, and Willard C Stoner—describe their findings from a study made at the department of gastroenterology, St Luke's Hospital, Cleveland

Protein hydrolysate therapy, also known as amino acid diet because the protein is made up of amino acids, is one of the comparatively new treatments for peptic ulcer and one which has been regarded as extremely promising

Developed by Dr Frank Co Tui of the New York University College of Medicine and the New York University Division of Surgery, Bellevue Hospital, New York City, and his associates, it consists of regular feedings of protein hydrolysate and carbohydrates for a period of two or three weeks Supplementary vitamins are also given Many of Dr Co Tui's patients were relieved of pain within twenty-four hours after the treatment was begun Even in "intractable" cases—those who had not improved on complete bed rest and strict Sippy treatment—the ulcers became inactive The alkaline Sippy powders neutralize excess acidity in the stomach and, combined with a mild, soothing diet, have long been used for treating peptic ulcer

Dr Co Tui's theory was that the high caloric and high protein diet rehabilitated the strength and body weight of the ulcer patient as well as prevented overacidity in the stomach Many peptic ulcer patients, Dr Co Tui found, were deficient in protein

Such protein deficiency is brought about by an unbalanced choice of foods rather than by the ulcer patient's inability to retain or digest proteins in ordinary forms, the Cleveland study indicates None of the 22 peptic ulcer patients treated in the study showed protein deficiency To test the therapy, the doctors administered a continuous drip of 10 per cent protein hydrolysate for fourteen days through a tube inserted into the patient's stomach through the nose

Although protein hydrolysate lowers the free acidity as long as the preparation remains in the stomach, they found that its after-effect is to raise the patient's stomach acidity to a higher level than it was before treatment

"When protein hydrolysate leaves the stomach," they say, "there is apparently a stimulation of the production of more free acid to a higher level than the original state The presence of the amino acids in the upper part of the small intestine apparently causes a hormone to be liberated which stimulates the secretion of hydrochloric acid"

Protein hydrolysate also ceases to counteract stomach acidity after being given in repeated small doses, they explain In most of the 22 patients, free hydrochloric acid was observed in the stomach despite the continuous drip of protein hydrolysate Ulcer pain continued for twenty-four to seventy-two hours, and in some patients the pain recurred later during the treatment A month after treatment was discontinued, eight patients had ulcer symptoms again

CONTACT DERMATITIS FROM BEETLES, WITH A REPORT OF A CASE DUE TO THE CARPET BEETLE (ANTHRENUS SCROPHULARIAE)

FRANK E CORBIN M D and GEORGE M LEWIS M D, New York City

(From the Department of Medicine (Dermatology) Cornell University Medical School and the New York Hospital)

A RECENTLY studied patient was found to have a cutaneous disorder characterized by somewhat unusual clinical features On further investigation, the causative agent was found to be the larval form of the common carpet beetle The dermatosis was peculiar in that the reaction was one of hypersensitivity, moreover, a survey of the literature failed to reveal any recorded examples of a similar nature It would seem desirable, then to summarise briefly the historical data, clinical features, and investigative findings in this unique dermatosis

Case Report

Miss A M a graduate nurse forty-seven years of age was seen because of a bizarre type of dermatitis involving mainly the exposed surfaces of the body She had been in good general health until three weeks previously, at which time papulovesicular lesions appeared on the extensor surfaces of the forearms. During the next few days the eruption appeared over the neck the adjacent surfaces of the chest, and to a lesser degree on the anterior aspects of the legs. The eruption became more closely set, especially on the neck, but also on the forearms When first seen it was characterized not only by papulovesicular lesions but by underlying erythema, punctate crusting, some tendency to the development of edema and urtication of individual lesions The general characteristics of the eruption are shown in Fig 1

The condition was accompanied by a great deal of

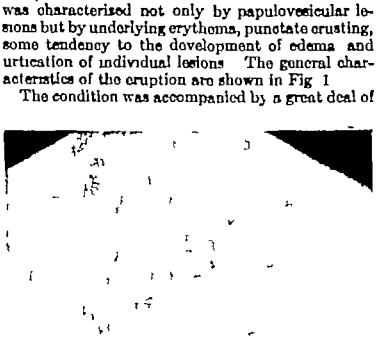

FIG 1 Erythematopapular eruption involving the neck and exposed area of the upper chest.

pruritus which seemed definitely worse when the patient remained for a time in her apartment It was especially severe at night. The eruption was considered initially to be an unusual type of contact dermatitis, and so a complete contact history was taken However, clothing, plant, topical agents, or common airborne contactants could not be identified. The patient then volunteered the information that the entire floor of the apartment house where she lived was infested by an insect. Specimens of the insect were identified by Dr C H Curran entomologist at the American Museum of Natural History in New York, as the larval form of the common carpet beetle Anthrenus scrophulariae L.

Special Studies—Contact studies were done Initially several larvae were ground in a mortar and the resultant mass extracted with normal saline to which a small amount of phenol was added as a preservative Patch tests with this material read after forty-eight hours, were negative

A second experiment was then performed A single larva was decapitated to insure that biting would not occur and was placed with its back in contact with the skin, on the flexor surface of the forearm, from which the previous eruption had completely subsided. Bright red papules appeared around the test site in about four minutes, within the next twenty minutes these papules became more numerous and increased in size some taking on an urticarial cast As the urticarial tendency was developing the older papular lesions on the neck and on other distal sites became urticarial with considerable diffuse redness as well as circumscribed swelling (Fig 2)

Moreover scattered new urticarial papules were seen developing on the neck and forearms. The flare-up continued during the next few hours reaching its height in the evening, with diffuse redness swelling and transformation of some of the urticarial papules into vesicles. The entire course of the exacerbation was accompanied by pruritus the severity of which paralleled the development and course of the new lesions.

In a third experiment several hairs of the larva of the beetle were detached and applied to an area free from dermatitis on the opposite forearm. Satellite papules and a minor distal exacerbation were seen to appear but were less marked and less numerous than in the previous experiment. The difference in reaction may be explained however by the fact that the hairs were applied parallel to the surface of the skin, whereas when the intact larva was placed on the skin the hairs were more numerous with many projecting down on the skin perpendicularly

A control experiment was then performed. Recently decapitated beetle larvae were applied to the flexor surface of the forearms of three normal indi

Presented at the 14 nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Dermatology and Syphilology May 21 1918.

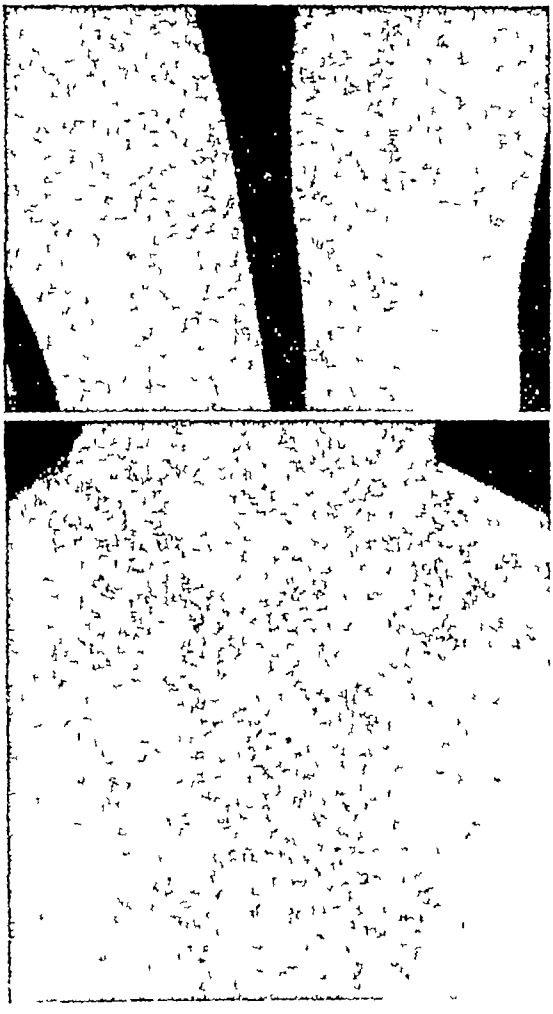

FIG 2 Urticarial papules appeared on the forearms (*A*), and the neck and upper chest (*B*), following a direct application of decapitated beetle larva.

viduals to eliminate the possibility of a uniformly toxic substance in or on the larval hairs No reactions were seen after a thirty-minute exposure

A biopsy was taken of one of the older papular lesions in a covered area on the upper chest The section was studied by Dr Wilbert Sachs, whose report was as follows The epidermis was slightly thickened The vessels of the mid and upper cutis were dilated, and some were filled with blood elements About the vessels was a pronounced cellular infiltration, composed of small round cells, wandering connective tissue cells, and an occasional polymorphonuclear cell In some areas the latter type of cell could be seen in the lumen of the blood vessels The Perl stain was negative, and no important changes were observed with the elastic tissue, Von Giemsa, or methylene blue stains It was felt that the above findings pointed to a mild "toxic" erythema multiforme rather than to a contact dermatitis It was assumed that absorption took place from the original lesions to produce the diffuse eruption in the noncontact areas

Management—Initially, the patient was given soothing lotions and pastes, but after repeated flare-ups occurring during overnight or longer stays in her apartment, the causative agent was identified and attention was directed to its extermination A large wall-to-wall carpet in her apartment was removed and a pressure method of extermination used Subsequently, the eruption following a few minor exacerbations on visits to neighboring apartments, permanently subsided

Life Cycle, Physical Characteristics, and Habits of the Causative Agent

There are two types of common carpet beetles extant in the United States, the first and most ubiquitous being A scrophulariae variously known as the common carpet beetle, the Buffalo bug, or the Buffalo moth [1–6] The second form is the black carpet beetle, or Attagenus piceus, which, while less common than A scrophulariae, is distributed widely throughout the country [1] Two less well-known varieties are the furniture and carpet beetle, Anthrenus vorax, and the varied carpet beetle, Anthrenus verbasci [2]

A scrophulariae in its adult form is a rather handsome beetle about $^3/_{16}$ of an inch long The body has a general background of black, spotted and speckled with white, with a red line down the middle of its back However, the adult beetle is seen only occasionally in temperate climates in the winter months, as it evolutes ordinarily from the larval stage in the late spring and lives only until the fall The adult insect is harmless, lives on plants and flowers, and is not destructive to cloths, rugs, etc Eggs are laid in the fall, and these hatch in about ten days into the larval form

The larvae inhabit warm houses throughout the winter months, grow rapidly, eat voraciously, and molt some six to eight times The larva is reddish-brown in color, of submarine shape, and about $^1/_4$ of an inch in length It is clothed with stiff, long, dark-brown hairs, those at the sides being longer than those on the back, while the hairs at the anterior and posterior end of the larva are longest of all The characteristics of the larva are shown in Fig 3

It is the larval stage of the beetle which causes destruction, holes are eaten in carpets, woolens, furs, cottons, silks, felts, feathers, and even bristles are attacked If food is scarce, the larvae eat their own discarded skins and may resist starvation for as long as ten months In the late spring or early summer the larva emerges into the pupal state, then, after one to three weeks, the adult beetle is formed In its adult form, the beetle lives only four to six weeks In the cooler climates, there is probably but one generation of beetles produced in a year, although at times the cycle may require two years or more In southern states and in warm houses, however, beetles may appear throughout the winter

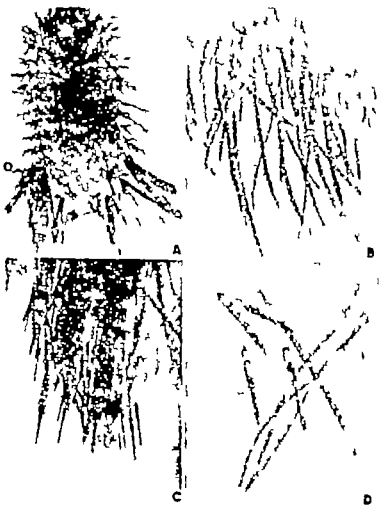

FIG 3. Hairy covering of beetle larva magnified 18 times (*A*) Body hairs of larva magnified 220 times (*B*) The tail tuft of larva hairs, enlarged 155 times showing barblike ends (*C*) Magnified 480 times, the hairs show barbs attached to the end of the hair shaft by a short constricted section (*D*)

Dermatitis from Beetles as Reported in the Literature

A thorough search through the literature, including the *Review of Applied Entomology* failed to reveal a single instance in which larvae of any of the four types of carpet beetle had produced a dermatitis

Various types of adult beetles however, may produce dermatitis in man All these beetles are classified as vesicating or blister beetles and are included under the name of the meloidae or the staphylinidae (rove beetles) [3] Of the rove beetles, Paederus which includes over 200 species is the only genus with vesicating properties The vesicating material is secreted in the reproductive organs and circulates in the blood plasma It is thought by some authorities to be cantharidin or a cantharidin-like substance and invariably produces its characteristic vesicating, effect on contact with human skin [4] The substance is a primary cutaneous irritant rather than a sensitizing material Ordinarily, the eruption develops some hours (up to twenty four) after contact and is characterized by bullae arising from apparently normal skin or by vesicles grouped in rows where the insect traverses the skin [5 7] In severe cases extensive dermatitis fever and debility may be present, as well as involvement of the conjunctivae [7 8]

The second class of insects which have a primary irritating effect on the skin is lepidoptera (moths and butterflies) [9] The larval (caterpillar) form of these insects has a marked netting effect when in contact with the skin, because of a poisonous secretion from cutaneous glands Thus secretion is extruded on or through the hollow center of spinelike processes intermixed with the hairy covering The most common urticating insects are the puss caterpillar and the larval forms of the following moths brown tailed flannel, saddle-back, satin hickory tiger, and buck types [5] The characteristic lesions are urticarial papulovesicular, or bullous and occur chiefly on the areas of contact. The eruption may resemble closely the dermatitis produced by the carpet beetle The puss caterpillar may also give rise to numbness weakness and peripheral paralysis [9]

Comment and Summary

It is evident that the present case is unique in that previous examples of dermatitis caused by beetles have been primarily vesicular or bullous and have been caused by an agent which produces uniformly a dermatitis on contact with the skin of man On the contrary the carpet beetle judging by its widespread habitat in the United States and the absence of recorded reactions has no primarily toxic effect on normal skin The papular urticarial, and vesicular lesions, as seen in the original dermatosis and in the later experimentally produced lesions are due apparently to hypersensitivity to the larval hairs It is believed also that the eruption is caused by local absorption transepidermal penetration and reaction in the vascular bed followed by vascular transportation and distal cutaneous response to the allergenic material

THE PERMANENT CAMOUFLAGE OF PORT-WINE STAIN OF THE FACE BY INTRADERMAL INJECTION OF INSOLUBLE PIGMENTS (TATTOOING)

HERBERT CONWAY, M D , New York City

(From the Department of Surgery, the New York Hospital, and Cornell University Medical College)

DEVELOPMENTS in the field of plastic surgery have resulted in the fact that increasing numbers of patients seeking obliteration of nevus flammeus (port-wine stain) present themselves for surgery Most probably this is accounted for by the dissatisfaction, expressed generally by patients and physicians, with current methods of conservative treatment of these abnormalities of the vascular bed of the surface of the body However, plastic surgery can offer only the complete removal of the lesion, together with the overlying regional skin, and in this respect is no better than the destructive nonsurgical methods of attack These nonsurgical methods, aimed at obliteration of the nevus flammeus by fibrosis of the abnormal bed of capillaries, include the following electrodesiccation, cauterization, distance application of ultraviolet light, carbon-dioxide snow, liquid air, ignipuncture, electrolysis, Kromayer therapy, x-ray and radium therapy It is apparent that all these methods must be applied to the lesion through the skin, even though the skin itself may not be involved in the angiomatous process

In order to destroy the port-wine stain, the regional skin also must be damaged Deforming scar, the result of injury to the skin and subcutaneous tissue, replaces the port-wine stain if the given treatment is effective in destroying the lesion Since these lesions do not undergo malignant degeneration and do not increase in size with the passing of years, it is at once apparent that the ideal treatment is a method which will remove the objectionable feature of the port-wine stain and still preserve the skin of the area Recognizing the fact that the only objectionable feature of this lesion is its abnormal color—red, blue, or purple—the problem reduces itself to the simplicity of camouflage of its color It is well known that permanent change in the color of skin may be effected by injection of nonabsorbable pigments into the derma In a high percentage of port-wine stains the abnormal capillary dilatations are subdermal or in the deeper portion of the derma In such cases the superficial derma lends itself well as the carrier of a permanent camouflage of pigment particles

HISTO PATHOLOGY OF PORT WINE STAIN

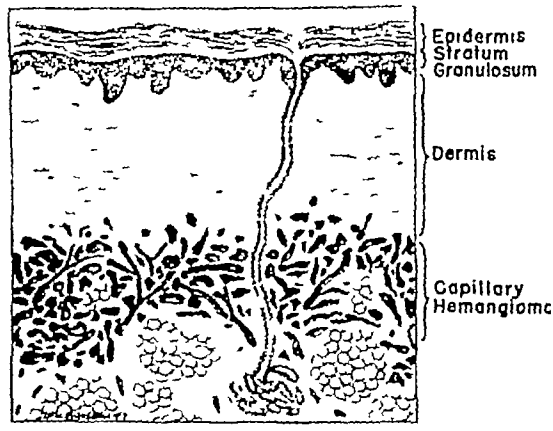

FIG 1 Artist's sketch of the relationship of the subdermal variety of port-wine stain to the overlying derma

Figure 1 is an artist's sketch of location of the capillary bed in a case of subdermal nevus flammeus The interpretation of the abnormal color of the port-wine stain is that the red, blue, or purple hue in the particular lesion is dependent upon the number of red blood corpuscles amassed in the abnormal capillaries, their degree of oxygen saturation (affecting as it does the coloration of erythrocytes from red to blue), and the reflection of this red through the overlying skin The variable amount of melanin in the stratum granulosum also contributes to the composition of the color effect of the port-wine stain

Historic Background

Tattooing for religious, ornamental, and identification purposes is reported as early as 2000 B C in Egypt and 1100 B C in China Today tattooing is used for these same reasons Savages still practice tattoo as a method of tribal identification, and civilized people still employ it for physical decoration The use of tattooing as a form of medical therapy can be traced to 1835, when Pauli employed it in the treatment of nevi, "congenital purple placques" and other lesions of the skin [1] Cordier (1848) advocated the tattoo treatment of nevi [2] In 1879 de Wecker used India ink successfully in coloring the corneal parenchyma [3] Thirty-two years later, in 1911, Kolle

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Dermatology and Syphilology May 21 1948

reported the use of tattooing with rose pigment to change the contour of the vermilion border of the lip [6] He also reported that nonadherent, flat, white scars were improved in appearance by the use of tattooing Knapp (1925) and Duggan and Nanavati (1936) used gold and platinum chloride to tattoo scars of the cornea [7] [8] Pickrell (1946) has demonstrated evidence in color photographs of excellent results following the tattooing of the cornea [7] In the recent literature Hance, Brown, Byars, and McDowell (1944) called attention to the value of tattooing in the matching of color of skin grafts and flaps on the face and in the simulation of the vermilion of the lip [9] Byars (1945) also reported successful intra dermal pigment injection for color matching purposes in 60 cases of free skin grafts and flaps of tissue on the face [9] Brown, Cannon and Mc Dowell (1946) reported improvement in appearance of one patient with a port-wine stain of the face following permanent injection of tattoo white and Chinese white [10] Conway and Docktor (1947) reported seven cases of port wine stain of the face treated successfully by tattooing [11]

Technic

The area to be injected is washed with soap and water, painted with aqueous solution of methiolate, and draped with sterile towels Instruments and pigments are sterilized The technician wears sterile rubber gloves The area should be free from infection At first the standard electromagnetic device (with needle holder and six needles attached) was used * This has been modified as shown in Fig 2 With sterile water the pigments are mixed into a thick paste which is placed in the cup of the needle holder The current which causes rapid oscillation of the needle is operated by a foot control The aqueous paste of pigments automatically feeds from the pigment cup into the needle holder as the needles oscillate in and out The needles are inserted into the skin at an angle of approximately 6 degrees so that the excursion of the needles will deposit the particles of pigment in an oblique plane at varying depths in the derma (Fig 3) Bleeding

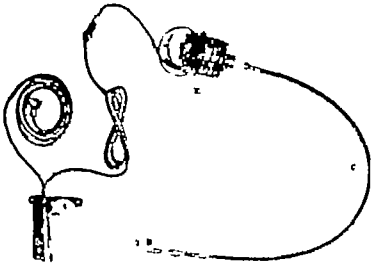

FIG 2. Photograph of the instrument now in use in the technic of permanent pigment injection The instrument has the advantage of feeding the pigment paste slowly from the pigment cup (*A*) into the hollow shaft of the needle holder (*B*) The rate of continuous flow of pigment paste is regulated by a screw The instrument is powered through a motor-driven flexible shaft (*C*) The oscillation rate of the needles is controlled by foot pedal (*D*) The instrument is quiet when in operation and the depth to which the needles penetrate is regulated easily (*E*) by the motor

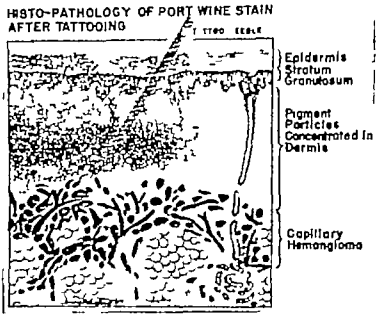

FIG 3 Artist's sketch of the technic of camouflage of port-wine stain by the intradermal injection of insoluble pigments. Those particles of pigment which are deposited in the derma reside there permanently Those which are deposited deep to the derma most probably are absorbed. Those particles which are deposited in the epidermis are desquamated eventually The process of desquamation requires that several weeks elapse after the first treatment so that the effect of intradermal injection may be judged fairly

and exudation of serum at the time of injection are managed by sponging between each application of the instrument.

The basic pigments in use at present include the following **

White	Titanium (or zinc oxide U S P)
Yellow	Oxide of iron
Red	Mercury sulfide (or cinnabar)
Red (flesh color)	Ferric oxide
Blue	Cobalt blue
Black	Black oxide of iron
Green	Hydrated chrome oxide

* The standard electromagnetic device was obtained from Burgess Battery Company "6 Ninth Avenue, New York City However this was equipped by the user with a shaft and five or six parallel needles. The instrument shown in Fig. 2 has been constructed by Frank Ellsen, M B Kassel and the author

** Pigment were obtained from Fezandie and Sperlle, "05 Fulton Street New York City

Combination of these pigments usually will produce the desired tints In addition, ochre, sienna, and other earthy metallic oxides may be used All these pigments are insoluble and may be sterilized in 70 per cent alcohol or may be autoclaved The mixture of colors varies with the individual case For the covering of port-wine stains, white is the basic pigment, occasionally mixed with a very small amount of red, sometimes in combination with green At the first treatment, a small area is injected and a record is kept of the combination of colors Following the treatment a sterile dressing is applied The patient is seen in twenty-four hours, at which time a crust is present over the injected area This peels away during the next six to ten days

Three to four weeks are allowed to elapse before judgment is passed on the effect of treatment Usually there is some absorption or desquamation of pigment during this period Though the greatest number of particles of pigment are deposited in the derma some are left in the region of the capillary dilatations and some are placed in the epidermis A few weeks must elapse before the effect of the absorption of the particles in the capillary dilatations and the desquamation of those in the epidermis can be judged Once the proper combination of pigments is decided upon, treatments may be given at two-week intervals until the entire lesion is injected An area of two to three square inches may be injected in a period of one hour by a skilled technician The number of treatments depends upon the size of the lesion The injection causes some discomfort, but the average individual tolerates this without anesthesia. In the treatment of children general anesthesia is necessary

Results

To date, 45 patients have been treated for port-wine stain by tattooing Experience indicates that not all port-wine stains respond equally well to camouflage by tattoo The variation in response is dependent upon the basic difference in the pathology of the lesions Andrews has classified port-wine stains as (*a*) subepidermal, those in which the abnormal capillaries lie under epidermis in the subpapillary zone of the skin, (*b*) dermal, those in which the abnormal capillaries are chiefly in the midcutis, and (*c*) subdermal, those in which the abnormal capillaries are in the subcutaneous tissue, subadjacent to the derma [12]

Since the inert pigments used in tattooing must be deposited in the derma if they are to remain permanently, it is apparent that this can be accomplished with ease in the subdermal variety of port-wine stain, effectively though less readily in the dermal variety, and not at all effectively in the subepidermal type It is this variation in the location of the abnormal capillaries which accounts for the difference in response of port-wine stains to permanent camouflage by tattoo

In the selection of cases for treatment, close scrutiny of lesion offers advance information as to the type of port-wine stain Biopsy is a more reliable guide However, it has been found that a given port-wine stain may be subdermal in part of its area, dermal in another, and subepithelial in a third portion In cases in which the degree of involvement of the derma cannot be ascertained accurately in advance, there is no objection to the trial treatment of a small portion of the lesion Bleeding and exudation of serum is encountered in the treatment of the dermal variety, but this is easily sponged away as the treatment is in process However, ready and bothersome bleeding at the time of tattoo puncture is evidence that the lesion is very superficial, that is subepidermal, and this observation carries with it the prognosis that tattoo treatment will not be effective In six cases the patients have been advised against tattoo treatment because of the establishment, by this observation and by biopsy, of the diagnosis of subepidermal variety of port-wine stain

It has been observed that a port-wine stain over the cheek, eyelids, nose, and upper lip may retain the pigment well in the malar and palpebral areas but not so well over the nose and lip In such cases repeated treatments over the skin of the nose and lip have been rewarded by successful camouflage In this detailed technical work the attitude and the ability of the technician are of the utmost importance The temperament of the average physician does not fit him for this work The treatment calls for the employ of a technician who appreciates the mixture of colors, who has a knowledge of aseptic technic, and who has patience and persistence More often the technician rather than the patient may become discouraged

Successful completion of treatment has been accomplished in 19 of 45 cases Twenty-six cases are still under treatment In the completed cases the lesions varied in size The largest was one which involved the surface areas of the upper and lower eyelids, the forehead, the entire cheek, one half of the nose and one half of the upper lip Sixteen treatments were given over a period of thirty-six weeks before treatment was completed One other case required sixteen treatments, but the majority of the other completed cases were lesions of 5 to 6 square inches, and for these the camouflage was completed in 5 to 8 treatments Two cases involved relatively little surface area and camouflage was effected after three treatments

Complications have been limited to experience in two cases In one of these there was regional cellulitis requiring hospitalization and therapy with antibiotics There was no resultant scar of the skin In the second case, a child of five years, subjected to other anesthesia each month for five months developed air-swallowing and symptoms of neurosis Temporary cessation of treatment resulted in relief from symptoms In six cases, as mentioned above there was excessive bleeding at the time of treatment Biopsy established the diagnosis of subepidermal type of port wine stain Therapy by pigment injection was discontinued and plastic surgical excision of these lesions is being carried out.

Summary

The permanent camouflage of port-wine stain of the face by the injection of insoluble pigments (tattooing) is presented Experience gained in the treatment of 45 cases has indicated that port wine stains of the dermal and subdermal type lend themselves well to camouflage by tattoo while those of the subepidermal type do not Cases are selected for treatment by close scrutiny of the lesion, by resort to biopsy and by trial injection of permanent pigments A modified electromagnetic device utilizing six parallel needles and a feeding cup for the pigment paste is described Of the 45 cases reported on, treatment is completed and satisfactory in 10 and still in process in 26 cases. In six cases the camouflage by tattoo was abandoned because of evidence that the port-wine stain was of the subepidermal type.

The opinion is advanced that port wine stains of the subdermal and dermal types the only objectionable feature of which is their color can be camouflaged permanently by the intradermal injection of insoluble pigments.

525 East 68th Street

Discussion

Dr Arthur W Gilck, *New York City*—Of the many methods used in the treatment of the port-wine stains I have observed none has been as acceptable to me as the method Dr Conway has presented.

The physical methods used by most dermatologists such as electrodesiccation CO_2, blistering doses of ultraviolet light etc. leave much to be desired, because the resulting scarring sometimes is worse than the original appearance of the lesion The same is sometimes true when a large lesion is excised and followed by skin grafting.

The operator must have a good color sense, although this is not too important in tattooing port-wine stains inasmuch as white pigment is used to counteract the intense erythema of such lesions However matching vitiliginous skin or skin grafts to the adjacent normal skin is not easy In fact an artist can match the pigments on the surface of the skin, but it must be remembered that color has to be reflected from the tattooed pigment which is below the skin. The resulting reflection of color is often not what one would expect or desire

The improvement is so dramatic in some cases that the patients have a new outlook in life They become gregarious, less shy and develop confidence in themselves. Patients who have used a heavy mask type of cosmetic such as made by Lydia O Leary now find that they can use a less complicated type of makeup which does not look so artificial and is easier to apply

Since most dermatologists are nihilists when such patients consult them I feel that now we can add another modality of great value in the treatment of port-wine stains. And for this I am grateful to Dr Conway for reintroducing a valuable cosmetic procedure.

FEWER TWINS

Multiple birth appears to be a primitive rather than a lately acquired trait, and mankind is apparently losing the ability to produce more than one infant at a birth Dr A H Schultz of the Johns Hopkins University Baltimore believes An evolutionary decrease in the number of twins and triplets is shown by comparing present human procreation with that of apes and monkeys, which are much more apt to produce multiple births —*Modern Medicine July 1 1948*

THE PRACTICAL APPLICATION OF LOCAL HEAT

JOHN D CURRENCE, M D , F A C P , New York City

(From the New York Post-Graduate Medical School and Hospital)

TODAY physiotherapy is assuming an increasingly important role in the treatment of many diseases, metabolic as well as post-traumatic Hence, because of the problem of the application of local heat as a therapeutic agent, a comparison and evaluation of the practical application of local heat was made in our clinic Innumerable methods have been used to test the relative effectiveness of the several heat-inducing mechanisms, but the superfluity of the reports indicates a number of variables involved in the measurement of heat actually delivered to the tissues For example, the thermocouple method measures not only the local tissue temperature rise but reflects the influence of many other factors, such as environmental temperature, humidity, perspiration, local blood supply, and certain systemic temperature-regulating mechanisms Heat is conveyed to the tissues by induction (as in hot water bath), by radiation (infrared lamp), and by penetration (short-wave diathermy) [1-8]

As stated, hot water baths heat the body by conduction The prevention of evaporation of perspiration helps to increase the heat of the tissues in contradistinction to hot air baths, which, by the cooling effect of the evaporation of sweat, actually delays the heating of the tissues or at least requires much higher temperature over a longer period of time to accomplish the same effect [7] The value of the modern whirlpool bath lies in the fact that higher temperatures may be borne more comfortably than still water and that the improved method of hydromassage permits direct application of a controlled underwater stream of bubbles of constant intensity The effect of this massage increases superficial vasodilatation and mechanically and reflexly increases tissue metabolism

Granted that the practitioner wants to employ heat as a therapeutic agent, the question is which form of heat shall he use? Naturally, he should be guided by the following criteria of any method employed First, which type of heat is most effective or efficient? Second, is the method safe? Third, is it economical?

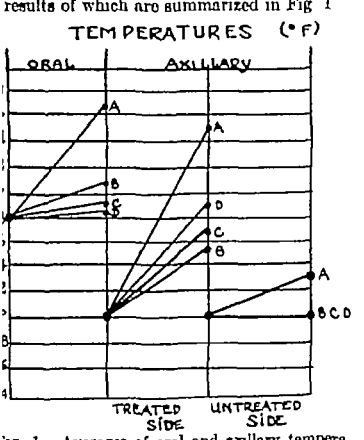
To answer the first question, i e , to determine the relative effectiveness of the various types of heat therapy as applied in the physician's office or in the hospital, a study is here reported on the comparative local and systemic effects of the whirlpool bath, short-wave diathermy, and the infrared lamp on a group of normal volunteer subjects Two series were run, being limited to fifteen and twenty minutes of heat application, respectively

In the first series 44 observations were made on 22 individuals The subjects were first given short-wave diathermy to the right arm (a cuff electrode placed under the hand) On another occasion the subject inserted the arm, to a point midway between the shoulder and the elbow, in a radiant heat beaker at 120 F Three-minute oral temperatures were recorded In the second series of 18 cases, both oral and axillary temperatures were recorded Oral and axillary temperature elevations were used as a means of comparing the effectiveness of the various forms of treatment This method, instead of thermocouples or other alternatives, was used, since it offered as little departure as possible from ordinary clinical practice and produced a minimum of disturbance to the subject The subject was not allowed to partake of food or drink for at least thirty minutes before the beginning of the study, and he remained in a resting state during this period The environmental temperature, humidity, and barometric pressure were recorded, although no effort was made to control these factors, moderate variations were encountered with no appreciable effect on body temperature of the subject treated or other controls in the room during the experiment In these series no two clinical procedures were used on the same subject in any one day

The results of the first study paralleled the findings of the second series The results of the second series, therefore, are included because of greater completeness

In the second series the procedures were as follows

1 Immersion of the arm to the midpoint of the humerus in a whirlpool tank which was equipped with hot and cold inlets and an agitator Temperature of the water was elevated from 106 to 110 F in the first five minutes and held at 110 F for fifteen minutes Oral and axillary temperatures were recorded at the beginning and at the end of the treatment



2 Second procedure was a twenty-minute exposure of the arm to infrared radiation of maximally tolerated intensity, with radiation from above only

3 Short-wave diathermy was employed by

This work was supported by research funds from the Section of Physical Medicine of the Department of Medicine New York Post Graduate Medical School and Hospital J F Marshand M D F L Eby, M D G Burke M D , E Swanson and H Sullivan assisted in the project

ig electrodes over the hand and over the belly
ie biceps muscle
. Induction coil diathermy applied around
arm from the hand to midpoint of the
ierus

This concluded the types of heat applications
results of which are summarized in Fig 1

'IG 1 Averages of oral and axillary tempera
es (F) of normal subjects prior to and following
local whirlpool, (*B*) infrared lamp (*C*) electrode
thermy, and (*D*) induction coil diathermy to
arm for twenty minutes

Under these conditions the rise in oral tempera
e during the whirlpool treatment was an aver
of 0 77 F , during the infrared radiation an
ange of 0.22 F , and during induction-coil
thermy an average of 0 13 F
As evidence of local heat absorption by means
venous circulation axillary temperatures were
lowed on the treated and untreated sides On
untreated side the axillary tended to parallel
oral temperature, while on the treated side it
owed a greater temperature rise than was found
dly This rise may indicate a temperature in
ease in the vascular bed of the extremity
ated
Most of the subjects experienced a mild warmth
the skin, and cutaneous hyperemia of the
ated part was noted especially with radiant
at and whirlpool Perspiration was very mild,
d none complained of more than slight dis-
mfort Following whirlpool, there was more of
sense of relaxation and warmth in the treated
remity The tissues were remarkably softened
arm appeared slightly larger rings fitted
ore tightly and the erythema of the arm
ually persisted for two to three hours. In all
ses the oral temperature returned to pretreat
ment levels within half an hour, usually within
twenty minutes

In a subsequent series, 25 patients suffering with rheumatoid arthritis were given hydrotherapy, each treatment lasting for a period of fifteen minutes Since, in our experience, this type of heat has proved most satisfactory in the treatment of arthritis it was decided to determine the effects of heat conduction on the erythrocyte count hemoglobin concentration, the leukocyte, and differential count, and on the erythrocyte sedimentation rate in normal persons and in patients with rheumatoid arthritis A modified Westergren method was used in the determination of the sedimentation rates Only arthritic patients having elevated sedimentation rates were used in this series Briefly, there were no essential changes in the erythrocyte count, hemoglobin concentration, white blood count and differential count, or in the sedimentation rate before and after the treatment

Blood pressures were not altered by any form of treatment except for decreased pressures as basal conditions were obtained

As a control for the study of the effect of local heat therapy on the oral and axillary temperatures five subjects were followed under conditions simulating those of the experiment, except that no heat therapy was given. In these instances there was no oral or axillary temperature that rose nor was there a decline toward normal when the initial temperature was higher than 98 7 F

Discussion

In an effort to evaluate the best method of heat application on extremities for hospital and office use it is apparent that all methods of local heat are effective in some degree However these studies compare favorably with previous work, in which the whirlpool bath was shown to be the most readily tolerated and the most effective in intensity of heat delivered and in the extent of peripheral circulation and relaxation experienced by the patient.[4,8–12] Clinically we have observed that hydrotherapy is superior to other forms of heat therapy, as confirmed by our experimental results, and offers an opportunity for active and passive exercise during the treatment.[12] The continuous stream of bubbles from the agitator which affords a constant and controlled massage and resultant relaxation of spasm in the tank permits greater muscular activity during the application of heat than any other form of heat therapy It is our clinical experience with over 3 000 cases that this mode of treatment gives the best therapeutic response with the least number of treatments

It is also of note that as a practical method of heat therapy on extremities diathermy is less

efficient than whirlpool, and although infrared lamp is convenient and not particularly hazardous, it, too, is less effective The depth to which heat was transmitted was not measured However, it is seen from the rise in axillary temperature that heated blood from the capillary beds in the skin transported heat to deeper tissues by way of veins (Fig 1)

Summary

1 In 18 normal subjects, exposure of the arm to varying types of heat therapy for twenty minutes caused elevations of body temperatures, as determined by oral temperature, showing the greatest rise following hydrotherapy

2 Indicative of deep heat transmission, axillary temperatures on the treated side of 18 normal subjects showed rises greatest after hydrotherapy

3 The erythrocyte count, hemoglobin level, leukocyte count, differential count, and the sedimentation rate were essentially unchanged in 22 normal subjects and 25 arthritic patients following fifteen minutes of hydrotherapy

4 Hydrotherapy in the form of whirlpool bath is the best modality of various heating agents employed for therapeutic purposes on an extremity (e g , the arm), because of the following factors

(*a*) Efficiency—Local hydrotherapy has been shown by us and by others to be the most effective means of repeatedly increasing local and systemic temperatures within the safe degree of application

(*b*) Safety—No untoward reactions, subjective or objective, were observed No special technical skill is required for the administration of heat in this form

(*c*) Comfort—Salutary psychic benefit of hydrotherapy on the patient is well known The relaxing effects relieve painful muscle spasm and render them more amenable to massage and exercise

(*d*) Low Cost and Availability—Hot water is available to the most isolated practitioner and most underprivileged patient The cost is that of heating the water Additional use of hydromassage provides the advantage of intensifing hyperemia and helping to further relax spasm

Conclusion

Hydrotherapy is pre-eminently the most desirable modality for the use of local heat on extremities

PRO RATA PAYMENTS REPAID BY BLUE SHIELD IN BUFFALO

Western New York Medical Plan, Buffalo, has begun to repay amounts withheld from its participating physicians during the years 1941 to 1946, when pro rata payments were made

Most Blue Shield Plans have agreements with their participating physicians in which the doctors agree to accept pro rata payments for their services during any accounting period in which the Plan does not have sufficient funds from which to make full payment Such agreements serve as an underwriting guarantee for the Plan in lieu of large cash reserves

Total amounts withheld from Buffalo doctors during the six-year period were

1941	$3,975 65
1942	9,627 33
1943	18,855 54
1944	18,148 25
1945	6,543 38
1946	172,146 01

On May 26, 1948, the full amounts for 1941, 1942, and 1943 were repaid, and permission is being sought currently from the New York State Department of Insurance for the repayment of the amount withheld during 1944 The outstanding obligation for 1945 is relatively small and is expected to be retired within sixty days

The largest portion of the 1946 obligation is due to the suspension of all physician payments during November and December of that year when the doctors determined to forego their own fees in order to make the Plan solvent It is expected that the final payments will be completed within the next year

AMINOPHYLLIN DETERMINATION OF CIRCULATION TIME

LOUIS FRIEDFELD, M D F A C P HERBERT R MARCUS, M D , and JEFFERSON J VORZIMER, M D , F A C P , New York City

(From the Medical Services Beth Israel Hospital)

CIRCULATION time has been defined as the time interval required for blood to traverse a *given segment of the cardiovascular system, it is* essentially a measurement of the velocity of blood flow [1] Direct measurement of blood velocity in man has thus far been technically unfeasible, and the determination of circulation time has proved a clinically applicable velocity gauge [2] This time varies inversely as the average blood velocity the more rapid the rate of blood flow the shorter being the circulation time

A wide assortment of test substances has been used in an attempt to obtain a simple yet accurate *estimation of circulation time* The rationale has been the intravenous injection of a test substance and the observation of some subjective or objective manifestation as an end point, *timing* its arrival at a given organ or center Among the substances that produce a subjective end point are sodium dehydrocholate, calcium gluconate saccharine thiamin, etc , which produce variations in taste, smell and warmth The materials in this group have the advantages of being readily available relatively nontoxic, and not requiring extensive or unusual apparatus However since the end point is a purely subjective sensation, the accuracy of the time determination depends upon excellent patient cooperation This limits the use in children and uncooperative or mentally disturbed individuals.

The second group of test materials induces an end point which may be measured by objective means eliminating the important and variable factor of the patient's active cooperation As a group, however, their use is somewhat limited by the apparatus required and by the frequently encountered undesirable side reactions. In this category are such materials as histamine, sodium fluorescein, sodium cyanide, and radioactive substances.

It seemed logical to utilize the well-known effect of aminophyllin in causing a suddenly deepened and rapid respiration for the determination of the circulation time between the antecubital vein and the respiratory center Our experience with aminophyllin used for this purpose began in 1941 after the effects were noted in the treatment of Cheyne-Stokes respiration. The first report on the use of this drug in the determination of circulation time appeared in 1943 [3]

Following the rapid intravenous injection of 0.25 Gm of aminophyllin dissolved in 1 cc of solution, there is generally an explosive respiratory response manifested objectively as a sudden deep gasp tightening of the abdominal musculature, cough, or tachypnea Flushing of the face may also be apparent Subjectively, there may be a sensation of warmth in the head lightheadedness or vertigo These symptoms are transient in nature and are dissipated in one or two minutes Tachycardia and palpitation may occur and are of similarly short duration

The xanthines are known respiratory stimulants and act by direct stimulation of the respiratory center [4] Starr and his associates have demonstrated a 23 8 per cent increase in respiratory volume in subjects under basal conditions after the intramuscular injection of 0 48 Gm of aminophyllin [5] Sperling *et al* in a study of 22 patients graphically demonstrated an increase of 51 per cent in the depth of respiration following intravenous use of this drug [6] This direct and prompt reaction of aminophyllin on the respiratory center eliminates any time delay such as is noted with the sodium cyanide method

Method

In our series of cases it was found that accurate and definitive results were obtained with but simple preliminary preparation. The measurement of the circulation time with aminophyllin was determined on patients in the hospital in the outpatient department and in private offices (Table 1)

TABLE 1 —CIRCULATION TIME COMPARISON IN COMPENSATED PATIENTS

Pathologic Conditions	Aminophyllin (Seconds)	Saccharine (Seconds)	Calcium Gluconate (Seconds)
Coronary occlusion	12	17	
Chronic asthmatic and bronchitis	14	13	
Chronic osteomyelitis	12		12
Rheumatic heart disease inactive	17		17
Arteriosclerotic heart disease (no failure)	17	27	17
Hypertensive heart disease	10		18
Chronic gastritis	14		15
Psychoneurosis	15		24
Chronic cholecystitis	16		16

The patient is placed in a supine position and 1 cc. of a solution containing 0.25 Gm of aminophyllin is injected as rapidly as possible into the antecubital vein Timing is done with a stop watch and calculated from the beginning of the

TABLE 2.—Case Incidence

Circulation Time in Seconds	Cases	Per Cent of Total Cases
8 to 11	7	8 6
12 to 15	40	49 4
16 to 17	25	30 8
20 to 23	8	9 8
24	1	1 2

injection to the first appearance of respiratory stimulation In the beginning of this series we experimented with 0 5 cc containing 0 125 Gm of the test substance injected over a period of two to four seconds We found, however, that there were more failures and a greater percentage of indefinite end points than when 1 cc of the test material was rapidly injected

Results

Tabulation of the circulation times obtained in this series reveals close approximation to the results obtained by the other methods that utilized either test materials with subjective end point or objective measurements with various photoelectric cells, ultraviolet light, or radioactive counters The time in the majority of our normal cases (80 2 per cent) varied from twelve to nineteen seconds, with an average time of fourteen and six-tenths seconds (Table 2) This was found to be true even in aged patients without congestive heart failure, in whom we found not only normal circulation time but also sharp and definitive end points (Table 3)* This is in contradistinction to the findings of other investigators who found prolonged circulation time in elderly people who were not in congestive heart failure As might be expected a series of 12 cases of known hyperthyroidism disclosed very short circulation time ranging between nine and eleven seconds (Table 4) A group of cases of frank congestive heart failure (Table 5) disclosed essentially the findings of previous investigators, i e , prolonged circulation time which varied from twenty-four to thirty-eight seconds In these patients, corroboration was obtained by the use of the saccharine and calcium gluconate methods with close correspondence of the several test substances used As the congestive heart failure was relieved by appropriate measures, a corresponding decrease in circulation time was noted

TABLE 3.—Circulation Time in Elderly Patients

Patient's Condition	Age	Time (Seconds)
Pyelonephritis	75	13
Osteoarthritis	72	17
Polyposis of colon	65	15
Hypertensive heart disease	65	15

TABLE 5.—Circulation Time in Patients with Congestive Heart Failure

Clinical Condition	Aminophyllin	Saccharine
Arteriosclerotic	24	22
Coronary thrombosis	26	25
Hypertensive and arteriosclerotic	24 and 27	25
Rheumatic heart disease	20	21
Chronic bronchitis with emphysema	26	63 plus
Arteriosclerotic	32	25
Hypertensive	24	26

As with other methods, a small percentage of patients tested failed to react with a recognizable end point In our series, this was true in 4 7 per cent of the subjects However, in certain instances when there was no response to the more common testing substances, aminophyllin gave a definite end point The reverse situation was not noted

Toxicity

Aminophyllin has been used in many conditions and, despite the trepidation with which it is used intravenously, the literature contains a dearth of fatal accidents Merrill, in 1942, reported three cases of sudden death in elderly cardiacs following the slow intravenous injection of aminophyllin [7] Another report has appeared recently with similar results in three desperately ill patients, two suffering from acute coronary thrombosis and one in terminal uremia [8] The cause of these deaths remains obscure

While we have encountered no serious adverse reactions, we believe that this method should not be used at this time in the presence of possible internal bleeding, advanced cerebral-vascular disease, peptic ulcer, or coronary thrombosis Its chief applicability would be in those situations where the ordinary subjective methods are impractical due to failure of the patient to cooperate

Discussion

The chief practical value of the determination of circulation time is in those patients in whom the cardiac or pulmonary cause of dyspnea must be differentiated, as well as in the evaluation of changes in the degree of congestive heart failure [9] This problem arises often in elderly people in

* Studies in the aged were made with the cooperation of the Home of Old Israel

dyspnea may be due either to a failing usually arteriosclerotic, or to senile em ma and chronic bronchitis In the former tion, the circulation time is prolonged in tter it is unchanged This observation has as definite with the aminophyllin test d as with others previously used In cer ess commonly encountered types of heart e (with hyperthyroidism, severe anemia ri, or abnormal arterial shunt) the circula ime may be rapid even in the presence of stive heart failure because of peripheral dilatation or increased cardiac output, or and in vascular shunt In chronic pul ry disease the systemic blood velocity is ly normal

e method of determining circulation time by se of aminophyllin is readily applicable in tal clinic office or home It requires no sive preparation of the patient no unusual cialized apparatus and may easily be per- d by the physician himself without as- ts or even the active cooperation of the nt

encountered no important constitutional ons or serious local complications either due e rapid injection of this concentrated sub- e or following accidental extravascular in- filtration Local sloughs or phlebitis were not noted

Conclusion

The rapid intravenous injection of 0.25 Gm of aminophyllin in 1 cc. of solution is a practical and effective method of determining circulation time The end point is the objective manifestation of a sharp respiratory response. In our series, there have been no important systemic or local toxic effects This method has special applicability in those cases where the ability of a patient to cooperate in the determination of a subjective end point may be limited by age, language difficulties, cerebral changes, or state of consciousness

E OF QUICK POLIO TEST

pe of a quick and simple test for the infantile ysis virus to replace the expensive monkey test used is revived by a report from Dr Pierre epine, of the Pasteur Institute Paris to the al *Science* (August 6)

h a test would help doctors tell positively ner a child with a little fever and upset stomach ample is infected with the polio virus or just g an attack of the now prevalent summer e.

addition it would speed trials of new drugs for since doctors trying them could be sure they given to actual cases of infantile paralysis At nt this is difficult to determine and lack of such ledge means a drug must be tried in very many before doctors can be sure it is successful

orts to learn how epidemics spread could also eeded by a simple test inexpensive enough to rm on every suspected case

Lepine s test is simple enough. Essentially, sists in injecting material (feces) from suspected patients into the brains of five mice. Two days later the mice are given an injection into the brain of active Lansing mouse-adapted polio virus. At the same time another five mice are injected into the brain with the Lansing virus only Within ten or eleven days at least four out of five of these last mice should be dead or paralyzed. But at least three out of five mice also injected with the suspected polio material should be alive and well. The virus they got from the patient would have protected them against the fatal dose of Lansing virus that killed or paralyzed the control mice If the material did not protect them the patient did not have polio

This kind of test called interference protection has been tried before by other scientists but has not proved successful Whether the details of Dr Lepine s test such as method of concentrating the material from patients method of inoculation and time intervals, will make the difference between success and failure of the test remains for future study to determine Also to be learned is whether the test will succeed with other strains of polio virus.—*Science News Letter August 14 1948*

CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stenographic reports of conferences by the members of the Department of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital, with collaboration of other departments and institutions The questions and discussions involve participation by members of the staff of the college and hospital, students and visitors A selected group of these conferences is published in an annual volume, Cornell Conferences on Therapy, by the Macmillan Company

Treatment of Painful Disorders of Skeletal Muscle

DR WALTER MODELL The conference today deals with the treatment of painful disorders of skeletal muscle That pain of this sort presents a therapeutic challenge is demonstrated by the length of the list of measures used in treating it Here is a list compiled by Dr Travell

1 Psychotherapy
2 Heat, massage, baths, electrotherapy
3 Deep x-ray therapy
4 Active and passive exercises
5 Supports, braces
6 Manipulation
7 Surgical section of muscle (e g , scalenus anticus)
8 Curare
9 Neostigmine (prostigmine)
10 Quinine
11 Ammonium chloride
12 Vitamin E
13 Nicotinic acid
14 Analgesics salicylates, morphine, codeine
15 Intravenous procaine
16 General anesthesia
17 Regional nerve block
18 Local block of trigger areas infiltration, needling, ethyl chloride spray

Dr Travell will open the discussion

DR JANET TRAVELL I shall confine my remarks to a special group of patients These are patients whose activities are limited by pain That is the complaint which brings them to the physician The pain is usually accompanied by restricted motion of one or more joints The limitation may be gross, or it may only be discovered by carefully testing the range of motion of special muscle groups Occasionally, limitation of motion cannot be demonstrated Localized areas of deep tenderness are always present in one or more of the muscles about the joints which exhibit limitation of motion, but signs of acute inflammation, such as redness, heat, and swelling, are lacking A change in contour due to spasm of a muscle or portion of a muscle is occasionally mistaken for swelling due to tissue exudate, but this does not happen often Some of these patients are confined to the house or bedridden, but the majority of them are only partially disabled and are working under serious handicaps Thus, most of them are ambulatory, and they make up a large percentage of the patients who come to the office of the general practitioner or to the outpatient department of the hospital

There need be, and often is, no demonstrable organic disease The syndromes under discussion are usually referred to by such terms as stiff neck, painful or frozen shoulder, tennis elbow, lumbago, sciatica, painful knees, etc , terms which do not imply any special etiology Of course, there has to be a cause One difficulty in the way of establishing the etiology is the fact that these disorders seem usually to be due to a combination of factors

Among the manifest causes, the foremost is probably trauma The role played by trauma is obvious in the muscular spasm associated with joint sprains, fractures, or contusions, but the role of trauma may be equally important even when the injury is slight or of such a nature that its connection with the pain syndrome is not readily traced The relationship is often overlooked because spasm is apt to develop gradually after minor injury and thus may not become painful until even a few days later This applies not only to the effects of a sudden wrench or jerk noted at the time, but also to the muscular pain and stiffness which may follow an unusual kind of exercise or excessive exercise

Less frequently recognized and equally important as a cause of pain is chronic muscular strain In this connection we must recognize that hurry, with its inefficiency of muscular movements, as in writing or ordinary household duties, places an increased load on the muscles Just as it takes more gasoline to drive a car a given distance at 60 miles per hour than at 30 miles per hour, there

are speeds of muscular performance for optimal efficiency, and beyond these conditions of hurry at work create in effect a form of muscle strain

Another precipitating factor in muscular pain is chilling the body as a whole, or cooling a specific area This effect is apparently achieved not only when the thinly dressed person stands in a biting winter wind but also on a hot summer day when the perspiring golfer sits in a gentle breeze under a shady tree on the nineteenth hole of the golf course. Pain is apparently more apt to result from chilling, when a person is fatigued Bierman inserted electrodes directly into the voluntary muscles and found that cooling the skin by a current of air resulted in a prompt fall of muscle temperature presumably due to reflex vasoconstriction It may well be that this vasoconstriction plays a part in producing the pain

Visceral disease is an important cause of painful spasm of the voluntary muscles There are familiar examples of such visceromotor reflexes for instance, the localized muscular spasm or abdominal rigidity which accompanies acute appendicitis or any other variety of the acute surgical abdomen Another example is the splinting of the chest muscle in acute myocardial infarction It is not well known, however that visceral disease may lead to persistence of pain patterns established during the acute attack and furthermore, that this intractable pain sequel may be amenable to local block of trigger areas located in the spastic skeletal muscles

The etiologic factors in painful muscle spasm also include certain neurogenic causes I have in mind particularly nerve root irritation due to pressure for example, by a herniated intervertebral disc The painful cramps of peripheral neuritis as noted in vitamin B deficiency, should be mentioned Other precipitating factors include the toxins of acute and chronic infections—tetanus for example Certain metabolic factors may play a role in the development of spasm A high proportion of patients with such chronic muscular pain have low basal metabolic rates of the order of minus 15 to 20 per cent. A few show a slight anemia with 65 to 75 per cent hemoglobin In other patients psychogenic factors seem to play a predominating role in the etiology of painful muscular spasm. When any of these factors is present pain may be only temporarily relieved or may remain quite refractory to local treatment of the affected muscles until the basic disorder is corrected This applies also to trauma induced by continuing or repeated muscular strain but not to a single episode of trauma after which the results of local block may appear truly miraculous

I have been asked to discuss certain therapeutic measures directed at the muscle itself namely local infiltration of the intramuscular trigger areas and the application of ethyl chloride spray to the overlying skin We may group these procedures under the term "local block" therapy, in contrast to "regional nerve block."

The theory underlying this kind of treatment is that the painful spasm is an expression of a reflex which, once initiated is self propagating Thus, spasm leads to pain, pain to further splinting and spasm, and so the vicious cycle sustains itself Brief interruption of this pain cycle at any point may abolish it permanently provided the conditions which initiated it in the first place are no longer intact.

To apply local block methods successfully, one should have a knowledge of the pain reference patterns of the different muscles of the body It is not widely known that each muscle gives rise to a specific distribution or pattern of referred pain which is relatively constant from person to person These patterns are not strictly segmental in distribution and they do not follow any peripheral nerve distribution. Once these patterns have been learned the sources of pain can be readily predicted The site of origin of the referred pain is commonly spoken of as a "trigger area" When one is infiltrating the muscle, it is this area which must be hit directly with the needle.

The presence of a trigger area within a muscle is demonstrated by the fact that when pressure is exerted on it or a needle inserted into it (which also exerts pressure), a spread of pain is clearly perceived by the patient in its specific reference zone. In other words, that spot is positively identified as the source of the pain felt at a distance. The reference zone, which can be mapped in this way by mechanical stimulation of the trigger area, should coincide with the region where the patient complains of spontaneous pain. If it does match one may be sure that at least one of the sources of pain has been found

Local Infiltration—For local infiltration we prefer a 0.25 to 0 5 per cent solution of procaine hydrochloride in physiologic saline There is no epinephrine in the solution It must be pyrogen-free, since the injection of pyrogens into these hypersensitive areas sets up intense afterpain for as long as several days Obviously care must be taken to insure asepsis The skin is cleaned with alcohol and painted with mild tincture of iodine On routine testing a small number of ampules have been found to be cracked or defective at the tip and therefore all ampules are boiled with the syringes and needles just prior to use. Some of the details of the local infiltration technic were presented at a previous therapy conference * and we have not changed them in any important respect since The kind of material used for infil-

* New York State J Med 45: 2090 (Oct. 1) 1945.

tration is not nearly so important as the place where it is put, provided, of course, that the material is not toxic Trigger areas can be blocked by infiltration with physiologic saline or merely by needling the area, with no fluid injected Thus, our observations confirm the benefits derived from the old Chinese technic of acupuncture Local infiltration or dry needling may be regarded as satisfactory when the procedure immediately abolishes local tenderness at the site of the trigger area, does away with the spread of pain induced by pressure, reduces the total quantity of spontaneous pain, and obtains an increase in the range of motion if limited It should be noted that the use of procaine makes the treatment much less disagreeable to the patient in that it cuts down the intensity and duration of the pain reference set off by insertion of the needle We have as yet no satisfactory data as to whether the addition of procaine increases the efficacy of treatment as compared with physiologic saline alone So far, we have not learned how to reproduce experimentally the abnormal state known as a trigger area

At the first treatment, it is usually wise not to inject many different muscles but rather to select one or two major trigger areas and obliterate them completely, by repeated infiltrations if necessary This is important, since incomplete blocking of trigger areas is one of the causes of increased pain following injection At the next visit, an evaluation is made of the results of the first treatment A satisfactory response to local block therapy may be predicted at this time (1) if there was marked amelioration of pain after the treatment, even though this lasted for only a few hours, (2) if the gain in motion which was noted immediately after injection has not been lost to any appreciable extent, and (3) if the activity of the treated trigger areas has been reduced, as indicated by a change in the intensity of the pain reference induced by pressure and needling If no appreciable benefit according to these criteria is noted after two or three treatments, it is not considered worth while to pursue this method further In fact, if substantial relief is not secured rapidly, the patient will usually not submit to any more injections, since the momentary pain set off by needling trigger areas of high spontaneous activity may be very intense An early appraisal of the results is, therefore, important

In acute cases, one treatment is sometimes sufficient to secure complete and permanent relief In longstanding cases, however, it seems that one muscle after another becomes involved in the process so that a multitude of trigger areas develop, and a series of treatments are usually required to eradicate all of these foci of pain The second treatment is usually timed from three to five days after the first, and subsequent treatments are given at intervals of a week or two, as indicated

Ethyl Chloride Spray—The use of ethyl chloride spray was described for treatment of ankle sprains by Cozen and Hollombe in 1940, and as "surface anesthesia for the relief of painful motion" by Kraus in 1941 We have likewise found that this procedure may at times relieve pain and limited motion associated with muscular spasm and in a manner that is sometimes remarkable The application of the spray is so simple that we are apt to try it as the first procedure in most cases The benefit to be derived from ethyl chloride spray can usually be estimated at once A particular trigger area is selected and its sensitivity to pressure is noted The overlying skin is then lightly sprayed during a period not exceeding two or three minutes, according to an interrupted technic which I shall describe, and the activity of the trigger area noted again As in the case of local infiltration, a good response may be expected if the spraying immediately abolishes or reduces deep muscle tenderness and referred pain on pressure, increases the range of motion, and reduces pain at rest or on motion If the effect of the spray as determined on one or more such test areas is not striking, we usually proceed at once to local infiltration with procaine If the effect of the spray is sufficiently encouraging, we may repeat this procedure at intervals as indicated, and an excellent result may be obtained by this method of treatment alone

We have found that attention to certain factors seems to increase the effectiveness of ethyl chloride spray, and we believe that the details are important The procedure, as we do it, is as follows

The patient is made comfortable and the part to be sprayed is well supported so that the muscles can relax The tube or bottle of ethyl chloride is held one to two feet away from the patient The spray is applied at an acute angle with the skin The stream is passed over the region of the trigger area in one direction at a uniform speed with an even sweeping motion The motion is not unlike that used in applying paint to a wall with a brush The ethyl chloride on the skin is allowed to evaporate, and, about one second later, the sweep is repeated in the same direction This "make and break" spraying is continued with a regular rhythm Sometimes only one passage of the spray over a given trigger area will cause it to disappear, but more often it requires 15 or 20 such sweeps One may occasionally observe transient activation of the trigger mechanism by the spray If the spray is painful at first or sets off referred pain when applied over the trigger area, the rest periods between sweeps are lengthened to allow the induced pain to subside In the intervals,

that part of the body which is being sprayed is moved gently within the limits of pain to stretch the affected muscle

It should be noted that the nozzles of the ethyl chloride containers vary a good deal A commercial make should be selected which delivers neither too fine nor too coarse a spray A very fine mist seems to be relatively ineffective, a heavy stream spatters and is unpleasant to the patient and also wastes the material.

We are also using ethyl chloride spray as an adjunct to local infiltration of trigger areas, that is as soon as the injections have been completed, the treated areas are sprayed in the above manner This procedure seems to reduce the muscle soreness or "lameness" which ordinarily follows trauma due to needling and is in line with the observation that ethyl chloride spray may permanently relieve pain due to trauma, such as joint sprain.

It seems scarcely necessary to mention that ethyl chloride is a highly volatile and inflammable liquid so that fire hazards must be eliminated It is also a general anesthetic agent and care should be taken that the patient inhale as little of it as possible Since the vapor is heavy, the patient's head should be above the part sprayed Some movement of air in the room is desirable

The mechanism of action of ethyl chloride spray on trigger areas in the muscles is probably different from that of the local infiltration and needling technics It is clear however, that neither one depends on a local anesthetic effect in the ordinary sense of this term Neither can the effect of spraying be due to refrigeration anesthesia of the structures beneath the skin. Care is taken to avoid a degree of cold which produces aching or frosts the skin. Furthermore it can be shown by the intradermal injection of an irritant solution that this method of light spraying which blocks trigger areas does not block pain impulses even from the superficial layers of the skin.

Adjuncts to Local Block.—I want to emphasize that local block is usually not the only therapeutic measure that we employ because even in the apparently simple cases of acute spasm we are apt to find that something has been wrong with the muscles for some time before the acute attack. We use, therefore a system of treatment which combines a variety of measures for the relief of painful muscle spasm

In the first place we limit any form of exercise or work which places a heavy load on the affected muscles This is quite simply accomplished by telling the patient that he must avoid doing anything which produces pain which lasts for more than a second or two after the effort Pain itself is deleterious in that it reflexly builds up more spasm therefore it is unwise to attempt to drive a muscle beyond the point of pain direct the patient to move the part fr such a way as to provide gentle stretc affected muscles at regular intervals stance, if extension at the shoulder is patient may be directed to reach up a marker on the wall every hour Stretch be carried out within the limits of pain so forcibly as to produce a lasting ach stretch We rarely put the patient to often we get him up out of bed

As soon as the acute pain is controll block therapy more vigorous exercise tuted and it is determined by trial an much the patient can do That form o recommended which the patient forme and for which his muscles were previou and developed Swimming is often con best exercise to improve muscular fu one cannot direct a person to swim learned how and expect him to use p tioning muscles properly He may e and if so his muscles will derive much fit from tennis than from another spo he was never accustomed or in which skilled Furthermore, it is our expe free-moving and pleasurable games pr cular relaxation to a much greater d does useful work about a house, such carpentering, and gardening since thes are all based on repetitive movement small range of motion

External heat is helpful especiall baths and hot water bags Intense he diathermy, often seems to intensify Massage is employed only when the i has subsided when trigger areas of taneous activity are present, manip massage of these areas may aggravat On the other hand, when applied a stage, massage is very beneficial.

We usually employ some internal m Ascorbic acid is given routinely to ev receiving local injection therapy as a 1 0 Gm. by mouth daily In case of s we use aspirin in doses up to 4 Gm da occasionally combined with codeine never prescribe morphine for obviou Incidentally the opiates are not nearly in pain due to muscle spasm as they a forms of pain

An effort is made to discover mechan which may have led to the evolution syndrome In particular we try first t chronic strain associated with repeti ments. For instance if episodes of p neck recur in a certified public accou spends hours copying figures out of a b at his side we have him place the book

and curare? Has he another group which receives physiotherapy alone?

Dr Ransohoff The vagaries of the disease are so great that I would not know how to set up a control group to ascertain differences in ultimate outcome due to curare However, our electromyographic studies show that physical therapy alone, hot packs or stretching, for instance, does not accomplish the same results without curare as it does with curare Thus, the therapeutic results are in a sense controlled by electromyography

Dr Wolff We have tried curare in a few patients with spastic states associated with myelitis to relieve spasm, and, indeed, it did relieve it, but the patients were left so weak as the result of this action that it was of doubtful value I wonder whether the margin between relaxation of spastic muscles and weakness of the remaining useful muscles is wide enough for curare to be of any help in this problem

Dr Travell Differences in results may be due to differences in preparations In the chronic spastic states, such as the cerebral palsies, hemiplegias, etc , in which Schlesinger reported satisfactory results, d-tubocurarine in wax and oil was used exclusively He noted that, with aqueous solutions of the curare alkaloids, it was very difficult to secure the relaxing effect without unpleasant side-effects

Dr Gold Dr Ransohoff, would you recommend that a general practitioner use curare or any of its preparations in his office for a patient with a sprained back or dislocated shoulder with a good deal of muscle spasm?

Dr Ransohoff The use of curare is not a satisfactory office procedure One has to be prepared to have the patient lie there for about three hours He won't be able to walk right away

Dr Gold What about a smaller dose?

Dr Ransohoff A smaller dose does not produce the desired effect With aqueous preparations of curare, it is apparently necessary to produce a peak effect which lasts about forty minutes During this time the patient is too dizzy and too diplopic to walk about comfortably

Dr Gold Are we to conclude that one cannot secure some relaxation of muscle spasm by means of curare without making the patient ill and uncomfortable?

Dr Ransohoff That is correct In treating acute shoulder and back pain, we hospitalize the patient and we never use curare alone We always give it in conjunction with physical therapy

Dr Travell I should think that curare, certainly in aqueous solutions, would not be a safe office medication In the hospital, provisions exist for meeting emergencies connected with its use, such as prostigmine for injection and some means for giving artificial respiration

Dr Ransohoff That is true, but it is interesting that in our experience with thousands of injections of aqueous curare, we have given prostigmine as an antidote only two or three times in poliomyelitis, and I am not sure that it was necessary in these

Dr Carlton Hunt It should be kept in mind that the patient with myasthenia gravis is particularly sensitive to curare, so that the usual therapeutic dose may produce marked paresis

Dr Modell Dr Hunt, would you say a few words about the mode of action of curare?

Dr Hunt The smallest effective doses of curare in mammals produce a block at the myoneural junction In experimental animals, relatively huge doses also produce a block at synapses in the sympathetic ganglia and induce central nervous system effects Different muscles of the body exhibit differences in susceptibility to this drug Studies in man have shown that paralysis of muscles innervated by cranial nerves results before any significant paralysis is produced in the somatic musculature of the trunk and limbs and before any significant effect is produced in the electromyograph It should be emphasized that the dose of curare required to cause any appreciable degree of general neuromuscular block is not far below the dose which causes paralysis of the respiratory muscles

Dr Modell How do you think it acts to relieve the pain in poliomyelitis?

Dr Hunt It seems to me most likely that this effect of curare is due to its action at the neuromuscular junction relaxing the spastic muscles Experimental studies show that relatively small doses of curare block neuromuscular transmission of high frequency stimuli more readily than of low frequency stimuli

Dr Travell It seems to me that the relief of pain by small doses of curare in acute anterior poliomyelitis might be the result, at least in part, of the blocking of the sympathetics, which is known to occur in these patients because of the cutaneous vasodilatation in the extremities The fact that very large doses of curare are required to produce a sympathetic block in the normal does not rule out the possibility that this action may play a role under special conditions

Dr Cattell In large doses, curare may have some effect on sympathetic nerve function by its action on the ganglia to block conduction However, it appears more probable that the cutaneous dilatation seen in patients is due to the release of histamine from the tissues, which has been shown to occur experimentally when large doses of curare are given to animals I agree with Dr Hunt that there is a theoretical basis for a greater effect of curare in the presence of muscular spasm In such muscles, impulses are presumably being con-

ducted across the myoneural junction at a relatively rapid rate, and such high frequency stimuli are blocked by a degree of curarization which is without effect on the conduction of single impulses. It, therefore, seems to me very probable that the relief of pain following the administration of curare in Dr Ransohoff's patients was mediated through a reduction in muscle spasm

DR MODELL Dr Hansson how do you treat painful spasm of skeletal muscles?

DR. KRISTIAN G HANSSON In the painful spasm of acute anterior poliomyelitis, application of moist heat is our treatment of choice at the present time We prefer a therapeutic tank with a temperature of 106 F (41.2 C) for one-half hour twice a day This procedure is followed by passive stretching to obtain the normal length of the muscles. Another type of painful spasm occurs in connection with acute traumatic conditions, such as lumbosacral strains sprains, peritendonitis about the shoulder, and so forth In these conditions, applications of heat effleurage manipulation and stretching exercises are of benefit. However, whatever therapeutic means are used to overcome the painful spasm it is most important to follow it up by an attempt to restore the normal muscle length

DR. TRAVELL Is it also your experience that in the extremely painful forms of muscle spasm the application of diathermy may sometimes produce an immediate exacerbation of pain?

DR. HANSSON When painful muscle spasm is associated with an increased blood supply as in the case of congestion, the use of any form of heat, either external or internal, in the form of diathermy or short wave, is indeed often followed by an exacerbation of pain Under these circumstances, the application of cold in the form of ice bags is more rational and may be followed by relief of pain.

DR. MODELL Stretching a muscle in painful spasm sometimes relieves the pain and restores the normal range of motion, but then, at other times stretching does harm Dr Liebolt, would you tell us something about this?

DR. FREDERICK LEE LIEBOLT The active or passive stretching of a muscle in spasm, without anesthesia, is effective in relieving pain and restoring motion in certain conditions, for example that which follows acute subacromial bursitis The act of stretching such muscles gives rise to pain during the procedure but once the spasm is overcome the pain disappears, and the motion becomes normal Passive and actual stretching of muscles which have shortened to the stage of contracture, as may be the case in fractures, bursitis and trauma is most important and will do no harm If the muscle is acutely inflamed however as in acute poliomyelitis repeated active and passive stretchings will prove quite harmful, producing additional irritation and inflammation leading to fibrosis When the stage of fibrosis has been reached, stretching may do more harm than good The atrophied structures have been infiltrated or replaced by fibrous tissue and, here, manipulation without anesthesia will simply stretch this tissue and serve to stimulate additional fibroblastic activity, manipulation, under anesthesia will tear the taut structures produce hemorrhage, and simply traumatize the tissue further

DR. MODELL How do you distinguish between spasm and contracture? What is the difference between spasm and spasticity?

DR LIEBOLT Spasm is an involuntary muscular contraction which may be of short or long duration but which is always temporary, contracture is an involuntary muscular contraction of long duration which unless treated, is always permanent. Although spasm and spasticity are sometimes used as synonymous terms I do not consider them to be the same, because spasm refers to a temporary, protective, and nonpathologic state of muscular contraction without changes in the reflexes, while spasticity refers to a permanent, nonprotective and pathologic state of muscular contraction associated with changes in the reflexes

DR. MODELL Dr Wolff, have you treated any patients with painful muscle spasm by psychotherapy?

DR. WOLFF Muscles do contract as a part of a general state of tension and apprehension in which there is overalertness associated with quick movement and hurry in attempting to get more done than the time or the situation permits The intravenous use of sodium amytal, 0 1 to 0.5 Gm., in a few people who have painful muscles and such a general tension state as I have just mentioned has occasionally, in a dramatic way relaxed the patient and eliminated the pain for variable periods. The long term psychotherapy in people who have muscle contraction as part of their reaction to stress is as difficult as that in patients with any other bodily change associated with life stresses and I would say the results are about as good or as bad

DR. TRAVELL What degree of narcosis was produced in the patients who received sodium amytal? Was it a full anesthetic dose?

DR WOLFF No these patients were able to communicate and speak They were half-asleep and unsteady on their feet at the time They were able to leave the table in about an hour

DR MODELL Would spinal anesthesia or deep ether anesthesia have the same effect in breaking the cycle of painful spasm as the local block measures which you described?

DR TRAVELL These procedures have been used successfully Dr Rovenstine's group at Bellevue is employing regional nerve block which produces temporary muscular relaxation, and they report that permanent relief of pain may follow I see no reason why spinal anesthesia could not be used in the same way, but perhaps it entails more risk There are also reports of patients who were prepared for a disk or fusion operation, and, for some reason, the anesthetic had to be discontinued even before a skin incision was made, but their pain was completely relieved Anesthesia was apparently sufficient to interrupt the vicious cycle permanently

DR WOLFF Intravenous procaine raises the cutaneous pain threshold somewhat Is there ever any indication for that rather than for aspirin by mouth?

DR TRAVELL I have had no experience with it Dr Bobb is here from New York Post-Graduate Hospital, and perhaps she would answer your question

DR AUDRIE L BOBB I have used intravenous procaine in three cases of painful muscle spasm None of these responded favorably The group at Post-Graduate claims that the best results with it are obtained in patients with osteoarthritis, but this yields to so many measures that I am not sure to what these good results are to be ascribed

DR TRAVELL Are you still using intravenous procaine in the type of painful muscle spasm we are considering today?

DR BOBB I have given it up

DR MODELL Could we dispose of some of the other agents listed at the start of the conference?

DR. WOLFF Dr Comroe of the University of Pennsylvania tells me that, after a most careful analysis of the effects of prostigmine in patients with excessive muscular contraction associated with joint disease in some instances, he has not been able to find any evidence that prostigmine is therapeutically useful Have you any?

DR TRAVELL When the reports on the relief of muscle spasm by prostigmine first came out, I used it enthusiastically in a few selected patients with chronic pain of the type I have described The drug was given parenterally for as long as a month or two, and so far as I could see, did not relieve pain in these patients

DR WOLFF How about vitamin E?

DR TRAVELL I listed vitamin E because of its reported use in fibromyositis I don't use it routinely and am not yet convinced that it influences painful spasm of the skeletal muscles

DR MODELL Dr Travell, how about quinine?

DR TRAVELL Quinine is included in this list because of its effect in some cases of nocturnal calf cramps I have seen patients in whom this troublesome phenomenon was perfectly controlled by the continued administration of 10 grains of quinine sulfate at bedtime Whenever the medication was stopped, the cramps recurred It isn't always effective, and the largest tolerated doses may fail in cases that are indistinguishable from those in which it succeeds

DR WOLFF When I have used it, the side-effects of the quinine have been so disagreeable that the patients did not like it In myotonia congenita, the patient prefers the moderate cramps to the effects of quinine I never tried it in the more painful states

DR MODELL What would you say about nicotinic acid?

DR GOLD For what purpose? For the histamine-like, capillary dilator action to improve the circulation in muscle?

DR TRAVELL Yes, I have used it in a few cases in fairly large amounts by mouth, up to a gram a day, and have not been impressed with the results

DR MODELL Why is ammonium chloride included in the list?

DR TRAVELL In the occasional case, dramatic relief of pain is secured by the oral administration of ammonium chloride, 0 5 to 1 0 Gm three times a day The mechanism is unknown, but it might depend on the production of a diuresis and withdrawal of fluid from the muscles

DR MODELL In acute coronary thrombosis, pain is sometimes unrelieved by morphine You mentioned that local block might be effective under these circumstances When should this form of treatment be applied?

DR TRAVELL We apply it whenever the agonizing pain of acute coronary thrombosis does not subside spontaneously If trigger areas can be found in the parasternal or precordial regions, the injection of one or two of these tender points may terminate the pain at once so that no further analgesic medication is needed Just spraying the chest with ethyl chloride will sometimes accomplish the same result

DR MODELL How long would you wait before you institute that treatment?

DR TRAVELL I would not wait at all The minute I saw such a patient I would spray the chest with ethyl chloride We have three cases in which the pain stopped at once and did not return

DR MODELL What part of the chest was sprayed?

DR TRAVELL The front of the chest, especially the sternal and parasternal regions, and the precordium Special attention was paid to discrete localized areas of deep tenderness

Summary

DR GOLD The conference this afternoon dealt

ie of the very common problems encoun- practically every branch of clinical medi umely, the painful spasm of skeletal mus- While painful spasm may occur in practi- l muscles of the skeletal system, there are groups especially prone to become so in- and these fall into certain fairly well-de- ain syndromes, known by a variety of such as lumbago, the frozen shoulder, and

Acute spasm in certain muscles, such as a severe cramp in the calf which may awak tient out of a sound sleep may cause pain over the area of the knotted muscle mass the other hand many of the cases present ıbtle problems in that the pain is referred ırea distant from the site of the abnormal

In order to control these it is imperative to the abnormal muscle giving rise to the d pain, and in this connection it was l out that every muscle of the body has a pattern and area of reference which directs the muscle in spasm. This muscle is identi the fact that it possesses areas of deep ten s, it shows a localized contraction when it sed, and it causes pain when it is stretched ypersensitive spots within these muscles, l trigger areas, give rise to pain in the refer ones, when they are stimulated by pressure tretching or needling

r well-defined technics were described for ating painful spasm in skeletal muscles so-called local block methods, (2) stretch- muscles with or without general anesthesia arization and (4) moist heat in the form of bs It was pointed out that these are not lly exclusive, and it was emphasized that onal measures are often imperative in order ure the best immediate results as well as asting relief in problems of painful spasm. ite anterior poliomyelitis, the use of curare ly relieves the muscle pain but affords an unity for appropriate stretching of the d muscles so as to prevent chronic shorten- d deformities. Some cases require salicyl and codeine as supplementary agents pts are made to reach such underlying as trauma, chilling of the body chronic lar strain resulting from hurry repetitive nents poor posture, and incorrect furniture , impaired circulation as in anemia and ittent claudication low basal metabolic rate tension and anxiety states which might yield to psychotherapy, chronic infection, and mechanical compression of nerve structures There seems to be some experience indicating that certain vitamins might have a place in these conditions, such as ascorbic acid, nicotinic acid, and vitamin E and intravenous procaine injections have been tried

While all of these systemic approaches and attempts at the control of underlying causes are of great importance, there remains the fact that in a large proportion of cases underlying organic disease cannot be found, cannot be corrected, or does not exist, and the further fact that the most spectacular advance in the control of these painful and crippling skeletal muscle states has been made in the attempts at local relief of the spasm within the muscle itself The so-called local block technics received special attention, for these are accessible to the general practitioner for use in a wide variety of cases which he encounters in his office practice and in the hospital Their utility is based on the notion that in many of these painful spasms a self-sustaining cycle of spasm–pain–spasm persisting long after the precipitating cause has vanished may be permanently abolished by an interruption of a reflex mechanism Of the two technics, the successful infiltration of trigger areas in muscle requires considerable experience in the matter of localization The successful application of ethyl chloride spray would seem to require less skill and may well lend itself to use by the intelligent patient himself Here then are simple forms of treatment wherein a patient limping with a sprained ankle may walk off freely following a few sprayings with ethyl chloride, or a patient barely able to put on his coat because of an excruciatingly painful frozen shoulder may be able to swing his arm about freely following a few skillfully placed injections of procaine or a few sprayings with ethyl chloride, or a patient with acute coronary thrombosis and thoracic pain which does not yield well to morphine experiences prompt relief after a few applications of the ethyl chloride spray Clearly not all cases respond and in many the response is slow incomplete and only temporary but there are those in whom these simple measures provide relief from pain and disability in a manner as dramatic as any experience one is likely to encounter in therapeutics.

FORTY-SECOND ANNUAL MEETINGS

of the

DISTRICT BRANCHES

of the

MEDICAL SOCIETY OF THE STATE OF NEW YORK

PROGRAMS

Sixth District Branch

Wednesday, October 6, 1948
Hotel Arlington
Binghamton, New York

Afternoon Session

2 30 P M —"Carcinoma of the Colon and Rectum Diagnosis and Treatment" (Lantern slides)
Henry B Sutton, M D, F A C S, Ithaca, attending surgeon, Tompkins County Memorial Hospital and Cornell University Infirmary and Clinic
John W Hirshfeld, M D, F A C S, Ithaca, visiting surgeon and research associate, Cornell University Infirmary, formerly associate professor of surgery, Wayne University College of Medicine

3 30 P M —"Management of Hypertension"
James Bordley, III, M D, F A C P, physician-in-chief and director, Mary Imogene Bassett Hospital, Cooperstown, formerly associate professor of medicine, Johns Hopkins University, School of Medicine

4 30 P M —"Prepayment Medical Plans"—Round-table discussion
Moderator Mr George P Farrell, director, Bureau of Medical Care Insurance, Medical Society of the State of New York
"Why Doctor Participation Is Necessary for the Success of a Medical Care Plan"
Carlton E Wertz, M D, chairman, Council Committee on Economics, Medical Society of the State of New York
"How the Central New York Medical Plan Serves the Doctor and the Public"
Leo E Gibson, M D, president, Central New York Medical Plan
"Why Medical and Surgical Care of Utica Has the Largest Member Participation of Any Plan in the State in Relation to Blue Cross Subscribers"
John F Kelley, M D, vice-president, Medical and Surgical Care, Inc

Evening Session

7 00 P M —Dinner
Introduction of officers of the Medical Society of the State of New York
Address by the President, Leo F Simpson, M D, Rochester
Remarks by Mrs Edgar M Neptune, president of the Woman's Auxiliary to the Medical Society of the State of New York

8 30 P M —"Diabetes Today"
Priscilla White, M D, F A C P, associate of Dr Elliott Joslin at New England Deaconess Hospital, Boston

Ladies will join the members of the Sixth District Branch for dinner

Officers—Sixth District Branch

President Binghamton	Charles L. Pope M D,
First Vice-President Norwich	Norman C Lyster M D
Second Vice-President Binghamton	Elton R. Dickson M D,
Secretary Montour Falls	Paul F Willworth, M.D,
Treasurer Oneonta	Marshall Latcher M D,

Presidents of Component County Societies

Broome	Jacob C Zillhardt, M D Binghamton
Chemung	Arthur C Glover M D, Elmira
Chenango	John A Hollis, M D Norwich
Cortland	Robert H Kerr M D, Cortland
Delaware	Charles K Ives M D, Roxbury
Otsego	Edward J Keegan M D Oneonta
Schuyler	Francis C Ward M D Odessa
Tioga	Arthur J Capron, M D Owego
Tompkins	Henry W Ferris, M D Ithaca

Seventh District Branch

Thursday September 30 1948
Veterans Administration Facility
Canandaigua, New York

Morning Session

9 30 A.M.—Motion pictures, Abdominal Total Hysterectomy and Perineorrhaphy' and 'Subtotal Gastrectomy for Gastric Ulcer'

"A Practical Consideration of Commoner Endocrinological Problems Encountered in General Medicine

Ivan Heklman, M D associate professor of medicine University of Buffalo School of Medicine, assistant attending physician, Buffalo General Hospital

Recent Advances in the Treatment of Arthritis

L. Maxwell Lockie, M.D professor of therapeutics, University of Buffalo School of Medicine

"The Council of Rochester Regional Hospitals A Review of Its Two Years' Experience

Paul A. Lembcke M D associate director

1 00 P.M.—Luncheon

Introduction of Officers of the Medical Society of the State of New York

Address by the President, Leo F Simpson M.D Rochester

Remarks by Mrs Edgar M. Neptune president of the Woman's Auxiliary to the Medical Society of the State of New York

Afternoon Session

2 00 P M — Water Balance in Acute and Chronic Disease

Maurice Bruger, M.D associate clinical professor of medicine and chief division of pathological chemistry, New York Post-Graduate Medical School and Hospital Columbia University

"The Use of Anticoagulants in the Prevention and Treatment of Thrombo-embolic Complications of Coronary Occlusion with Myocardial Infarction

Charles D Marple, M D New York City research fellow in medicine, Cornell University Medical College

Ladies will join the members of the Seventh District Branch for dinner

The Executive Committee of the Seventh District Branch will donate a prize of $25 to that Woman's Auxiliary (except Ontario) from which county there is the largest percentage of physicians registered at this meeting.

Officers—Seventh District Branch

President Hornell	Kenneth T Rowe M D,
First Vice-President Rochester	George H Gage M D.,
Second Vice-President Clifton Springs	Samuel A Munford M D
Secretary Penn Yan	Glenn C Hatch, M.D.,
Treasurer Hornell	James J Yanick, M D

Presidents of Component County Societies

Cayuga	Charles T Yarington M D., Moravia
Livingston	Foster J Hamilton, M D Hemlock
Monroe	Ellis B Soble M D Rochester
Ontario	Leon A. Stetson, M.D Canandaigua
Seneca	Charles M Smith M D Waterloo
Steuben	Vrooman S Higby M D Bath
Wayne	James H Arseneau, M D Lyons
Yates	Ralph H. Davis, M D Penn Yan

NECROLOGY

Nathan Bernard Bluestone, M D, forty-four, of Yorktown Heights, died on August 25 Dr Bluestone was graduated from the University of Glasgow in 1933 A former lieutenant colonel in the Army, he had served in Europe with the Medical Corps during World War II Dr Bluestone was an associate physician on the staff of Peekskill Hospital and also served on the staff of Northern Westchester Hospital in Mt Kisco and Bellevue Hospital, New York City Dr Bluestone was a member of the American Medical Association and the New York State and Westchester County Medical Societies

Heywood Hill Hopkins, M D, of Rochester, died on May 13 at the age of fifty-two Dr Hill received his medical degree from Harvard Medical School in 1922 and subsequently studied at New York Hospital under Dr Eugene Pool and in Vienna and Paris He settled in Rochester in 1927 where he established his practice, specializing in orthopedic surgery He was associated with the staffs of Genesee Hospital, Monroe County Infirmary, and Strong Memorial Hospital He also served as consultant in orthopedic surgery for Bath Memorial Hospital and Tompkins Memorial Hospital, Ithaca Dr Hill was a member of the Rochester Academy of Medicine, the Rochester Pathological Society, the New York State and Monroe County Medical Societies, the American Academy of Orthopedics, and the American Medical Association

I. Julius Martinson, M D, died in his home in New York City on August 24 He was seventy-five years old Dr Martinson was graduated from the University of Dorpat in 1898 and had been a practicing physician in New York since that time He was a member of the American Medical Association and the New York State and County Medical Societies

Bernard Joseph Mulcahy, M D, Poughkeepsie, died at his home on August 21 at the age of thirty-five Dr Mulcahy, an eye, ear, nose, and throat specialist, was a graduate of the University of Vermont College of Medicine in 1937 He served his internship at Vassar Brothers Hospital, Poughkeepsie, where he served as clinical assistant in ophthalmology and otolaryngology at the time of his death He also served as assistant physician in ophthalmology and otolaryngology at St Francis Hospital, Poughkeepsie Dr Mulcahy was a flight surgeon with the Army Air Corps during World War II and spent two of his four years in the armed services in the European Theater He was a member of the American Medical Association and the New York State and Dutchess County Medical Societies

Charles Pines, M D, of the Bronx, died on August 21 at the age of sixty-five Dr Pines was graduated from New York University and Bellevue Hospital in 1911 Dr Pines had served on the staff of Bellevue Hospital for over thirty-five years and at the time of his death was an assistant professor there He was an assistant physician in dermatology and syphilology at this hospital, as well as on the staff of Goldwater Memorial Hospital, New York City Dr Pines was a member of the American Medical Association, the Bronx Pathological Society, and the New York State and Bronx County Medical Societies

Hanford Waterfield, M D, of New York City, died August 18 He was fifty-two Dr Waterfield was graduated from the College of Physicians and Surgeons, Columbia University, in 1933, and interned at Fifth Avenue Hospital A veteran of World War I, he had served on the medical staff of Kings Park State Hospital, Kings Park, Long Island, and for a long time practiced in Hempstead Dr Waterfield had been appointed senior assistant in Lenox Hill Hospital's neuropsychiatric clinic on June 1 and last month was also named assistant psychiatrist at the Vanderbilt Clinic in the Columbia-Presbyterian Medical Center He had previously served on the psychiatric staffs of New York Post-Graduate Hospital and the Payne-Whitney Clinic in the New York Hospital-Cornell University Medical Center Dr Waterfield was a member of the American Medical Association, the American Psychiatric Association, the Long Island Psychiatric Society, and the New York State and County Medical Societies

COUNTERACT BARBITURATES

People who take overdoses of the barbiturate sleeping medicines, either by accident or with suicidal intent, may in future be saved by having a kind of tourniquet put around the middle of the chest to constrict it This possibility appears in a report by Drs Augustus C P Bakos and William L Howell of Georgetown University School of Medicine in the journal, *Science*, July 9

The barbiturate sleeping medicines affect the breathing center in the brain When a poisonously large dose has been taken, breathing goes on only through reflex drives But at this stage, the rate of breathing in dogs can be increased by compression of the chest, the Georgetown scientists found The compression was done with the kind of cuff doctors use in taking blood pressure This seemed to elicit and maintain a reflex from the lungs which kept the animals breathing even when the breathing center in their brains had been deadened by the drug

Preliminary observations, the scientists report, show that the maneuver may be effective in cases of barbiturate poisoning, although not enough data have been obtained to be sure —*Science News Letter, July 24, 1948*

HOSPITAL NEWS

Medical Center Sends Specialists Abroad

IN KEEPING with its policy of promoting the exchange of knowledge and experience with medical men of foreign countries, Columbia Presbyterian Medical Center has just sent five specialists abroad On the list of subjects to be discussed with the doctors of over a dozen foreign countries are obstetrics plastic surgery, diseases of the ear nose, and throat, immunochemistry and cancer

In the past, on similar trips Medical Center doctors have carried important American medical 'know how' abroad and have in turn brought back the latest findings as to new drugs and methods of treatment. On such a trip in 1930 to England, Dr John Lockwood, attending surgeon brought back the first news of the modern sulfa drugs.

Dr Howard C Taylor, Jr director of obstetrics and gynecology of the Presbyterian Hospital and professor of obstetrics and gynecology of Columbia s faculty of medicine left this country in July with a group of Unitarian Service Committee doctors for exchange of medical information and experience in Germany Dr Taylor's plans include clinical work in Frankfurt, Berlin Göttingen, Munich, Tuebingen Freiburg and Heidelberg

Dr Edmund P Fowler Jr director of the otolaryngology service of the Presbyterian Hospital and professor of otolaryngology of Columbia University's faculty of medicine, has flown to Oslo Norway From Oslo Dr Fowler goes to Copenhagen to present a paper before the Collegium Otolaryngologicum an international "ear nose and throat' group Following this he plans a trip to Stockholm for an informal meeting with other doctors on the subject of impaired hearing

Dr Jerome P Webster attending surgeon of Presbyterian Hospital and professor of clinical surgery of Columbia's faculty of medicine has left for Shanghai China to inaugurate a program to develop the teaching of plastic surgery in that country The program is under the joint sponsorship of the American Bureau for Medical Aid to China and the Commission on Medical Education of China s Ministry of Education Beginning the program on October 1 Dr Webster will give an eight weeks' course in plastic surgery at Shanghai's Chungshan Hospital The course will be attended by surgeons from teaching faculties of all Chinese medical colleges On his arrival in China in September Dr Webster will deliver lectures on his specialty in Peking Canton, and Nanking. Dr Webster is vice-president and a director of the American Bureau for Medical Aid to China.

Dr Michael Heidelberger chemist of the Presbyterian Hospital and professor of biochemistry of Columbia University's faculty of medicine, sails soon for France and Switzerland While abroad, he will attend the Eighth Congress of Biological Chemistry in Paris and will act as a delegate from the American Association for the United Nations to the World Federation of United Nations Associations in Geneva. Professor Heidelberger will also give lectures on biochemistry and allied subjects in various cities in France and Switzerland

Dr Henry T Randall assistant resident in surgery Presbyterian Hospital, will visit cancer research centers in London, Edinburgh, Stockholm Paris and other cities. The purpose of his trip is to investigate and report on the latest trends in cancer research and treatment in those centers

Psychiatric Service Recommended as a Vital Part of General Hospital Care

LEADERS in the field of mental health have for many years recommended the establishment of a psychiatric service as a vital part of any well-rounded medical program in general hospitals. The Hospital Council of Greater New York, recognizing the importance of this objective, incorporated such a recommendation in its master plan for hospitals and related facilities, according to a recent report in its *Bulletin*

The general hospital is the logical place in which to advance the cause of psychiatry in the treatment of many physical ills that are aggravated by mental disturbances as well as to treat purely psychiatric patients, the Council pointed out.

Frequently when the inclusion of psychiatry in the general hospital is discussed one is left with the impression that a separate unit for the sole treatment of psychiatric patients is the first requirement. Good psychiatric service for general medical and surgical patients may be attained without the establishment of a separate unit.

From the prevention standpoint this is an important factor Dr Franklin G Ebaugh in a monograph prepared for the American Hospital Association, points to the tremendous increase in chronic psychiatric cases and declares "It is highly possible that had many of these been offered general hospital psychiatric care at an early state of their illness and not been neglected they would never have reached this state

He further points out that, in spite of the fact that relatively few general hospitals have made provision for the care of nervous and mental patients, 'Every general hospital admits psychiatric patients without knowing it and they are usually treated without any consideration for the psychiatric issues.'

There are certain advantages of a separate psychiatric unit for the treatment of early psychiatric conditions in the general hospital From the patient s point of view there is a great stigma in becoming a patient in a mental disease institution The general hospital implies no such stigma, irrespective of the illness.

Treating the psychiatric patient in the general hospital is also a very real advantage to the community in both a social and an economic sense By early treatment of psychiatric disorders many border line patients will be prevented from being committed to publicly supported mental institutions thus effecting tremendous savings in tax dollars

While the development of a psychiatric unit in the general hospital is an important factor in the integration of psychiatry into general medicine, it should be pointed out that a psychiatric service can be instituted without necessarily setting up a separate physical unit for psychiatric patients only

In these days when hospitals are under scrutiny by the community, and when the need for psychiatric treatment is acute, and too often unavailable, a combination of psychiatric and other medical forces would do much to bring about greater public understanding Furthermore, it would come nearer to giving the community what it wants and expects from its general hospitals—centers of medical care where the average citizen can get good medical and hospital service, irrespective of his illness

Grants Awarded by Multiple Sclerosis Society

THE National Multiple Sclerosis Society has announced that it made grants totaling $77,600 to five medical institutions to conduct medical research into the causes and control of multiple sclerosis

Ralph I Straus, president of the society, said that the allocation for the new research projects was voted by the society's board of directors Included in the grants was a fund to establish the second multiple sclerosis research clinic to be financed by the society, at the Albany Hospital, Albany

Neurologists of the Albany Medical College will cooperate with the Division of Research and Laboratories of the New York State Department of Health in conducting the research program at the clinic

The largest of the grants went to Tulane University School of Medicine, New Orleans Other institutions receiving aid were the Massachusetts General Hospital, Boston, Cedars of Lebanon Hospital, Los Angeles, and the New York University School of Medicine

American College of Surgeons to Hold Hospital Conference in Los Angeles

THE twenty-seventh annual Hospital Standardization Conference will be held at the Biltmore Hotel, Los Angeles, from October 18 to 22, in conjunction with the thirty-fourth annual Clinical Congress of the American College of Surgeons, according to an announcement by Dr Malcolm T MacEachern, associate director and chairman of the Administrative Board

A galaxy of hospital authorities from all parts of the United States and Canada will participate as speakers and discussion leaders in the five-day program. The last day of the conference, Friday, October 22, will be devoted to study tours of hospitals in Los Angeles and vicinity with the cooperation of the Southern California Hospital Council, of which Paul C Elliott, superintendent, Hollywood Presbyterian Hospital, is president The chairman of the committee which is assisting Dr MacEachern in planning the twelve sessions of the Hospital Conference at the hotel is Ritz E Heerman of Los Angeles, superintendent of the California Hospital

Among the other well-known speakers will be Rev John J Flanagan, S J , St Louis, executive director of the Catholic Hospital Association, James A Hamilton, Minneapolis, professor of hospital administration, University of Minnesota, Horace Turner, Spokane, administrator, Deaconess Hospital, and president of the Association of Western Hospitals, Dr Herman Smith, Chicago, hospital consultant, Dr Curtis H Lohr, Clayton, Missouri, superintendent and medical director, St Louis County Hospital, Kenneth Williamson, Chicago, assistant director, American Hospital Association, Dr G Otis Whitecotton, Oakland, medical director, Highland-Alameda County Hospital, Paul H Fesler, Oklahoma City, administrator, University Hospitals, Dr Frank R Bradley, St Louis, director, Barnes Hospital, and professor of hospital administration, Washington University, Dr Joseph Clemmons, New York, medical director, Roosevelt Hospital, and Dr Anthony J J Rourke, San Francisco, director, Lane and Stanford University Hospitals

Physicians and surgeons, trustees, nursing directors and educators, medical record librarians, and many of the other professions represented in the hospital, will also address the sessions "Newer Developments in Medical Science and How They Affect Hospital Administrative Practices" will be discussed from the standpoints of surgery, medicine, pathology, and nursing The "Trend of Hospitals to Supply Facilities and Services for Members of the Medical Staff" will be presented from three angles use of a staff office, use of a doctors' professional building connected with the hospital, and use of one floor of the hospital for doctors to see patients

A symposium on "Current Medico-Administrative Advances in Hospitals" will include a talk on "Hospitals and Anesthetists" by Dr Henry K Beecher, Boston, anesthetist-in-chief, Massachusetts General Hospital Other meetings include a joint session with the American Association of Medical Record Librarians, a joint session for hospital trustees, physicians, and administrators, a round table conference on problems of the small hospital in maintaining acceptable standards, a public relations breakfast conference, a forum on trends in hospital administration, and a panel discussion on "Nursing the Patient," at which the first speaker will be Pearl McIver of Washington, president, American Nurses' Association, and director of Public Health Nursing, U S Public Health Service

Regulations Given for Hospitals Participating in Federal Program

IN A letter sent to all voluntary hospitals in New York City the Hospital Council of Greater New York stated that all applications which are to be considered for funds allocated during the first two years of the State Hospital Plan should be forwarded to the Hospital Council not later than September 30 1948

It was explained that 'the State Hospital Survey and Planning Commission is most anxious to set up its program for the first two years of construction at an early date The State regulation provides for a period of sixty days after solicitation of sponsors, for filing of application for current funds

The Hospital Council as the official agent for the State Commission pointed out that only Part I of the application is required by that date Part I the Council continued, is a preliminary request and does not require detailed plans of the project. Projects which are not advanced to that stage will be considered for subsequent years' allocations.'

'The first two years funds,' the Council went on to say cover the period beginning July 1 1947 and ending June 30 1949 The contract (Part IV completed) for projects utilizing funds for the first year of the program must be awarded by June 30, 1949 and those for the second year of construction by June 30 1950 Ample time is therefore allowed for the completion of detailed plans"

The letter stated that "all of the projects in New York City will be considered as special projects, since the law was primarily enacted to help rural areas The Council has considered the need for facilities for premature infants as most needed throughout the City also that general care beds are most urgently needed in the Borough of Queens. These two types of facilities have been given a high priority by the Council, and the State has indicated that a fair proportion of the funds might be available for such projects

It was pointed out that special projects which incorporate facilities for long term illness, mental disease, tuberculosis, or communicable diseases into the general hospital will receive special consideration although the available funds are exceedingly limited'

The letter informed the voluntary hospitals that the staff of the Hospital Council will be available to assist them in this matter

Births in Hospitals Increase in Eleven Years

THE United States Public Health Service reported in August that tremendous progress has been made in the last eleven years toward improving the conditions under which American babies are born

The agency reached that conclusion by comparing vital statistics for 1946 the most recent year for which a complete report is available and 1935 the first year in which full figures were kept. During the eleven-year period the percentage of babies delivered in hospitals more than doubled The number of births not attended by physicians dwindled just as sharply

In 1946 82 4 per cent of all live births occurred in hospitals In 1935 the proportion was 30 9 per cent. The number of deliveries attended by physicians outside of hospitals was 12.2 per cent of the total in 1936 50 6 per cent in 1935

Only 5 4 per cent of the 1946 births were attended by midwives or other nonphysicians. In 1935 12.5 per cent of America s babies arrived without a doctor's aid

Blue Cross Plan Adds 964,926 New Members

BLUE Cross hospital service plans now have an enrollment of 81 210 819 in the United States and Canada. A growth of 964 926 new members in the second quarter of 1948, the Blue Cross Commission of the American Hospital Association announced in August

Associated Hospital Service, New York led all other plans with a second-quarter growth of 131,286 new members. Michigan Hospital Service Detroit was second with 68 312 new members, and Connecticut Hospital Service Inc. New Haven, was third with 62 868

Rhode Island leads all states in participation on a percentage basis with 68 per cent of its population enrolled

Of the total membership 29,010,080 participants are in the United States (including Puerto Rico) and 2 194 739 in Canada

NEWS NOTES

Establishment of a medical center to provide free treatment for 30 000 employes of 150 New York City hotels has been announced by the Hotel Association of New York City and the New York Hotel Trades Council

Otsego County needs more than twice its present total of hospital beds Dr John J Bourke Albany executive director of the State Joint Hospital Survey and Planning Commission told medical and hospital leaders in Oneonta at a July open forum meeting

Dr Bourke said his visit was to remind county residents of their opportunity for Federal and State aid in establishing a coordinated program for improving public health work, and providing better medical service and hospital care He said Fox Hospital Oneonta and Bassett Hospital, Cooperstown, have a

total of 157 general beds, whereas the county needs 360—280 general beds and 80 for chronic disease patients

The group in attendance voted to push the matter by expanding a joint committee of Otsego County Medical Association and Otsego County Tuberculosis and Public Health Association

United Hospital, Mamaroneck, has arranged to install entirely new and up-to-date heat-pressure sterilizing units throughout the institution, according to an announcement today by Superintendent Richard C Leavitt This development is part of the hospital's rehabilitation program and follows closely the re-equipping of the x-ray department and the perfecting of the pathology laboratory

Plans are being made for the establishment of a school for handicapped children at Bowne Memorial Hospital, Poughkeepsie, according to an announcement by Dr James E McCambridge, president of the board of education The school was recommended by the Dutchess County Medical Society

•

Albany Hospital, Albany, has been established as the site of a new research clinic for the investigation of causes and controls of multiple sclerosis The new clinic, opened in August, will operate from 9:00 A M until noon every Monday

A new wing is being added to Westfield Memorial Hospital, Westfield, this fall It is to be fireproof and consists of a basement and one story

•

An expansion program that will boost the capacity of Wilson Memorial Hospital, Johnson City, to about 480 beds will begin in September, according to a recent announcement from the hospital

Among other points involved in the expansion, the addition to the east wing will provide space for the construction of new and larger kitchen facilities in the basement, permit major expansion of the hospital's outpatient department now housed in the southern portion of the wing's ground floor, permit the hospital to comply with recent orders of the State Health Department affecting nursery facilities The maternity ward now on the wing's fourth floor will be expanded substantially and will provide for a much larger pediatric division on the fifth floor of the structure

Details of the program, which has been under study by hospital officials for several years, were announced by Robert L Eckelberger, hospital administrator

•

Lourdes Hospital, Binghamton, is planning to install a department of cardiology that will greatly increase the institution's facilities for combating heart disease, according to a recent announcement by Dr Ralph J McMahon, chief of staff

• •

Members of the medical profession are invited to attend the departmental conferences and demonstrations to be held at Mount Sinai Hospital, New York City, during September Those scheduled are Neuropathic demonstrations, 9 30 A M, September 20, Dr Oppenheimer's urologic grand rounds 9 10 A M, September 21, Dr Garlock's surgical grand rounds, 9 00 A M, September 23, pediatric conference, 9 30 A.M, September 23, oral surgical and pathologic conference 4 00 P M, September 24, neuropathic demonstrations, 9 30 A M, September 27, Dr Oppenheimer's urologic grand rounds, 9 10 A.M, September 28, siminar on medical history, 8 30 P M, September 28, Dr Garlock's surgical grand rounds, 9 00 A M, September 30, pediatric conference, 9 30 A M, September 30, medical and surgical conference, 10 30 A M, September 30

The Brooklyn Jewish Home for Convalescents, Far Rockaway, Queens, received its first patients in August The 100-bed institution, designed to serve the entire city, will be open only to men and women without means Applications have been received in large numbers from individuals, hospitals, physicians, and social work agencies in behalf of patients in need of rest, fresh air, and nursing care The applications should be made to the home's Brooklyn headquarters at 130 Clinton Street Latest advances and equipment for handling postoperative and convalescent patients are provided in the building, for which formal dedication exercises will be held some time in September

PERSONALITIES

Appointed

Dr Martin R Steinberg, formerly on the faculty of the Graduate School of Medicine, University of Pennsylvania, and since 1945 assistant director of Mount Sinai Hospital, as director of the hospital, succeeding Dr Joseph Turner, director of Mount Sinai since 1928, who has been named consultant to the board of trustees As full-time radiologist at Wyoming County Community Hospital, Warsaw, Dr Melvin S Martin, radiologist at Binghamton City Hospital since May, 1947 Earle H Daniel, formerly prosthetic specialist for the medical rehabilitation division of the Veterans Administration, Washington, D C, as chief of the prosthetic service, Institute of Rehabilitation, New York University-Bellevue Medical Center

As officers of the medical board of Southampton Hospital president, Dr John H Nugent, Southampton, vice-president, Dr Victor K Young, Riverhead, secretary, Dr Emma Bellows, Southampton, chief of surgery, Dr David H Hallock, Southampton, chief of medicine, Dr LeRoy B Davis, Westhampton Beach, chief of obstetrics, Dr S R Jagger, Westhampton Beach

MEDICAL NEWS

Tuberculosis Group Enlists Foreign Language Press

DR. KENDALL EMERSON, president of the New York Tuberculosis and Health Association New York City has announced the formation of a Foreign Language Press Committee to aid the Association in its health education and public relations program The new group believed to be the first of its kind in the country organized to assist a health organization on a permanent basis will be headed by Sigmund Gottlober director of the American Foreign Language Press

"Foreign language newspapers published in New York have an aggregate circulation of close to a million Dr Emerson said, and it has been felt for some time that this important group of publications should be enlisted in the campaign to eradicate tuberculosis and to make New York generally a healthier city in which to live

In addition to Mr Gottlober as chairman and Dr Herbert R. Edwards executive director of the New York Tuberculosis and Health Association, and Frederick Hodgson public relations director, as ex-officio members, the new committee will include as members Dr Charles Foeldy of the Amerikai Magyar Nepszava Andrew J Valuchek, of the New Yorksky Denník Mark Weinbaum, Novoye Russkoye Slovo George Generalis, Greek National Herald, Julio Carzon La Prensa, Dr Richard Van Dyck, Aufbau and Mrs. Kathe Vordtriede Staats Zeitung

The committee, Dr Emerson said, will be a continuing body and will not only function in fund raising but will carry on year round work on behalf of health education tuberculosis case-finding, rehabilitation and other projects

Extension Courses for Army Nurses

THE Army Nurse Corps has announced that in connection with its expanded educational program, extension courses are now available to Reserve nurses, covering a variety of topics in military orientation and hospital administration

At the Medical Field Service School, Fort Sam Houston, Texas, Major Margaret E Harper and Captain Ruth M Stolts have been assigned to prepare subcourses to the extension series which are especially designed to appeal to nurses and to fit their professional needs These are now ready

The Army Nurse Corps is currently urging all Reserve nurses to investigate the subject possibilities of the various subcourses and to apply without delay Especially recommended are those available in military orientation

Interested Reserve nurses should address inquiries to the Director Medical Field Service School Brooke Army Medical Center Ft. Sam Houston Texas or to the Unit Instructor Organized Reserve Corps, in their area for information about these courses

Funds Made Available for Scientific Research on Alcoholism

THE third grant made this year for research on the problems of alcoholism by the Research Council on Problems of Alcohol has been made public by Joseph Hirsh acting director of the Council He announced that the grant of almost $5 000 was being made available to the Chicago Committee on Alcoholism for the conduct of research work in one of the leading institutions in Chicago Announcement of the exact location and nature of the research project to be undertaken will be made at a later date by Dr A J Carlson, professor emeritus of physiology University of Chicago and president of the Research Council on Problems of Alcohol.

The funds for this research project were part of a larger sum underwritten this past winter and spring by the citizens of Chicago for research throughout the nation. This was the first public fund raising campaign to support research in this field

Mr Hirsh reported that previous grants this year for investigation into the problems of alcohol and compulsive drinking made by the Research Council were to the Cornell University Medical College of the New York Hospital, $30 000 underwriting the second year of a five-year project, and $20 000 to New York University College of Medicine-Bellevue Hospital

Childhood Diseases Take Fewer Lives in New York State

A DROP in deaths caused by childhood diseases was balanced in the State during the first six months of 1948 by a rise in deaths caused by afflictions of middle and old age the State Health Department has reported.

The department announced that the death rate of 11 6 for each 1,000 population was approximately the same as that recorded for the same half year of 1947 But many individual variations showed up

Now high mortality levels were set the department reported in heart disease with a mortality of 458 3 for each 100 000 cancer, with a rate of 180 cirrhosis of the liver 17 6 and diabetes, 45 1

Balancing these were new lows recorded for whooping cough cause of 22 fatalities in the State, streptococcal sore throat cause of 14 deaths and diarrhea and enteritis, which killed 134 children under two years old, but set a new low death rate of 0.5 for each 1 000 children.

National Drive Begun to Spur V D Education

A NATION-wide educational drive to wipe out syphilis and gonorrhea by persuading the public to take blood tests and physical examinations was started in August by the United States Public Health Service

Latest public health estimates are that between 175,000 and 200,000 persons contact syphilis annually and that about five times that number become infected with gonorrhea In the United States at present, it was said, 3,000,000 persons are suffering from syphilis in some stage

Dr Leonard A Scheele, Surgeon General of the United States Public Health Service, in a press conference in New York City, disclosed that a series of fourteen radio transcriptions have been prepared for free distribution to radio stations throughout the United States

The transcriptions were prepared by the Columbia University radio program bureau for the Public Health Service Among the points emphasized by Dr Scheele and physicians associated with him in the Public Health Service were

That in most cases syphilis can be cured in eleven days, during which time the patient may continue his regular work, and that gonorrhea can often be cleared up by a single injection Before the development of penicillin, treatment of syphilis took about eighteen months and as a result only 20 per cent of the persons being treated completed the full course of treatments

The radio programs emphasize the danger to the community, individuals, and even to unborn children when venereal diseases are not treated

Participating in the press conference with Dr Scheele were Dr E Gurney Clark, professor of epidemiology, school of public health, Columbia University, Dr Theodore Bauer, in charge of the venereal disease section of the Public Health Service, and Dr C L Williams, chief of the Bureau of State Service of the Public Health Service

Officer Rank Open in ORC to Experts

CIVILIANS, possessing either professional or technical qualifications which are critically essential and immediately adaptable to the needs of the Army, may get direct appointments in the Officers' Reserve Corps, according to a new policy outlined in August by the Department of the Army

Commissioning of specialists is intended to provide a continuing source of officers experienced in fields in which it is not feasible or economical for the Army to give training The establishment of standards under the new policy now opens the way for those who previously applied for direct commission in specialist fields to resubmit their applications

Such specialties as medical and allied sciences, artwork, dietetics, dramatics, laundry and dry cleaning, various branches of engineering, motion picture production, printing, and submarine diving are included in a list of 75 varied fields

Men, as well as women, who may be commissioned under the program, will bring to the Army the value of their civilian training and will subsequently gain a knowledge of military procedures Individuals, without prior military service, will be required to meet, within a reasonable length of time, the minimum military-training requirements established to maintain a commission in the grade and section in which appointed, and in their mobilization assignment

In addition to specific schooling or experience in any of the above fields, applicants for direct appointments must be at least twenty-one years old, citizens of the United States by birth or naturalization, must have an Army intelligence score of 110 or higher, physically qualified, with some waivers, and at least a bachelor's degree Some special fields require only a high-school education or equivalent preparatory school education

Age maximums and educational or experience minimums are second lieutenants, thirty years with four years college or experience, first lieutenants, thirty-three years with seven years college or experience, captains, thirty-seven years with at least eleven years college or experience, majors, forty-five years, with at least sixteen years college or experience, lieutenant colonels, fifty-one years, with at least twenty-one years college or experience, and colonels, fifty-five years, with at least twenty-six years college or experience

In the First Army area, correspondence may be directed to the Headquarters, New York-New Jersey-Delaware Military District at 90 Church Street, New York City

Occupational Therapy Association Meets

MORE than 500 leaders in the field of occupational therapy, representing every section of the United States, participated in the 31st Annual Convention of the American Occupational Therapy Association at the Hotel Pennsylvania, in New York City, September 7 to 11 The Association has approximately 3,000 members professionally engaged in rehabilitation activities

Among the speakers presenting papers were Dr Howard Rusk, chairman of the Department of Rehabilitation and Physical Medicine, Bellevue-New York University College of Medicine, Mr Holland Hudson, director of the Rehabilitation Service, National Tuberculosis Association, Dr Luther Woodward, field consultant to the National Committee for Mental Hygiene, and Dr Leland E Hinsie, assistant director, New York State Psychiatric Institute

On September 10 and 11, a teaching Institute presented recent developments and technics in the treatment of neuropsychiatric conditions Various trips to hospitals and other institutions in New York City and surrounding areas, on September 9 and 10, were arranged for those attending the Convention

$77,600 in Grants Made for Sclerosis Research

THE National Multiple Sclerosis Society has made grants totalling $77 600 to five medical institutions to conduct medical research projects into the causes and control of multiple sclerosis it was announced in August by Ralph I Straus president of the Society The causes of this crippling disease, the No 1 neurologic problem of the present time which attacks the central nervous system and which incapacitates thousands of young people in the prime of life, are not known

Included in these grants is a fund to establish the second multiple sclerosis research clinic to be financed by the Society This clinic was opened at the Albany Hospital Albany New York. Neurologists of the Albany Medical College will cooperate with the Division of Research and Laboratories of the New York State Department of Health in conducting the research program at the clinic.

The largest of the grants for research will go to Tulane University School of Medicine New Orleans Louisiana to finance a three-year study of the possible relationship between virus infection and the process of demyelination which is characteristic of the disease in which the myelin or fatty sheath of the nerves is dissolved and replaced by sclerotic tissue During the progress of multiple sclerosis the nerve lesion becomes more severe and the resulting scar tissue eventually prevents the passage of nerve impulses A progressive paralysis results

What causes this damage to the central nervous system has thus far eluded medical science Clinical observation of demyelinating diseases in humans suggests the possibility that some relation may exist between virus infection and myelin destruction.

Another grant voted by the Society will go to the Massachusetts General Hospital, in Boston, Massachussets for a two-year project that will be devoted to basic research in myelin degradation Cedars of Lebanon Hospital Los Angeles California, received a grant for an investigation of the behavior of the blood-clotting mechanism in multiple sclerosis.

The fifth grant was made to the New York University School of Medicine for a study of psychological factors in multiple sclerosis Leading medical institutions in New York will cooperate.

The voting of grants for the above five medical research projects brings to seven the number of projects into the causes of multiple sclerosis which have been financed by the National Multiple Sclerosis Society with headquarters in the New York Academy of Medicine Building, New York City since its formation in October 1946 less than two years ago

In June 1947 a grant of $64,350 was made to Columbia University for a three-year study in the field of allergy The first multiple sclerosis research clinic of the Society was established in March 1948 in Boston Massachusetts as a joint project of the Beth Israel and Boston State Hospitals

Immunization High in Westchester

WESTCHESTER stands first among the counties of the State in percentage of preschool age children who have been immunized against diphtheria according to word received by Dr E A. Lane, head of the Communicable Diseases Division of the Westchester Health Department, from the State Department of Health

For years, Westchester has been in second place exceeded only by much smaller Columbia County Last year Columbia led with a mark of 83 per cent This year Westchester scored a mark of 87 per cent immunizations while Columbia dropped to 78 per cent

Health Commissioner William A Holla and Dr Lane expressed satisfaction with the progress that has been made in the immunization campaign, and pointed out the current mark is particularly significant as Westchester is listed as having more than 15 000 children in the group in the area excluding municipalities of over 10 000 population, a number exceeded only by Erie Nassau and Suffolk counties and more than seven times the estimated approximately 2,000 children in that group in Columbia.

Six Westchester municipalities of over 10,000 population in the county health district attained honor roll ranking Dr Lane said Such ranking is given if 70 per cent or more of the preage children have been immunized. The honor communities are Mamaroneck, Ossining Peekskill Port Chester Scarsdale and White Plains.

Society for Crippled to Hold November Meeting in Chicago

THE twenty-eighth annual convention of the National Society for Crippled Children & Adults Inc. will be held at the La Salle Hotel Chicago November 15 to 17

Many outstanding speakers in the fields of medicine health and education will be on hand to present facts on progress in work with the handicapped during the past year according to Lawrence J Linck executive director

The convention will be attended by physicians therapists educators workers with the handicapped and representatives of National Society's more than 2,000 state and local units throughout the United States Canada, Alaska, and Hawaii

Heart Association Grant to Szent Gyorgyi Foundation

THE American Heart Association has granted $25 000 to the Szent Gyorgyi Research Foundation Inc. for studies in muscular contraction regarded as basic to complete understanding of the heart muscle it has been announced by Dr Tinsley R Harrison association president The research grant is the first to be made by the association.

The studies are being conducted by Dr Albert Szent Gyorgyi physiologist and his associates at the Marine Biological Institute Woods Hole Mass. Dr Cyorgyi is a Nobel prize winner in physiology and medicine. He is director of research of the foundation bearing his name which was incorporated this year to aid scientific and educational research

Qualifications for Specialist's Rating in Preventive Medicine Announced

APPLICATIONS from armed forces medical officers who want to be certified as specialists of preventive medicine may now be submitted to the Interim Board of Preventive Medicine, according to Department of the Army Circular No 234, dated August 5, 1948 The circular also outlines the qualifications required of applicants, and lists the items to be included in the applications Written and oral examinations will be held during the fall of 1948 or the spring of 1949

The circular also announces that the first group of officers to be certified will include those selected by the board as having "considerable experience and a long record of distinguished service in responsible preventive medicine or public health positions" For this first group, former training and supervised experience requirements, as well as written examination, will be waived

Examinations and certification will be administered by the Interim Board of Preventive Medicine, formed early this year by joint action of the Surgeons General of the Army, Navy, and U S Public Health Service in anticipation of the formation of an American Specialty Board in this field by the Advisory Board for Medical Specialties of the American Medical Association

Prerequisite qualifications include, among other things, membership in the American Medical Association, graduation from a medical school and internship in a hospital approved by the Council of Medical Education and Hospitals of the American Medical Association, or by the Army and Navy, the degree of Master of Public Health or its equivalent, and both supervised experience and experience in a position of responsibility, in the field of public health or preventive medicine

Applications Received for Army Medical Resident Training Program

APPLICATIONS for the Military Resident Training Program (in Army general hospitals) are currently being received in the Office of the Surgeon General. Under this training program any physician who qualifies for and accepts a commission in the Regular Army Medical Corps will be given the opportunity of competing for an approved residency in the field of his choice

Medical specialty training available for newly commissioned officers under this program is as follows

1 A limited number of senior residencies in thoracic surgery, orthopedics, pulmonary diseases, pathology, ophthalmology, and physical medicine

2 A limited number of residencies in orthopedics, pathology, and physical medicine

3 A limited number of assistant residencies in obstetrics, urology, thoracic surgery, dermatology, and pediatrics Some of these assistant residencies in urology, general surgery, internal medicine, and radiology are available at the Gorgas Hospital, Canal Zone

4 A substantial number of assistant residencies in anesthesia, general surgery, orthopedics, internal medicine, psychiatry, pathology, ophthalmology, otolaryngology, radiology, physical medicine, and clinical physician training

Those officers who are not selected to enter residency training on January 1, 1949, or July 1, 1949, will, if qualified, be furnished a certificate indicating the date on which they will enter approved professional training The program is designed to insure that all qualified applicants will be given the opportunity of completing their requirements for certification by an American Specialty Board

October 1, 1949, has been established as the deadline for receipt of applications from physicians who are interested in participating in this training program

Complete information and application blanks for the program may be obtained by writing to the Surgeon General, Department of the Army, Washington 25, D C

Prize Offered for Obstetric and Gynecologic Paper

THE South Atlantic Association of Obstetricians and Gynecologists has announced the establishment of "The Foundation Prize" Authors of papers on obstetric and gynecologic subjects desiring to compete for the prize may obtain information and details concerning the prize from Dr E D Colvin, Secretary-Treasurer, 1259 Clifton Road, N E, Atlanta, Georgia

PERSONALITIES

Appointed

Dr Robert F Korns, Albany, as director of State Health Department's Bureau of Communicable Disease Control As chief of the tuberculosis control branch in Japan, with headquarters in Tokyo, Dr Melville D Dickenson, Geneva Dr Frank Dutra, pathologist of the Kettering Laboratory of Applied Physiology at the University of Cincinnati, Ohio, and pathologist for the coroner's office, Hamilton County, Ohio, as medical examiner for Westchester County As assistant medical examiner for Westchester County, Dr Andrew Eggston, Mount Vernon

Dr Gustav J Beck, Gloversville and New York City, as assistant in medicine on the faculty of Columbia University, College of Physicians and Surgeons Dr David L Cronin, New York City, to the staff of the Division of Clinical Research, Schering Corporation, Bloomfield and Union, New Jersey

COUNTY NEWS

Allegany County

Dr Charles LeRoy Steinberg, senior visiting physician and physician-in-charge of the Arthritis Clinic, Rochester General Hospital, addressed the Allegany County Medical Society on September 9 at the Bolivar Country Club Bolivar Dr Steinberg's subject was "Chronic Arthritis—Its Diagnosis and Management.

This postgraduate instruction was arranged by the Medical Society of the State of New York with the cooperation of the New York State Department of Health

Bronx County

New officers assumed office in the Bronx County Medical Society on July 1 and will continue in office until June 30 1949 They are president Dr Renato J Azzari president-elect Dr Henry J Barrow, vice-president, Dr Abraham Tamis secretary, Dr Goodlatte B Gilmore, treasurer Dr Charles W Frank editor of the *Bulletin* Dr Philip Eichler chairman, public relations committee Dr George Schwartz chairman legislation committee Dr James A. Lynch chairman, public health committee, Dr Joseph Golomb chairman, medical economics committee Dr Thomas McCarthy

Franklin County

Free chest x rays were available to all adult residents of Franklin County during four days of the Malone Fair in August according to an announcement by Executive Secretary Virgie Lee Smith of the Franklin County Tuberculosis and Public Health Association. The project was endorsed by the Medical Society of the County of Franklin

Fulton County

Dr D Philip McGuire, Johnstown and New York City, read a paper on medical technic to members of the Fulton County Medical Society on August 11 at a luncheon meeting at the Saratoga Country Club Dr McGuire has recently returned from Europe, where he made a study of medical and surgical practices

Madison County

The summer meeting of the Madison County Medical Society was held on August 19 at the home of Dr and Mrs. Milton R. Joy in Cazenovia After the business meeting speakers were Dr T Wood Clarke, Utica, whose subject was Champlain's Invasion of New York State and the Battle of Nichol's Pond, and Dr Lee S. Preston Oneida, speaking on 'The Founding and Early Days of the Madison County Medical Society

Monroe County

A program for closer cooperation between the Monroe County Medical Society and the Rochester Chapter of the American Red Cross in operation of the Rochester Regional Blood Program has been agreed upon That was revealed in a joint announcement by Dr Ellis B Soble medical society president, and Thomas R. White chairman of the regional blood program.

Principal points in the program call for adequate representation of the Monroe County Medical Society on the executive board of the blood program and for enlargement of the society's blood bank committee which is to have direct supervision over 'all affairs pertinent to the medical and technical operations of the program.'

Present members of this committee are Dr Herbert R. Brown Jr medical director of the blood program Dr Earle B Mahoney and Dr Walter S Thomas. Three more members of the group will be appointed in the near future Dr Soble said

The new program, Dr Soble pointed out follows recommendations made by the American Medical Association at its recent convention in Chicago

Nassau County

A mobile chest x ray unit and its staff of technicians from the State Department of Health made free x-ray examinations of visitors fifteen years of age and older at the Mineola Fair on September 14 to 18 The Medical Society of Nassau County and its Woman's Auxiliary participated in the health exhibit at the fair

Orange County

Postgraduate instruction has been arranged for the Orange County Medical Society to be given on Tuesday evenings at 8.30 P.M. at the Court House Goshen On September 28 Dr Henry D Diamond clinical assistant physician at Memorial Hospital New York City, will speak on 'The Significance of Enlarged Lymph Nodes.

The scheduled November lectures are by Dr A H Aaron clinical professor of medicine, University of Buffalo School of Medicine, Buffalo whose subject on November 9 will be "The Evaluation of the Common Drugs in General Practice, and by Dr H S Weichsel, compensation medical examiner New York State Workmen's Compensation Board State Department of Labor, New York City, on November 23 speaking on 'Trauma and Peripheral Vascular Disease.

On September 14 Dr Charles L Fox, Jr assistant professor of bacteriology, College of Physicians and Surgeons, Columbia University New York City spoke on Electrolytes in Shock in Relation to Blood and Plasma Therapy These instructions were provided by the Medical Society of the State of New York in cooperation with the State Department of Health.

Otsego County

Neurology in General Practice was the subject of the lecture given by Dr Wardner D Ayer professor emeritus of clinical medicine at Syracuse University College of Medicine to members of the Otsego County Medical Society on September 1 at the Oneonta Country Club This postgraduate instruction was arranged by the Medical Society of the State of New York with the cooperation of the State Department of Health

Richmond County

On Wednesday evening, October 13, at 9.30 P.M., Dr Linn J Boyd director of medicine New York Medical College, Flower and Fifth Avenue Hospitals, New York City will speak to members of the Richmond County Medical Society on the subject of 'Pulmonary Embolism. The meeting will be held at the Old Mill Hyland Boulevard Staten Island.

The lecture was arranged by the Council Com

mittee on Public Health and Education of the Medical Society of the State of New York with the cooperation of the State Department of Health

New chairmen of committees of the Richmond County Medical Society have recently taken office and will serve until June, 1949 They are Dr M Werner, economics, Dr H A. Cochrane, blood bank, Dr Milton S Lloyd, insurance, Dr D V Catalano, maternal and child welfare, Dr Oscar Auerbach, nominating, Dr Jacob J Silverman, publishing, Dr Joseph F Worthen, public relations, Dr E Fieramosca, pharmaceutical and public health committees, Dr John J Goller, legislative, Dr Joseph V D'Agostine, compensation, Dr Charles Reigi, industrial, Dr M D Radding, cancer, and Dr Edward H Robitzek, tuberculosis

Rockland County

Vitamins donated by Lederle Laboratories were shipped in August, in the name of the Rockland County Medical Society, to Echternach in Luxembourg The program was arranged by the Boy Scouts in Rockland Dr John C Dingman, Spring Valley, is president of the County Boy Scout Council The community of Echternach, Dr Dingman said, was pillaged by German occupation troops during the war

Steuben County

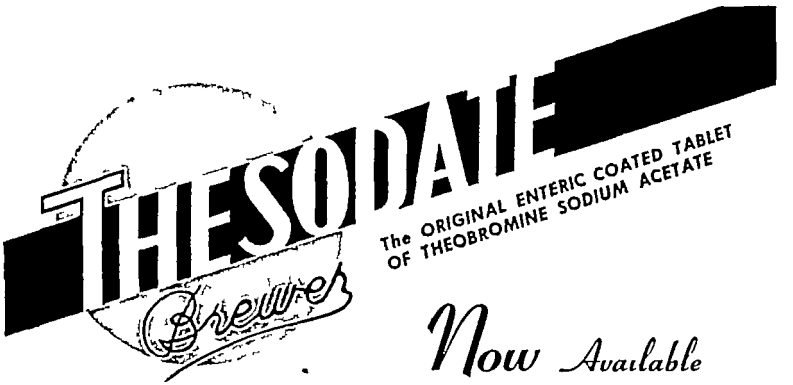
"Recent Developments in Diseases of the Liver" was the subject of Dr Jacob D Goldstein, assistant professor of medicine and bacteriology, University of Rochester School of Medicine and Dentistry, Rochester, who spoke to members of the Steuben County Medical Society on September 9 The instruction, which was held at the Hotel Sherwood in Hornell, was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York with the cooperation of the State Department of Health

Sullivan County

Dr Irl H Blaisdell, clinical associate professor of otolaryngology at Syracuse University College of Medicine, Syracuse, will speak on the subject of "The Problem of Carcinoma of the Larynx" on Wednesday evening October 20, at 8 30 P M This postgraduate instruction, arranged for the Sullivan County Medical Society by the Medical Society of the State of New York with the cooperation of the State Department of Health, will be held at the Lenape Hotel, Liberty

---

U S PUBLIC HEALTH EXPERTS TO AID U N FIGHT AGAINST TUBERCULOSIS



Two tuberculosis experts from the U S Public Health Office, Dr Carroll Palmer and Dr Lydia Edwards, are to join the international staff now engaged in the antituberculosis vaccination program of the United Nations, it was announced in August by the United Nations International Children's Emergency Fund They will leave shortly for Copenhagen, where they will work in the State Serum Institute on the research end of the undertaking

This vaccination project, which is a joint enterprise of the Children's Fund, the World Health Organization, and the Danish Red Cross and its Scandinavian associates under the direction of Dr Johannes Holm of Denmark, is the largest mass immunization ever undertaken It calls for the testing of between 40 and 50 million children in Europe alone, and the vaccination of all found uninfected Plans are also being made for setting up similar programs in Algeria, Morocco, Tunisia, and in China. Further extension of the programs to countries in Southeast Asia and in Latin America is contemplated For this enterprise a total of $4,000,000 has already been allocated by the Children's Fund, and by early fall the testing and inoculation will be underway in a number of European countries

The vaccine to be used is BCG (Baccillus Calmette Guerin), named for the two French scientists who began work on it in 1908 It was first used for child vaccination in 1923 Since then it has become widely accepted as an effective protective measure in a number of European countries

The two United States specialists will work on setting up studies for the purpose of measuring the effectiveness of the vaccine Millions of records will be gathered which, it is predicted, will form the basis of one of the greatest epidemiological studies ever made Unusual interest is attached because it is work made possible only because there is such an organization as the United Nations through which the undertaking can be developed and carried out on a world-wide scale

Dr Palmer has been with the research office of the tuberculosis control unit of the U S Public Health Service since its organization five years ago Dr Edwards has also spent a good part of her professional career in the tuberculosis field Prior to joining the health service, she was in charge of the children's tuberculosis clinic in Johns Hopkins University in Baltimore Immediately after the war she was with the United Nations Relief and Rehabilitation Administration in Czechoslovakia

Now Available

IN AN ADDITIONAL POTENCY

to meet the requirements
and requests of many physicians

THE NEW STRENGTH – 7½ gr enteric coated green tablets with ¼ gr phenobarbital has been formulated for physicians wishing to prescribe the same effective amount of Theobromine Sodium Acetate but with less amount of sedative

Complete List of Potencies—

THESODATE
(7½ gr) 0.5 Gm.* or (3¼ gr) 0.25 Gm.*

THESODATE WITH PHENOBARBITAL
(7½ gr) 0.5 Gm. with (½ gr) 30 mg.
(7½ gr) 0.5 Gm. with (¼ gr) 15 mg
(3¼ gr) 0..5 Gm. with (¼ gr) 15 mg *

THESODATE, POTASSIUM IODIDE PHENOBARBITAL
(5 gr) 0.3 Gm. (2 gr) 0.12 Gm. (¼ gr) 15 mg.

* Supplied also in capsules (not enteric-coated) for supplementary medication.

PROVIDES A WIDE RANGE OF AN EFFECTIVE MEDIUM FOR TREATMENT IN CORONARY DISEASE.

Clot Dissolution During Dicumerol Therapy

To the Editor

In their syndicated column which appears in the *Long Island Press*, Hubbard and Isabella Hoover entertainingly discuss the use of dicumerol which Mr Hubbard had received during hospital treatment for a "blood clot" In light of some extravagant newspaper publicity given this so-called "miracle worker," Mr Hubbard's readable and intelligent lay description is refreshing He mentions that, while some doctors feel that dicumerol "dissolves" the clot, others "more conservative" say that it will merely prevent clot accretion or the formation of new ones

That these alternative cases are moot is proved by the emphatic denial with which most physicians, even authorities on anticoagulant therapy, greet the former case The descriptive literature on dicumerol also stresses that clots are not dissolved, and this several years after Swedish investigators (pioneers in anticoagulant therapy) appear to have accepted clot dissolution during such therapy as a fact And as a matter of this fact, the possibility of physiologic intravascular clot dissolution must be known to any physician doing extensive intravenous injections, who occasionally thromboses a vein with a drug like mercuripurin and finds feasible re-entry of the same vein and a fluid current therein, 24 to 48 hours later Progressive theories of the nature and mechanism of physiologic coagulation call for the probability that continuous fibrin formation and fibrinolysis are occurring within the vascular system of the healthy organism In such an organism, restoration in the continuity of thrombosed channels probably does not await the classic pathology textbook sequence of clot organization, capillary budding, and endothelial coring The pathologic evidence for the physiologic sequence does not exist simply because cases of successful vascular channel restoration through fibrinolysis do not so often come to autopsy

There is, however, some strong additional evidence for the case for fibrinolysis Following the administration of dicumerol, about one third of the subjects studied in a recent series show a rapid spontaneous liquefaction of the prothrombin-time-determination clot as it is formed in the test tube if the prothrombin-time-determination reaction mixture is kept at body temperature for a few hours Photographs of this liquefaction were recently published in another connection (J Am Pharm, A 36 225 (Aug) 1947)

The rapidity of clot liquefaction after dicumerol administration does not exactly parallel the fall in prothrombin concentration and may be conditioned by the autochthonous relative hyperheparinemia which some dicumerolized patients exhibit The fibrinolysis phenomenon seems to coincide with the rate of clinical response, the latter again is frequently too rapid to be accounted for on the basis of the slow pathologic sequence of organization-recanalization

An appreciation of the distinct possibility of rapid clot dissolution through the agency of dicumerol therapy would appear to be essential to the intelligent exploitation of such therapy

The American Academy of Pediatrics

To the Editor

On page 1276 of the June 1 issue of the JOURNAL there appears an item which reflects a misquotation which originated in the *Washington Post*, March 14, and which gives a false impression of the views of the American Academy of Pediatrics in relation to the American Medical Association and socialized medicine In order that your readers may be correctly informed may I set forth the facts of the matter as follows

On March 11 I appeared before the Health Subcommittee of the Senate Committee on Labor and Public Welfare to testify on the School Health Services Bill (S 1290) at the request of Senator Smith, chairman of the subcommittee, and Senator Saltonstall, sponsor of the bill In particular, I was requested to review some of the pertinent findings of the Academy of Pediatrics' Study of Child Health Services In reference to the terms of the bill which provide for treatment of defects and conditions found in school health examinations, the following statement was made which now appears in the printed official record of the hearing "The Academy is on record as approving the provision of medical services to those unable to pay for such services But the Academy is vigorously opposed to any program in which federal funds are used to provide medical treatment for those who are able to take care of themselves"

In commenting upon this testimony, the *Washington Post* attributed to me the following statement which I did not make and for which there was no foundation "Not all of us share the American Medical Association's philosophy of fear of socialized medicine"

The *Washington Post* misquotation was picked up by Dr Marjorie Shearon in her news bulletin on medical legislation Dr Shearon was advised of the error and made a generous apology in her bulletin under date of April 2, 1948 She stated, "In my release for March 19 I referred to the testimony given by Dr John Hubbard for the Senate Health Subcommittee and to a feature article which appeared in the *Washington Post* in which Dr Hubbard was quoted as saying that the American Academy of Pediatrics does not fear socialized medicine

[Continued on page 2076]

WHEN *Anorexia* POSES SPECIAL PROBLEMS

Periods of anorexia following infectious disease and surgery can readily produce a series of consequences detrimental to the patient (a) curtailed food consumption (b) further deterioration of the nutritional state and (c) impeded recovery

When anorexia occurs activation of food interest becomes a first consideration for rapid convalescence Highly nutritious food which is at the same time tasteful stimulative to the appetite, and easily digestible thus possesses both a dietary and a therapeutic worth

In convalescence when appetite lags the delightfully tasteful food drink made from Ovaltine and milk has particular usefulness for inciting food interest It gives the patient a threefold combination of important dietary values worth while amounts of virtually all essential nutrients easy digestibility and appetizing tastefulness Three glassfuls of Ovaltine daily can convert even a dietetically poor to fair food intake to full nutritional adequacy

THE WANDER COMPANY, 360 N MICHIGAN AVE. CHICAGO 1 ILL

Ovaltine

Three servings daily of Ovaltine each made of ½ oz. of Ovaltine and 8 oz. of whole milk,* provide

CALORIES	659	VITAMIN A	3000 I U
PROTEIN	32.1 Gm.	VITAMIN B_1	1.16 mg.
FAT	31.5 Gm	RIBOFLAVIN	2.00 mg.
CARBOHYDRATE	64.8 Gm.	NIACIN	5.8 mg.
CALCIUM	1.12 Gm.	VITAMIN C	30.0 mg.
PHOSPHORUS	0.94 Gm.	VITAMIN D	417 I.U.
IRON	12.0 mg	COPPER	0.50 mg

*Based on average reported values for milk.

[Continued from page 2074]

in the same way the American Medical Association does The article in other respects conformed with the testimony given by Dr Hubbard at the Senate hearing However, with respect to the paragraph on socialized medicine, I am informed by Dr Hubbard that the *Post* reporter misquoted him That being the case, I hasten to apologize to the American Academy and to Dr Hubbard for having published the paragraph regarding socialized medicine and federal subsidy which I now learn was not wholly accurate "

Augmented Unipolar Leads

To the Editor

I should like to call the attention of your readers to an inaccuracy which appeared in the paper of Lieberson and Goldbloom, NEW YORK STATE JOURNAL OF MEDICINE, July 1, 1948, page 1467

The augmented unipolar extremity leads, aVL, aVR, and aVF, which they use in their device were invented by me in 1942 (Am Heart J 23 483, 1942), and for them to call them "augmented limb leads of Wilson" is misleading In the above paper I pointed out that these augmented limb leads could be obtained using an indifferent electrode of zero potential of the Wilson type, or the indifferent electrode which I also invented

I also devised the terms, aVL, aVR, and aVF, to differentiate the augmented unipolar extremity leads from the ordinary unipolar extremity leads of Wilson, which are called VL, VR, and VF

EMANUEL GOLDBERGER, M D
111 East 61st Street
New York City

July 12, 1948

To the Editor

We called the augmented unipolar limb lead obtained with the apparatus "augmented limb leads of Wilson" not to ignore any of the substantial contributions Goldberger made in this field, but rather to indicate that the indifferent electrode of zero potential used in the apparatus is of the Wilson type with balanced resistances rather than the type suggested by Goldberger without resistances

Goldberger's statement that the augmented limb leads obtained using the Wilson type of indifferent electrode is the same as those obtained with the indifferent electrode he proposed is questionable and is undergoing investigation at present Bruno Kisch, for instance, concludes from some interesting experiments which he conducted recently that Goldberger's augmented unipolar limb leads are not in accordance with the concept of unipolar electrocardiography, since the "zero potential" against which the a-V leads are taken is different for each extremity of the same person (Exper Med & Surg 4 1 (February) 1948) It is therefore understandable that in designing an apparatus to take augmented limb leads the method of Wilson with paired resistance was used rather than Goldberger's

SURGICAL TREATMENT OF INTRACTABLE ASCITES DESCRIBED

The surgical treatment of intractable ascites by the intramuscular peritoneal drainage operation was described by Dr Jere W Lord, New York City, at a meeting of the Academy of Medicine

There are three important physiopathologic states which lead to the formation of ascites The first and most frequently observed one is cirrhosis of the liver The second cause is the implantation of a malignant neoplasm of the peritoneum usually secondary to carcinoma of the gastrointestinal tract or the ovary, but occasionally the neoplasm is primary such as a mesothelioma The third is cirrhosis of the liver due to repeated and longstanding congestive heart failure

There is a significant group in which the ascites is intractable and will not respond to the best management requiring repeated paracenteses for relief In patients with cirrhosis of the liver, whatever the etiology, not only is this a tedious and painful procedure but, of greater importance, the prolonged loss of protein often leads to cachexia and death. Similarly, the control of ascites secondary to malignant peritoneal implants clouds the last weeks and months of many of these patients, although in other respects they may be fairly comfortable

An operative procedure has been devised wherein the ascitic fluid is enabled to flow through the lumen of a glass button into a large subcutaneous pocket, the deeper aspect of which is formed by the muscles of the abdominal wall Exposure of these muscles to the ascitic fluid is brought about by wide resection of the overlying deep fascia Hence, the fluid is absorbed continuously by means of the lymphatics in the muscles

Eight patients with intractable ascites have been operated upon by the procedure outlined above The results have been as follows complete subsidence of ascites in four patients, persistence of the ascites to a very mild degree without need for further paracenteses in two patients, failure in one patient and one patient died two weeks postoperatively from massive hemorrhage

For Trichomoniasis

Picragol®

Silver Picrate Wyeth

• Picragol combines the germicidal activity of the silver ion as found in silver nitrate, with the blandness of silver protein preparations Picragol is a powerful bactericide, fungicide and protozoacide, yet is practically nonirritating Picragol is recommended in trichomoniasis and mixed infections of the vagina or male urethra

Picragol Crystals—Silver Picrate Wyeth 2 gram bottles

Compound Picragol Powder—Silver Picrate 1% in Kaolin, 5 gram bottles

Vaginal Suppositories Picragol—Silver Picrate, 1 and 2 grams in Boroglyceride Gelatin, boxes of 12

Vaginal Powder Insufflator, supplied separately or in kits containing 6 vials Compound Picragol Powder

Wyeth®

LEG ULCERS

the DAXALAN-DOME PASTE BANDAGE TECHNIQUE

AS INTRODUCED BY DR. WILLIAM M. COOPER, Director Department of Peripheral Vascular Diseases—New York Polyclinic Medical School and Hospital.

This technique is based on a 3 point program—

1. Reductio of dermatitis with wet dressings of DOMEBORO TABS (BUROW'S SOLUTION)
2. Combat local infection and stimulate healing with thick application of DAXALAN in the center of the ulcer and surrounding areas.
3. Overcome venous insufficiency stasis and edema by wrapping DOME PASTE BANDAGE around the entir leg to supply compression.

DOME CHEMICALS INC 250 EAST 43rd STREET NEW YORK 17, N Y

Makers of the Soothing Modernized Form of Burow's Solution

DOMEBORO —Tablets Powder - Packets Ointment

Daxalan is our trademark for rigidly standardized whole crude coal tar paste, (low 1 naphthalene content) uniform color free of coal tar specks and aged for six months.

Dome Paste bandage is flesh colored, 4 x 10 yd gauze bandage impregnated with modified "Unna Formula" consisting of zinc oxide, glycerine, gelatine and calamine. This Unna's Boot comes to you in sterl condition and is ready for instant use

for Constipated Babies

Borcherdt's Malt Soup Extract is a laxative modifier of milk. One or two teaspoonfuls in a single feeding produce a marked change in the stool Council Accepted. Send for sample

"The General Practitioner Can Relieve 3 out of 4 . . ."

One acute researcher has noted that the odor of frying bacon causes emptying of the gallbladder in some subjects

1 Gallbladder emptying is better stimulated by bacon's traditional companion-in-the-pan, the egg, the yolk preferred, and of course, unfried Butter and cream do as well.

2 Utilization of the fat is aided by giving Doxychol-K, its desoxycholic acid content is noted for efficient transport of fatty compounds across the intestinal mucosa.

3 Doxychol-K also markedly increases the flow of hepatic bile to further improve drainage of the biliary tract.

And there we have the essentials of the medical management of biliary tract dysfunction.

Significantly, "3 out of 4 such patients seen by the general practitioner routinely can be improved or relieved by attention to details of medical care."

Doxychol-K

Each tablet is composed of:
Ketocholanic acid . . . 0.2 Gm.
(provides approximately 90% dehydrocholic acid)
Desoxycholic acid . . 0.65 Gm.

• In Brazil as all over the world, Nestlé's milk products are widely used for infant feeding

World-wide use in infant feeding

Every country in South America is supplied with Nestlé's milk products through strategically located plants and a vast network of distribution facilities.

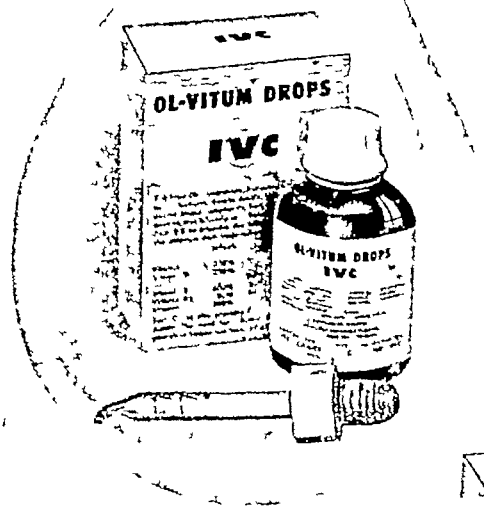
Nestlé's milk products have consistently kept step with new *developments in the scientific* feeding of infants. For over 80 years Nestlé's milk products have been best known and most used for babies 'round the world.

Nestlé's policy has always been to work closely with the medical profession and to meet each advance in scientific knowledge with a corresponding improvement in *product. Thus Nestlé's was the first* evaporated milk fortified with 400 U.S.P. units of genuine Vitamin D_3 per pint.

Rigid controls assure the quality of Nestlé's Milk every step of the way... we even take the plant apart every day and wash it!

That's why so many doctors recommend NESTLÉ'S Milk

NESTLÉ'S EVAPORATED MILK



"...what precious drops are these"

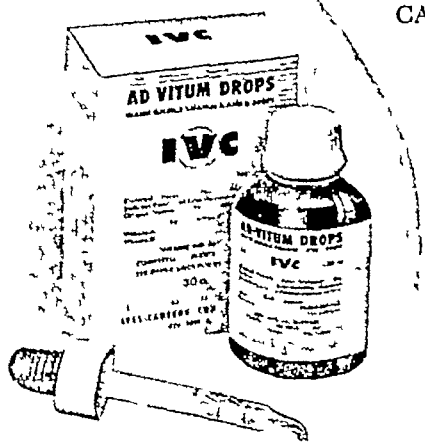
TWO PRODUCTS OF OPTIMUM ACCEPTABILITY



OL-VITUM Drops. For a highly palatable multi-vitamin dietary supplement, that is completely dispersible in food or any aqueous fluid, Ol-Vitum Drops are meeting a gratifyingly high professional acceptance Like all IVC products, they are found to be CLINICALLY ECONOMICAL

Each cc contains

Vitamin A	10,000 USP Units
Vitamin D	2,000 USP Units
Vitamin B_1	3 milligrams
Vitamin B_2	0 8 milligrams
Vitamin C	100 milligrams
Vitamin B_6	1 6 milligrams
Niacin Amide	15 milligrams
Natural Mixed Tocopherols	3 milligrams (Equivalent to 2 25 milligrams alpha Tocopherol Acetate)

AD-VITUM Drops. In vitamin therapy or dietary supplementation where high potency of the A-D combination alone is indicated, Ad-Vitum Drops are especially desirable Like its companion product, Ad-Vitum Drops are palatable, will mix with food or any aqueous fluid and again are CLINICALLY ECONOMICAL

Distilled Vitamin A Ester, Viosterol in Oil, Sorbitan Fatty Acid Ester derivative, Vegetable Oil and Glycerin in a flavored aqueous vehicle

Each cc contains

Vitamin A	30,000 USP Units
Vitamin D	5,000 USP Units

Continue until weaning.

No substitute for mother's milk is more highly regarded than Similac for feeding the new born, twins, prematures, or infants that have suffered a digestive upset Similac gives uniformly good results in these special cases simply *because it resembles breast milk so closely* Normal babies thrive on it *for the same reason*

This similarity to breast milk is definitely desirable—from birth until weaning.

M & R DIETETIC LABORATORIES, INC • COLUMBUS 16, OHIO

The Tar Preparation... THAT NEVER ENCOUNTERS PATIENT RESISTANCE

Tarbonis
is widely prescribed in
Eczema
Psoriasis
Ringworm
Occupational Dermatitis
Folliculitis
Seborrheic Dermatitis
Intertrigo
Pityriasis
Pruritus
Tinea Cruris
In 2¼ oz., 8 oz., 1 lb and 6 lb jars

When infection supervenes SUL TARBONIS combines the bacteri cidal properties of sulfa thiazole (five per cent) with the virtues of Tarbonis

RARE INDEED would be the physician who has not encountered patient resistance to tar preparations The objectionable odor, the staining and soiling of skin, linen and clothing, the unsightly appearance on exposed body surfaces, whether the preparation be white or the blackish-brown tar color, have proved serious stumbling blocks in the use of tar, regardless of its high therapeutic efficacy in a host of frequently seen conditions

In Tarbonis, an alcoholic extract of carefully selected tars (5 per cent) incorporated together with lanolin and menthol in a vanishing-type cream, this therapeutic efficacy is fully preserved, but all objectionable features are overcome

Tarbonis leaves no trace on the skin, requires no removal before reapplication It is free from all tarry odors, instead presents a pleasant soapy scent. It is greaseless, nonstaining, and nonsoiling — not only to skin but to linen and clothing as well

Since Tarbonis is nonirritant even to the tenderest skin, it may be applied as often as desired, thus assuring a high degree of clinical success

Physicians are invited to send for professional sample

"RESULTS HAVE BEEN SO GRATIFYING *that there appears to be little occasion for change.*"[1]

This is the opinion shared by many clinicians who have used INTRADERM TYROTHRICIN in stubborn cases of acne vulgaris, sycosis vulgaris furunculosis, impetigo and other pyogenic skin infections.

INTRADERM TYROTHRICIN presents tyrothricin, most powerful antibiotic for local use in a unique skin penetrant vehicle permitting rapid diffusion of the medication throughout the affected area

ADVANTAGES: Rapid and sustained antibacterial effect Non irritating to skin Active even in presence of pus, serum, and exudates Does not give rise to drug fast strains Leaves no unsightly film, making it most acceptable to patient.

confidence in Conti through the years

the perfect olive oil trio for baby's skin

Since 1836, CONTI Castile Soap U S P has been prescribed with confidence by physicians Now that this famous soap has become one of a triumvirate, with the addition of CONTI Baby Oil and Baby Powder, even greater protection can be given to the infant's tender skin

CONTI Baby Oil, containing specially refined olive oil, is pure, nonirritating and free from rancidity It is an aid in preventing diaper rash, useful in massaging the baby scalp, and for cleansing all portions of the body

CONTI Baby Powder fine textured, made with the finest imported white talc, is treated with refined olive oil by special spray process

All three of these CONTI products will prove worthy of use by the most discriminating

CONTI BABY OIL

CONTI BABY POWDER

EXPERIENCE IS THE BEST TEACHER...

Carlos Finlay (1837-1915)

proved it in public health

Carlos Finlay, of Cuba a bacteriologist, believed that yellow fever was transmitted by the stegomyia mosquito His original experiments did not provide definite proof of his theory However he continued his search in co-operation with Walter Reed and the Yellow Fever Commission The work of the Commission finally proved that infected mosquitoes could transmit the fever The public health preventive measures derived from these experiments were so successful that the fever in Cuba was under control within a year

R. J. Reynolds Tobacco Company Winston-Salem, N. C.

Experience is the best teacher in cigarettes, too!

MILLIONS of smokers who have tried and compared many different brands of cigarettes have found that cool, mild flavorful Camels suit them best

Try Camels on your "T Zone"—T for Taste T for Throat See how your taste enjoys the rich full flavor of Camel s choice, properly aged and expertly blended tobaccos See if your throat doesn t welcome Camel s cool, cool mildness.

Yes! Try Camels and see for yourself why with thousands and thousands of smokers, Camels are the "choice of experience.

According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette

Three independent research organizations in a nationwide survey Led 113,597 doctors to name the cigarette they smoked More doctors named Camel than any other brand.

"This is LIFE..."

Protein is essential in the diet. It is life itself But people cannot always have it in the palatable form of red meat. For example, a surgical patient faces the shock of tissue destruction blood loss, loss of body protein. Before and after surgery Protein Hydrolysate Baxter materially helps to meet the protein needs of the surgical patient. This new achievement of Baxter research is a beef product prepared from bovine plasma enzymatically digested Autoclaved, proven sterile and non pyrogenic, It is conspicuously free from reactions. Full information is available on request.

in dysmenorrhea

"Pavatrine provides a high percentage of prompt alleviation of dysmenorrheic pain:"*

In two series of patients totalling 221 Viggiano* found Pavatrine "a most efficacious agent in the treatment of dysmenorrhea" in that 76.6 per cent of the patients obtained complete or moderate relief

This non-narcotic antispasmodic proved to be "a safe and effective medication for the symptomatic treatment of dysmenorrhea and for reducing absenteeism among women workers.

Pavatrine has a dual relaxing effect—neurotropic and musculotropic—on the smooth muscle of the uterus bowel and bladder—with accompanying relief of pain in spastic conditions of these organs.

In the management of dysmenorrhea best results are obtained if medication is begun three to five days preceding menstruation.

Aluminum

PENICILLIN*

ORAL TABLETS

Aluminum Penicillin Oral Tablets are clinically effective in the treatment of penicillin susceptible infections

Containing the almost insoluble trivalent aluminum salt (not a mixture), they provide for maximum utilization of the dose administered

Low solubility of Aluminum Penicillin renders it much less liable to inactivation in the stomach Destruction in the intestinal tract is inhibited by the addition of sodium benzoate Slow conversion to a readily absorbed form in the more alkaline conditions of the intestinal tract enhances clinical effectiveness

Aluminum Penicillin is not toxic in doses far exceeding those used therapeutically and does not cause gastric disturbance

Specify Aluminum Penicillin Oral Tablets, H W & D

Supplied in vials of twelve tablets each containing Aluminum Penicillin, 50,000 units, and sodium benzoate, 0 3 gram

* Patent applied for

Oral Tablets

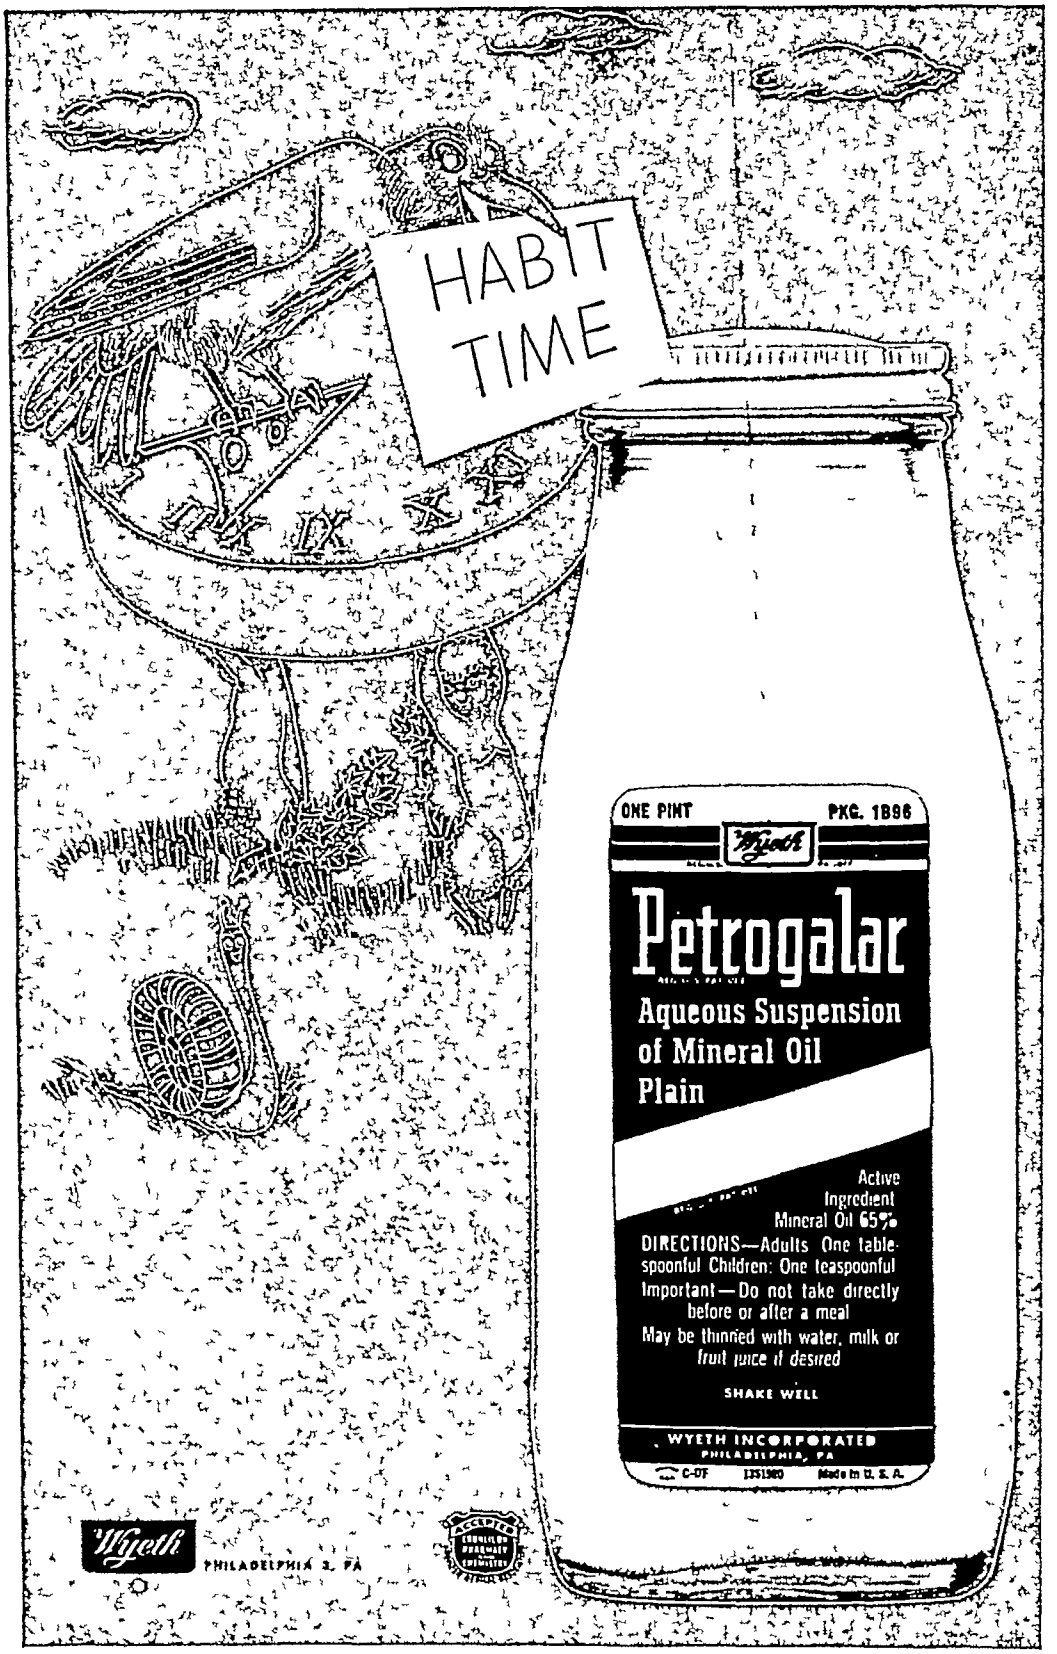
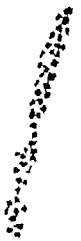
To forestall this eventuality

C S C Syrup CHOLINE BICARBONATE



When instituted early and in conjunction with a diet providing large amounts of protein and B complex vitamins, Choline therapy interrupts the chain of events in the development of portal cirrhosis. Thus fatty infiltration of the liver, the forerunner of cirrhosis, is overcome, and the fatal complicating cirrhosis is either forestalled or prevented.

Syrup Choline Bicarbonate C S C, an entirely new choline preparation for therapeutic use, is an advantageous means of administering choline. It is an unusually palatable mixture, provides the equivalent of 12.5 per cent choline base or 14.4 per cent choline chloride, and may be given in full therapeutic dosage without gastric intolerance or nausea.



Available at all pharmacies in one pint bottles.

adrenolytic and sympatholytic vasodilator

PRISCOL

" a valuable adjunct to the treatment of peripheral vascular disease "[1]

Priscol hydrochloride, administered either orally or parenterally counteracts the constrictive effect of epinephrine-like substances which are formed at the vascular myoneural junction

Priscol therefore produces circulatory improvement in many cases of Raynaud's disease Buerger's disease, diabetic gangrene and arteriosclerotic peripheral vascular disease.

Patients should be closely observed until optimal dosage is established since paradoxical effects or orthostatic hypotension may occur

Issued: Tablets of 25 mg bottles of 100 and 1000
10 cc Multiple-dose Vials, each cc. containing 25 mg

puerperal morbidity reduced

Pelvicins*

[penicillin vaginal suppositories Schenley]

In a recent controlled study [1] of 1,573 obstetrical patients, the incidence of genital tract infections was reduced from 5 3 per cent to 2 3 per cent when penicillin vaginal suppositories were used *A decline of 56 6 per cent!*

ADDITIONAL ADVANTAGES PELVICINS (penicillin vaginal suppositories Schenley) shorten the hospitalization period, reduce nursing care required, are completely painless and nonirritating These advantages suggest the value of their routine use in obstetrical procedure

SIMPLICITY OF TECHNIQUE Insert 2 PELVICINS (total, 200,000 units of penicillin) into posterior fornix of vagina with a sponge forceps, immediately after delivery of the placenta

SUPPLIED Boxes of 6 and 12 PELVICINS, 100,000 units each

a new approach to the cough problem

SYRUP URETHANE -MRT

(an original MRT contribution)

SYRUP URETHANE-MRT a unique development of the Marvin R. Thompson Inc. laboratories designed for the effective relief and control of coughs accompanying the common cold, bronchitis or other respiratory disorders.

SYRUP URETHANE-MRT IS EFFECTIVE because its action is direct – similar to that of codeine – but derived entirely from urethane, which by suppressing the overactive cough reflex provides speedy comfort rest and relief

SYRUP URETHANE-MRT IS SAFE because unlike codeine its hypnotic and/or sedative properties are negligible Moreover the active drug urethane is non habit forming – non toxic Containing no alcohol it is ideal for children, non-constipating and causes no gastric discomfort.

SYRUP URETHANE MRT IS SIMPLE because it is a complete cough preparation unto itself—requiring no admixture with other expectorants to increase its effectiveness. However it is ideally adapted for compounding with other agents if desired.

SYRUP URETHANE-MRT IS PLEASANT because it has a delightful taste and is pleasantly aromatic. Its emerald green hue gives it eye-appeal as well

Each teaspoonful (5 cc.) contains Urethane 4 Gr., in a flavored syrup base.

Directions One teaspoonful every 3 or 4 hours or as directed by the physician

Mr Preen always SHAVES *his breakfast*

When will people like Preen discover that a thousand missed breakfasts can add up to one subclinical vitamin deficiency? You know that *chronic breakfast skipping eventually can evoke a half sick, half well* complaint just as easily as chronic hurrying chronic worrying or faddist dieting Since these cases are usually the result of months—perhaps years—of nutritional sidestepping they often need immediate vitamin supplementation in conjunction with dietary reform To offset the whims of the patient s appetite and the wide variances in food values many physicians continue vitamin supplementation for the duration of treatment Very often their choice is DAYAMIN Abbott s potent multivitamin capsules Each easy to-take capsule contains six essential vitamins as well as pyridoxine and pantothenic acid. One capsule daily as a supplement more as a therapeutic agent Your pharmacy has DAYAMIN in bottles of 30 100 and 250 capsules If your patients don t like capsules, prescribe golden DAYAMIN LIQUID with the citrus-like taste—in bottles of 90 cc. 8 fluidounces and 1 pint. ABBOTT LABORATORIES NORTH CHICAGO ILLINOIS.

EACH DAYAMIN CAPSULE contains: Vitamin A, 10,000 units; Vitamin D 1 000 units; Thiamine Hydrochloride 5 mg.; Riboflavin, 3 mg.; Nicotinamide 25 mg.; Pyridoxine Hydrochloride 1 5 mg.; Pantothenic Acid (as Calcium Pantothenate), 5 mg.; Ascorbic Acid 100 mg.

SPECIFY *Dayamin*®

(ABBOTT'S MULTIPLE VITAMINS)

in conjugated form, certain enzyme-systems appear necessary to free that acid from its conjugation Other enzyme-systems block the action of folic acid by competing for certain essential molecules An example of the latter is drug food competition observed in the action of sulfa drugs Here, the drug competes with para-aminobenzoic acid, a vitamin essential for bacterial growth Blocking of the para-aminobenzoic acid molecule prevents synthesis of folic acid by the organism This process of action and counteraction is repeated thousands, perhaps millions of times in the body, depending on the supply or intake of many identified, and probably still more unidentified nutrients It becomes clear, therefore, why biochemistry is so clearly related to nutrition

If we translate the active principles of the various foods of the diet into quantitative requirements for oxidation and reduction processes, then various foods containing these active principles take on new meaning for the physician He can search more effectively for the nutritional component of illness among his patients

The purpose of this page will be to help physicians broaden their knowledge and stimulate their interest in nutrition Its policy will be to discuss thoroughly known facts about nutrition as well as beliefs and practices now prevalent which are not based on facts

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

In this issue the editorial board of the JOURNAL and the faculty of the School of Nutrition at Cornell University inaugurate a page entitled "Facts About Nutrition" Because the series of articles on this subject appearing in the JOURNAL in 1945 were received with interest, the editorial board believes that physicians will welcome a discussion of the newer concepts of nutrition The writers hope that this page will help to clarify much of the confused thinking on the subject and that it will arm physicians with a weapon for their day-to-day attack on disease and the prevention of disease

---

While the subject of nutrition, defined in general terms, requires a knowledge of caloric needs and essential nutrients such as vitamins, minerals, and protein, a more specific interpretation of the meaning of nutrition is required by the physician He must remember that nutrients are not usable to the body until they are in the blood stream Many conditions interfere with the absorption of nutrients from the intestinal tract. It is not infrequent for patients with a plethora of nutrients in their diets to become seriously deficient in essential amino acids, vitamins, or fatty acids because of inability to absorb these essentials into the blood stream In sprue there is defective absorption of fat which can lead to deficiency of essential fatty acids. Absorption of vitamin K is changed in gallbladder and liver disease, occasionally so insidiously that hemorrhage occurs before the physician is aware that prothrombin is depleted. In many of the severe dysenteries, in addition to water and electrolyte losses, essential nutrients are not absorbed. In surgery there are numerous examples of essential nutrients in the blood stream reaching low levels. The improvement in healing when protein intake is adequate has encouraged surgeons to prepare more patients for operation with whole blood and plasma. Likewise there is increased use of casein hydrolysates and vitamins postoperatively

The physician must know why essential nutrients and their utilization within the body are biologically necessary For example, in the combustion of glucose there are many requirements in addition to insulin The glucose molecule, by combining with phosphates, obtains free and fast movement from blood to tissue and back again This phenomenon is called phosphorylation The chemical changes in the combustion of glucose depend on enzyme and co-enzyme systems, which in turn require magnesium, thiamine, niacin, and riboflavin to function Thus it becomes clear why, in certain diseases, notably beriberi and pellagra, gross disturbances in carbohydrate metabolism are found. Many physicians are unaware that the diabetic patient likewise requires enzyme-system essentials as well as insulin before control of the disease is complete

In anemia, iron, amino acids, trace minerals, and folic acid may be involved It has been learned that there is a relationship between clinical classification and etiology Microcytic anemia is usually associated in our thinking with iron deficiency, while macrocytic anemia most frequently implies a defect in red cell production Nutritional anemia most often is associated with deficient protein intake. Studies of the effects of folic acid on macrocytic anemia have emphasized the phenomenon of biologic competition While most foods contain folic acid

in conjugated form, certain enzyme-systems appear necessary to free that acid from its conjugation Other enzyme-systems block the action of folic acid by competing for certain essential molecules An example of the latter is drug food competition observed in the action of sulfa drugs Here, the drug competes with para-aminobenzoic acid, a vitamin essential for bacterial growth Blocking of the para-aminobenzoic acid molecule prevents synthesis of folic acid by the organism This process of action and counteraction is repeated thousands, perhaps millions of times in the body, depending on the supply or intake of many identified, and probably still more unidentified nutrients It becomes clear, therefore, why biochemistry is so clearly related to nutrition

If we translate the active principles of the various foods of the diet into quantitative requirements for oxidation and reduction processes, then various foods containing these active principles take on new meaning for the physician He can search more effectively for the nutritional component of illness among his patients

The purpose of this page will be to help physicians broaden their knowledge and stimulate their interest in nutrition Its policy will be to discuss thoroughly known facts about nutrition as well as beliefs and practices now prevalent which are not based on facts

TROPICAL DISEASES OF THE GASTROINTESTINAL TRACT IN VETERANS

HOWARD B SHOOKHOFF, M.D New York City

(From the Tropical Disease Diagnostic Service, Bureau of Laboratories, Health Department, City of New York)

DURING the period of the second World War, there was endless discussion of the tropical diseases which returning service personnel might bring back home Numerous articles were published, all of a speculative nature The idea was current that we might expect widespread plagues of unfamiliar types at the end of the war Since this threat did not materialize, there was a rapid decline of interest in the tropical disease problem.

There have been few, if any, attempts to discover what actually has happened among our veterans with overseas service, with respect to tropical diseases. During the years 1945 1946, and 1947, approximately 2,000 veterans have sought the assistance of the Tropical Disease Diagnostic Service of the New York City Health Department. The resultant experience has given us some idea of the extent and character of the tropical disease problems among veterans.

As might have been expected, only a limited variety of diseases has been seen. The relative incidence of the various conditions is best observed in a group of 1 324 veterans examined during the sixteen months following V-J Day that is, ending December 31, 1946 Of these 1 324 four hundred sixty four or 33 per cent, had some form of so-called tropical disease The conditions found and the number of cases of each are shown in Table 1

TABLE 1 —TROPICAL DISEASES AMONG 1,324 VETERANS*

Disease	Number of Cases
Malaria	200
Amebia is	74
Intestinal helminths	67
Fil riasis	41
Dermatoels, probably i yeotis	38
Sp rue	22
Giardiasis	21
Schistosomiasis	3
Tropical eosinophilia	1

* The total number of cases in this table exceeds the number mentioned in the text, i.e. 464, because of the fact that in some instances a veteran had more than one disease

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Gastroenterology and Proctology May 19 1948.

A considerable portion of these cases represents problems belonging to the field of gastroenterology

Amebiasis

Amebiasis is the most important of the tropical diseases seen in veterans because of the fact that its incidence has been fairly high, that in many cases it has been difficult to diagnose, and that it may exist in asymptomatic or subclinical form for long periods of time Among a group of 260 veterans, previously resident in New York City, in whom stool examinations were done as a routine without any specific indication from the standpoint of symptoms, 27 were found infected with *Endameba histolytica*. This suggests that, after elimination of the many cases of amebiasis already detected and treated during the period of active service, more than 10 per cent of veterans with overseas service still have amebiasis The prewar incidence in New York City did not exceed 5 per cent and was probably considerably less In New York State, with about a million and a half of veterans, there must be at least 70 000 cases of amebiasis in ex-service personnel Some have been detected and treated, but the majority remain to be found

These infections are of importance not only to the veterans but also to the population in general. The disease can and does spread here It has been possible to examine contacts of only a few of the veterans found to have amebiasis. To date we have found eight instances in which the same infection has been picked up in household contacts in five of these it was the wife of the veteran who was the victim.

It is not generally appreciated that amebiasis is not essentially a diarrheal disease. Although diarrhea is a frequent symptom, it may be entirely absent in some cases. Abdominal pain is common and is often present without diarrhea. Not infrequently, constitutional symptoms such as fatigue and fever are noted, and they may

TABLE 2 —Summary of Symptoms in 82 Cases of Amebiasis

Symptoms	Number of Cases
Gastrointestinal	
Diarrhea with abdominal pain	28
Diarrhea without abdominal pain	20
Abdominal pain without diarrhea	11
Abdominal discomfort (no pain)	4
Blood in stools	13
Nausea	7
Vomiting	4
Constitutional	
Fever	13
Chilliness or chills	6
Fatigue	12
Weight loss	11

either dominate the picture or occur in the complete absence of any gastrointestinal complaints

I have analyzed a series of 112 consecutive cases of amebiasis in veterans seen during 1945, 1946, and 1947 In two instances, no history was obtained In 28 cases there were no symptoms Table 2 is a summary of the symptoms present in the remaining 82 cases

Thus, diarrhea was absent in almost half the cases A history of blood in the stools was obtained in only 16 per cent of the cases In 20 cases, or 24 per cent, there were no gastrointestinal symptoms at all

Actually, there is a tremendous variation in the clinical manifestations of amebiasis I have analyzed the last 30 cases in veterans with respect to the presenting symptom In 11 instances it had no relation to the gastrointestinal tract Two of these 11 cases came because of filariasis A history of abdominal pain was later elicited in both The remaining nine cases complained of fatigue, weight loss, backache, chills and fever, or a combination of such symptoms

Case 1 —The most unusual among this group of cases with constitutional symptoms only was that of a physician veteran, 32 years of age He had had three attacks of chills and fever within a month Examinations of the urine had shown pus, and cultures were reported positive for hemolytic Bacillus coli He had been given sulfonamides and streptomycin without result He had a history of amebiasis while in military service He had received what appeared to have been adequate therapy and no longer had any gastrointestinal symptoms Examination of the stools, however, showed Endameba histolytica trophozoites Following specific therapy with diodoquin and sulfasuxidine, he stopped having fever, his urine no longer showed pus, and urine cultures became negative He appeared to have had pyelitis complicating an otherwise asymptomatic amebic infection

Among the 110 cases analyzed, there were six with hepatic involvement One had a definite liver abscess, one had acute hepatitis, and the remaining four had low-grade hepatitis This gives an incidence of hepatic involvement of 5 per cent

Case 2 —The case of acute hepatitis was instructive It occurred in a veteran of the China-Burma theater, 30 years of age The diagnosis was suspected only during his third attack of chills and fever He had had two previous attacks which were called pneumonia During his third attack he was noted to have tenderness over his liver and signs of consolidation at the right lung base X-ray studies showed elevation of the right diaphragm but no pneumonia The attack subsided spontaneously, and cysts of Endameba histolytica were subsequently demonstrated in his stools. Despite a course of emetine and diodoquin, he had a fourth attack This was promptly cut short by the administration of emetine

It is important to recognize that amebic involvement of the liver is not necessarily progressive and does not always lead to abscess formation if untreated There may be recurrent attacks as in case 2 or a low-grade subacute or chronic form of hepatitis

The diagnosis of amebiasis is, of course, primarily a laboratory procedure Nevertheless, it is the clinician who orders the tests, and if he relies on the examination of casual stools only, he will frequently fail to receive a positive report from the laboratory no matter how well-trained the technician may be and no matter what concentration methods he may employ The examination of warm, purged stools is essential In the group of 112 veterans under discussion, casual specimens were submitted in 100 cases A positive result was obtained in only 37 of these, that is, 37 per cent Of 106 in which warm, purged stools were examined, a positive result was obtained in 96 cases, or 91 per cent Without purged stools a majority of the cases would have been missed

Intestinal Helminths

If we exclude schistosomiasis, which is a vascular rather than an intestinal infection, helminthic diseases of the gastrointestinal tract have been neither frequent nor important among veterans This is shown in Table 3

TABLE 3 —Incidence of Intestinal Helminths Among 1 550 Veterans

Parasite	Number of Cases
Hookworm	36
Ascaris lumbricoides	21
Trichuris trichiura	20
Strongyloides stercoralis	5
Taenia saginata	1

The reason for the low incidence of intestinal helminths is probably the fact that these infections were easily detected by simple routine methods, and, consequently, most of them were treated before discharge of the infected individuals from the armed forces Furthermore,

hookworm, ascaris, and trichuris infections do not persist very long in the absence of reinfection Most of them disappear within two years although some hookworm and trichuris infections persist as long as five years

In no case was a trichuris infection the cause of symptoms The ascaris infections were, likewise, all asymptomatic except for the passing of worms in some instances.

In only one of the 30 hookworm cases was there anemia In 20 cases there were no symptoms The remaining 15 cases had symptoms which were probably due to associated conditions, such as amebiasis, in the majority There were four, however in which therapy definitely relieved symptoms Three of these had complained of diarrhea and the fourth of undue fatigue.

Strongyloides stercoralis infections were associated with diarrhea in two of the five cases In the others there were no symptoms. It is important, however, to bear in mind that these infections may perpetuate themselves through autoinfection and may cause symptoms years later The larvae are apt to be missed if fresh stools are not examined Purged stools are, therefore, an advantage in detecting these infections as well as for finding Endamoeba histolytica

Schistosomiasis

A large number of casualties during the Leyte invasion of 1944 were not due to enemy action but to the attack of the forktailed cercariae of Schistosoma japonicum Hundreds of our troops were infected In the majority of cases, these infections were detected and treated during the year following the invasion The fact that some were overlooked is attested by a series of recent articles describing cerebral schistosomiasis in veterans In addition to these missed cases, the infection undoubtedly persists among some of those who were treated since therapy is by no means always successful The cerebral cases are more likely to be detected, since they produce dramatic symptoms. More attention should be paid however, to the late hepatic manifestations. Within the next few years we are likely to see cases of cirrhosis among veterans with untreated or ineffectively treated S. japonicum infections.

The clinical picture of this phase of the disease is illustrated by the following case

Case 3—J M aged 26 was with the Army Engineers during the Leyte invasion late in 1944. In April 1945 he began to have attacks of epigastric and right upper quadrant pain sometimes radiating to the right scapula and to the top of the right shoulder and the neck. In December 1945 and again in May 1946 he had attacks of jaundice, ushered in with moderately severe epigastric pain. The first attack had been called hepatitis in an Army hospital. I first saw him, at the request of his physician during the second attack of jaundice. At that time he stated that he had been having intermittent diarrhea with blood and mucus in the stools since February 1946 He also stated that, while still in the Army he had been studied for an eosinophilia of more than 70 per cent.

On physical examination he was noted to have moderate jaundice of the skin and sclerae. He had no fever There was no enlargement of the liver or spleen.

The erythrocyte sedimentation rate was 38 mm. in one hour The blood smear showed 40 per cent eosinophils Examination of a warm stool specimen showed no parasites or helminth eggs The jaundice disappeared rapidly Three weeks later, the sedimentation rate had dropped to normal that is 10 mm in one hour, but the differential white blood cell count still showed 40 per cent eosinophils The clinical picture suggested intermittent obstruction of the common duct but gallbladder x-ray studies by the patient's own physician were reported negative for stones. The possibility of echinococcus cyst of the liver was considered The Casoni intradermal test was positive and the complement fixation reaction doubtfully positive.

It was decided to observe the patient for a while. He continued to have epigastric pain and distress intermittently When we learned that schistosomiasis could give a positive Casoni test, I suggested that the patient submit a series of stools for testing specifically for schistosoma eggs. He finally did this in January 1947 The first four specimens were negative The fifth and sixth after sedimentation showed eggs of Schistosoma japonicum.

He was given two series of fuadin injections, totaling 95 cc., by his own physician After this he was almost entirely relieved of his dyspeptic symptoms, but he complained of being unduly fatigued. He was last seen February 3 1948 Seventeen stools had been found negative for eggs. He still complained of fatiguability and also of epigastric tenderness. His white cells were 10 400 per cu mm with 20 per cent eosinophils Liver function studies showed a positive delayed van den Bergh reaction and a positive cephalin flocculation reaction It was felt that he still had active schistosomiasis and a course of tartar emetic was recommended because fuadin has a high rate of failure especially with S japonicum

There must be similar cases still to be diagnosed All veterans with vague dyspeptic symptoms and a history of exposure to S japonicum should have repeated stool studies for eggs. This is especially true if they have eosinophilia, but it is important to bear in mind that, by this time eosinophilia may no longer be present.

Giardiasis

There were 21 cases of infection with Giardia lamblia. This infection would ordinarily have been much more frequent in a group of individuals exposed to the tropics. Since a large number of

veterans took quinacrine (atabrine) regularly as a malaria suppressive and since that drug is also effective against G lamblia, many cases were prevented or cured A few of those infected, however, had been on quinacrine suppression Perhaps some strains of giardia can survive 0 1 Gm of quinacrine per day Of the 21 cases, seven had no gastrointestinal or other symptoms referable to the infection Of the other 14, ten had diarrhea, three had other gastrointestinal complaints, and one had unexplained weight loss Giardia lamblia is definitely pathogenic, and these infections should be treated

Sprue

Sprue is a much neglected and poorly understood tropical disease In its well-marked, relatively advanced stages, when there are soreness of the tongue, macrocytic anemia, x-ray signs of deficiency disease, and a grossly fatty diarrhea, it is easy to recognize Little attention has been paid, however, to the diagnosis of the condition in its early and mild forms It was not possible for us to carry out a complete clinical investigation of most of the cases we saw The diagnosis was usually based on the presence of a chronic diarrhea with flatulence, plus the finding of microscopic evidence of a steatorrhea, especially the presence of fatty acid crystals, and the absence of evidence of bacterial, protozoan, or helminthic infection

The following case is one in which it was possible to obtain the results of a sufficient number of laboratory tests to substantiate the diagnosis It demonstrates that classical sprue has occurred in veterans

Case 4—W L C , aged 29, married, entered the U S Army in March, 1944 He served in the Philippines from December, 1944, to September, 1945, and in Japan from September to December, 1945 He had a good appetite during that period but disliked the manner in which food was served so much that he failed to eat a good deal of his ration In September, 1945, after eight months in the Philippines, he began to have diarrhea which had been almost continuous up to the day on which he was first examined, April 18, 1946 He had as many as eight stools in a day They were light in color There were no cramps, but much flatus accompanied the bowel movements Since January, 1945, when he returned to civilian life, he had lost 25 pounds, although his appetite was good and he was eating home cooking For some time he had noted that his tongue was sore He felt tired and weak For two or three months his ankles had been swollen, especially toward the end of the day

On examination the patient appeared undernourished His skin was pale There was atrophy of the papillae at the tip and sides of the tongue

FIG 1 Abnormal pattern in the small intestine actually simulated adhesions between loops Findings returned to normal after sprue therapy

FIG 2 Barium enema showing tremendous dilatation of the colon

The heart and lungs showed no abnormalities, and examination of the abdomen was negative. There was no distention nor edema at the time he was examined

His blood showed hemoglobin 90 per cent red blood cells 3,050 000, white blood cells 6 400 normal differential count. Color index was 1 2 In the smear the red blood cells showed moderate variation in size with a considerable number of macrocytes

Examination of the stool which included both a casual and a fresh purged specimen showed no ova or parasites The naturally passed stool was very acid in reaction to litmus, unformed and pasty in consistency and light brownish-gray in color It had the appearance of rising dough X ray and fluoroscopic studies of the stomach and small intestine were reported as showing rapid emptying of the stomach and small intestine, dilated duodenum with thickened mucosal folds and a disturbed pattern in the remainder of the small intestine suggesting a deficiency state (Fig 1) A barium enema showed tremendous dilatation of the colon 8 000 cc of the barium mixture were said to have failed to fill the entire colon completely (Fig 2)

After the ingestion of 100 Gm of glucose the blood sugar curve was flat. The fasting value was 72 mg per 100 cc., at one hour it was 83 mg , at two hours 66 mg , and at three hours 74 mg Blood calcium was 11 mg per 100 cc.

The patient made a rapid recovery on a low fat high protein diet and injections of crude liver extract. Six months after the beginning of therapy x ray examinations of the small intestine and colon revealed no abnormalities.

Discussion and Summary

Certain tropical diseases have been seen and are still being seen with some frequency in veterans. Two which are yet to be seen are leprosy and echinococcus disease From the standpoint of the gastroenterologist, the most important diseases are amebiasis and schistosomiasis. Simple examination of casual stool specimens is not sufficient for the diagnosis of these conditions Special laboratory procedures, specifically, warm, purged stools for amebae and special concentration methods for schistosoma eggs, will usually be required.

POLIO CHECKED BY DRUG

The chemical conquest of virus diseases, which range from the common cold to encephalitis, or sleeping sickness as it is called, is heralded by the discovery of a chemical that stops infantile paralysis.

A number of polio victims are said to be walking around today, thanks to the chemical, called phenosulfazole with trade name of Darvisul, instead of being paralyzed and crippled for life. The drug has been given to more than 70 patients already this season and several hundred will probably get it within the next two months.

The chemical is a modified and very peculiar and interesting sulfa drug It was developed by Dr Murray Sanders of Columbia University, College of Physicians and Surgeons and eight chemists of Lederle Laboratories.

First trials of the drug started on patients in Texas this summer after extensive studies with mice and monkeys showed what it could do and that it was nontoxic and therefore safe to use Just how many cases have been aided by the drug in the Texas trials will need to be determined by exhaustive tests upon the patients who seem to have had beneficial effects from the drug

There is plenty of the drug. It is being supplied to physicians, provided they can give reasonable assurance that they can accurately study the patients. This is necessary with any new drug while proper dosages are being worked out. Dr Sanders feels now that some patients should be treated more vigorously than others But this type of knowledge could not be gained without the trials now under way

Besides the problem of dosage, there is another reason for being careful that the drug goes only to responsible persons. This is that otherwise many patients who did not have polio might get it, instead of getting some medicine they did need.

Dr Sanders and Lederle had hoped to have news of the drug reach physicians through regular scientific channels before it became public knowledge but this was prevented by premature reporting His work was not done under a grant from the National Foundation for Infantile Paralysis, and was not reported to the recent International Poliomyelitis Conference.

There does seem to be a good chance that, due to the public attention focused upon this new chemical agent, even prior to scientific publication, more doctors will join those now evaluating the drug clinically Formal statements about the results will continue to be withheld until later The drug is reported to be in ample supply and there is a polio epidemic. For these reasons more progress in testing the new treatment will be made in the coming weeks than otherwise would be the case.

Meanwhile with an infantile paralysis epidemic in Texas and North Carolina and possibly spreading elsewhere facts about this important advance have been obtained and reported by Science Service.

There have been some failures with the drug. If motor nerve cells have been destroyed the drug cannot be expected to restore them But it can stop the progress of the infection to more nerve cells and can prevent deaths from polio

The unique feature of the drug that it can stop a virus disease, gives hope that this or other drugs can be made to stop other virus diseases.

Full details about Darvisul were reported at a New York Academy of Sciences conference on August 23 —*Science News Letter July 31 1948*

PILONIDAL CYST

JOHN C M BRUST, M D ,* Syracuse, New York, and JOSEPH B SARNER, M D ,** Philadelphia, Pennsylvania

(From the Graduate School of Medicine, University of Pennsylvania, and the Department of Proctology, Mt Sinai Hospital, Philadelphia, Pennsylvania)

THERE is as yet no standardized method for the attempted cure of pilonidal cyst The confusion of thought is certainly not due to lack of expressed opinions The articles written on the subject during the years 1942 to 1948 nearly equal in number the total literature prior to the war years If the recent war served no other purpose, it certainly should have made the American physicians aware of the disease However, it is feared that the conflicting opinions regarding proper surgical therapy have caused and will cause only bewilderment as to the safest, most economical, and most certain method of cure

Wartime surgery had as its basic principle the fastest possible conversion of a man from a patient to a fighter It took some years for the medical corps of the Army and Navy to realize that the rapid return of a man to active duty entailed methods of trial and error that, in some instances, violated fundamental surgical principles The really vast literature on pilonidal cysts which appeared in a few short years was, in our opinion, largely worthless We say this because no really large series of cases has been reported which answered the following salient question What was the percentage of cures irrespective of the method employed? In fact, we are unable to find any sizable series of cases reported with an adequate follow-up since the paper by Rogers [1] Instead of methods of proved cure of the disease, the recent deluge of articles points up various schemes of primary closure with claims of success based solely upon immediate good results, failing completely to report absolute cure based on a follow-up of the cases after a minimum period of even six months With no attempt to caricature such reports, we can refer to an article written by a surgeon who reports 120 patients in an active Army hospital and, by special suture and prolonged preoperative "sterilization," concludes that he obtained absolute healing in 92 per cent of all cases A true skeptic, and we count ourselves in the group, will ask the following questions To render the wound even remotely fit for primary closure, how much time was lost from duty? How long after this elaborate block excision and detailed layer by layer closure was the patient confined to bed? If a certain proportion developed immediate or delayed wound infection, did not the subsequent secondary surgery greatly raise the average time spent in the hospital and increase the average period of total disability? And, of greatest importance, why does this author talk of 92 per cent "cures" in men who, after leaving the hospital with a presumably healed wound, return to an active military status and cannot possibly have been personally followed after an adequate lapse of time, which is not a matter of days or weeks but of months? The proponents of primary closure claim in stentorian tones that a wound closed and solid and clean at the end of three weeks constitutes a cure However, we have had the personal experience of doing secondary operations on well over 200 cases in which, following presumed primary healing, the wound had remained closed, clean, and essentially asymptomatic for periods varying from two weeks to as long as eight months, only to break open and discharge pus

It would seem logical then to claim no cure until at least twelve months had elapsed from the day the patient was dismissed with a solidly healed wound Any results we report today are based solely upon this premise We present nothing original as regards surgical technic We will merely outline a simple economical surgical plan which has been utilized in a total of 1,014 cases This program was evolved in 1937 by one of us (J B) with the following objectives in mind (1) to perform definitive surgery with a minimum period of preoperative delay entailing disability, (2) to perform an operation with the minimum sacrifice of tissue consistent with adequate postoperative care of a granulating wound, and (3) to follow such surgery by a regimen of care which precludes pocketing, bridging, and delayed healing

The method we are describing is merely an exteriorization of the cavity and a careful unroofing of any branching tracts or pockets To this extent it is nearly identical with the proved, successful method of curing a fistula-in-ano Thus, the tract is opened from its origin to its termination, including all ramifying branches, the base of the tract is gently scrubbed out with dry

---

* Dr John C M Brust died on May 14

** By invitation

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Gastroenterology and Proctology May 19 1948.

gauze until it is obvious and certain that no small or large side tracts or pockets have been over looked and not exteriorized The edges of the wound are beveled in a conservative fashion so as to facilitate ease of exposure and redressing postoperatively and to avoid premature roofing

Pilonidal cysts presenting primary, acute, or recurrent abscess would appear at first glance to be hopelessly beyond the scope of the above outlined procedure It was the observation in five acute cases seen in 1936 that prompted a change in our surgical attack on this disease. It had been standard policy where frank abscess was present to establish adequate drainage, and days or weeks later to do a very radical block excision of the entire cyst together with any side tracts Instead of this mere incision and drainage, how ever we attempted to unroof completely the cav ity and to excise rather gingerly the overhanging edges. The necrotic base was wiped out with gauze, and the entire cavity was tightly packed with dry gauze This gauze was soaked out in forty-eight to seventy two hours and the result ing wound was then treated by gentle daily pack ing, flushing out the cavity, daily sitz baths, and other means of simple hygiene. We observed that all the five cases so treated granulated from the bottom, that they were completely healed within four to ten weeks, and that eight to twelve months later there was no evidence of recur rence.

This method of "drainage by unroofing" has been consistently employed during the ensuing twelve years. Other authors have reported this simple one-stage plan [2-4] We hasten to add a minor chronologic modification If a patient is seen in the office or hospital with an acute abscess immediate conservative buttonhole incision and drainage by insertion of a small strip of rubber tissue is done to relieve severe pain and prevent extension while awaiting admission to the operat ing room or as happens these days, to a hospital bed Such preliminary drainage is not a routine surgical policy, it is a matter of humane ex pediency

Prior to the adoption of treatment of pilonidal cyst and sinuses by conservative exteriorization we had employed in common with the basic technic of men experienced in this field the method of radical block excision Such excision usually resulted in a very large, deep but admit tedly clean wound The pathologic department would frequently state however, that the actual cyst measured perhaps 3 by 2 by 2 cm. but that the specimen submitted en bloc measured 8 by 5 by 4 cm. This excess tissue was normal skin, fat, perhaps muscle, and probably fascia The time consumed in producing firm, smooth solid healing was certainly excessive and eco nomically disabling The principle was sound, however, and, as regards recurrence rate, ad mittedly far superior to any other [1 5] The dis ability and protracted postoperative care caused surgeons to seek short cuts. Thus the student of the subject began to read of primary closure, partial closure, delayed closure, plastic flaps, sliding grafts special suture material or suture patterns, and, in the past decade the employ ment of sulfonamide compounds locally, sys temically, or both, and lastly, penicillin The surgical creators of these "short-cutting" methods failed to tell us how many of their patients healed and remained free of recurrence after a lapse of at least twelve months

In 1937 Buie described his method of treat ment by marsupialization or exteriorization [6] In his description he stressed the histologic charac teristics of the cyst lining He portrayed how the base could be left intact and how, by suturing to the inverted skin edges, this base could be utilized as an adequate substitute for actual skin This method appealed to us, and we began to em ploy it We soon found, however, that there were frequently mechanical difficulties. The drawings illustrating the technic in Buie's original descrip tion portrayed a beautifully simple, shallow cyst in a relatively thin individual Unfortunately, we noticed the following characteristics in most of our patients (1) The cyst was often tortuous, and in many instances the basic lining had been partially or even totally destroyed by recent gross infection. (2) The patients themselves were more often than not heavy set, muscular persons with thick skin (3) The cystic-lined or necrotic tracts were frequently deep (4) In chronic cases upon opening the tracts we en countered large amounts of scar tissue These findings greatly curtailed the ease with which the beveled skin could be approximated to the edges of the base of the cystic tract or tracts. When tension was employed to effect such approxima tion we noted increased pain skin edema, and, at times, suture sloughing We subscribe to the fundamental principle of exteriorization but find that total or even partial marsupialization by suture can be employed in approximately 40 per cent of the total cases.

The method we employ will be described briefly and illustrated by drawings sketched by the artist in the operating rooms. The patient is admitted one day prior to operation. A light supper is permitted and the preparation neces sitates carefully shaving the hair from a skin area outlined by the surgeon in indelible pencil This extends slightly above widely lateral, and well below the suspected boundaries of the cystic

tracts The anus is not shaved unless, as often happens, a tract is known or suspected to approximate or even encircle the anal margins No breakfast is given the day of the operation, and a simple water enema is ordered

Moderate preoperative sedation is administered After an extensive trial of various anesthetics, including pentothal sodium, inhalation, and even a short and discouraging test of local block, we settled upon low spinal in minimal dosage as nearly ideal With this the patient is spared pain, the field is not distorted, and bleeding seems to be minimal, speed is not necessary and disturbing side-effects are infrequent Local infiltration anesthesia is inadequate except in the very small, shallow, and relatively uninfected cases Inhalation or intravenous pentothal anesthesia with the patient in the inverted prone position is frowned upon by most anesthetists Respiratory difficulties are more common, and we have consistently observed that pentothal is accompanied by greatly increased bleeding from the open wound during the operation A low dosage spinal anesthetic is ideal except for the occasional postoperative "spinal headache" About ten minutes after the spinal anesthetic has been administered, the patient is moderately inverted in the prone position Adhesive strapping to the buttocks may be employed for purposes of exposure, if the surgeon lacks adequate assistance This adhesive tape should be removed when all the tracts have been opened their full length and depth The wound should not be saucerized or beveled with the straps in place since, to do so, results in removal of too much or, as more often happens, too little of the overhanging margins The following figures, with their accompanying legends, portray the steps employed in an average type of pilonidal cyst operation (Figs 1 to 7)

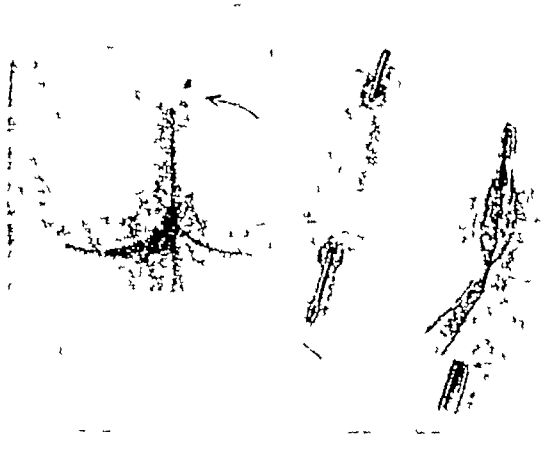

FIG 1 The tract is gently probed, and incision is made to unroof the tract. Infection does not prevent such unroofing

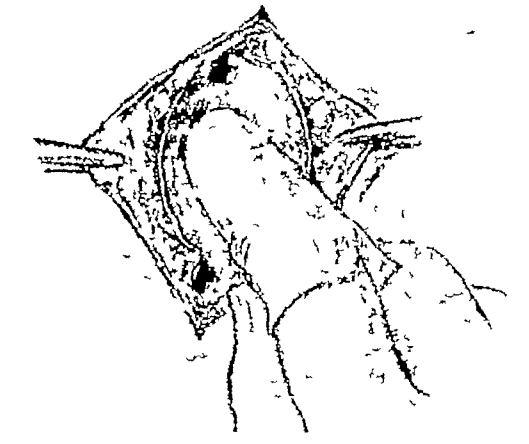

FIG 2 The open cystic tract and cavity is widely exposed, and the base is scrubbed clean with dry gauze Secondary sinuses, if present are quickly noted.

By leaving the base of the cyst intact, the need for hemostatic sutures is greatly diminished, thus producing a much cleaner wound in a much

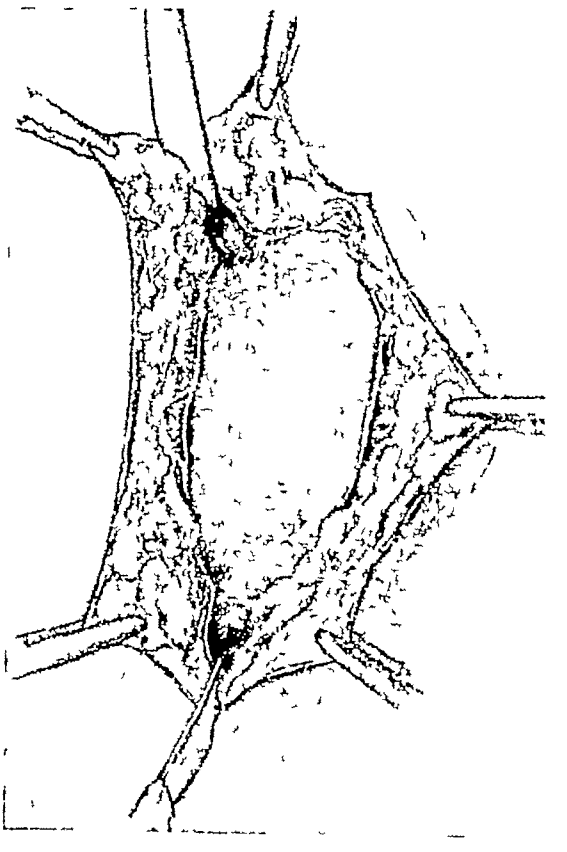

FIG 3 The secondary sinuses are probed, and further unroofing is performed

FIG 4. The tracts have been opened beyond their lateral and terminal boundaries. All traction is released, and conservative saucerization by beveling the skin edges is performed.

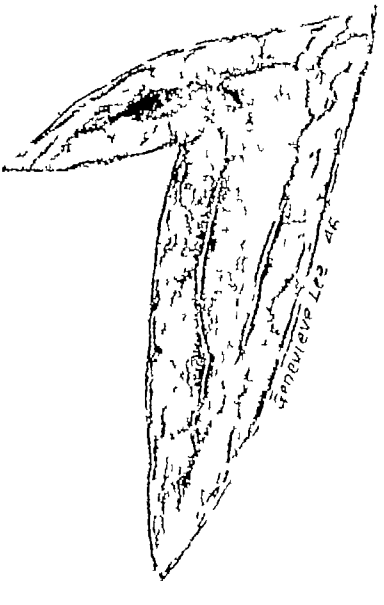

FIG 5 The completely opened and saucerized wound is carefully inspected. All bleeding vessels are ligated using #00 plain catgut.

shorter time. We agree completely with the thoughts expressed by Blaisdell in a recent article discussing the mechanics of healing in these wounds.[7] The beveling of the wound must be done on all sides, i.e., top and bottom as well as lateral walls. The deeper the wound or the more obese the patient, the greater the saucerization must be. We, too, believe it is failure to produce an easily exposed, easily dressed wound that is productive of not only delayed healing but residual sinus formation and the dreaded recurrence.

In almost all of the patients operated upon by us for so-called recurrent cysts, we noted the following features (1) The point of persistent sinus formation was found at the lowest angle of the scar (2) Of the operations we performed for recurrent cysts or infected sinus formation, 48 per cent followed attempts at primary closure 33 per cent followed partial closure with rubber drainage at one angle of the wound and only 19 per cent followed open operations with healing from the bottom up (3) Failure to obtain healing following open operation and packing of the wound resulted we felt, from inadequate postoperative care (4) Pathologic examination of the tissue from the base of these so-called recurrent cysts usually showed infected granulation tissue rather than a true epithelial-lined cyst wall

This would strongly indicate that such "recurrences" are mechanical, due to dead space faulty healing etc., rather than to the surgeon's having left cystic remnants. Upon completion of the operation, the wound is inspected in great detail Any suspicious area is probed, and where the slightest doubt exists, any pocket or sinus is opened and beveled. The use of dye or "chemical ferrets" in our hands was useless and not dependable. Such staining material seeps into normal tissue, obscures the field, and often fails to enter all the tracts due to blocking of such sinuses by scar formation

The wound is tightly packed with dry gauze held snugly in position by narrow adhesive straps The dressing is not disturbed for forty-eight to seventy two hours, and its removal may then be facilitated by soaking it to its depth with saline or a dilute peroxide mixture Upon removal of such a dressing a flat dry wound is usually observed Bleeding is minimal and blood clots at

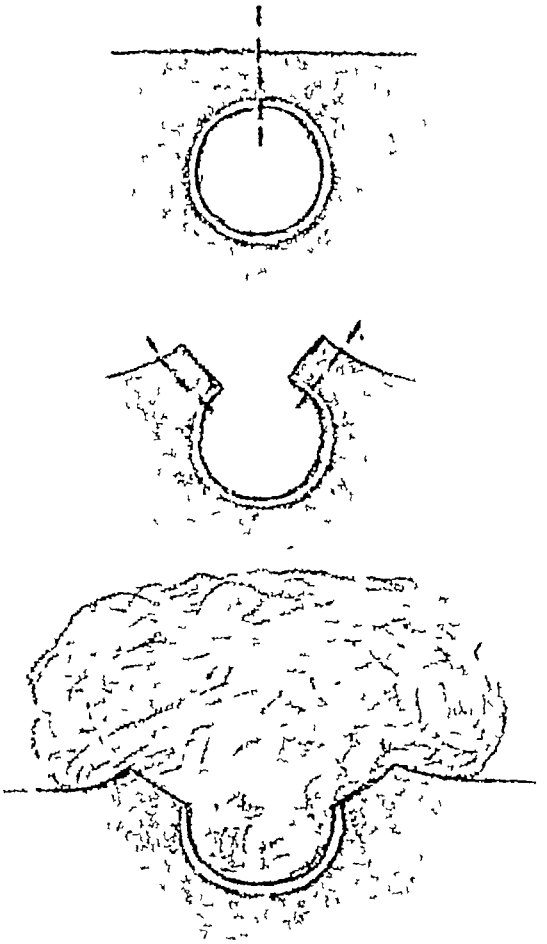

FIG 6 Schematic drawing of the basic principle and the method of packing

FIG 7 The appearance of the wound after approximately seven to ten days Such a patient should be fully ambulatory at this time and able to perform all but the most strenuous occupations or duties

the base are rarely noted Local medications, such as crystalline sulfonamides or penicillin are not employed If such a wound is properly created, infection is not a factor, and, with adequate aftercare, infection should never be a factor

The postoperative care of these surgical wounds is not complicated, but requires vigilance and constant inspection by the operator himself Before leaving the hospital, the patient, and, if possible, a member of his family is instructed as to the mechanics of healing and the need for cleanliness The wound is exposed, cleaned, and redressed as a demonstration The wound is kept flat, and every effort is exerted to prevent pocketing, transverse bridging, premature roofing, and overhanging edges The wound is dressed daily by the surgeon while the patient is in the hospital, and the patient or a member of his family is taught to dress it twice daily after returning home Hot tub baths or shower baths are encouraged beginning the day after the original packing is removed Many of the smaller shallow cysts appear so clean and dry that the patient may go home on the third or fourth postoperative day This is unwise, of course, in the larger, deeper wound In civilian life, however, it is very unusual to keep any patient in the hospital more than eight or nine days, even those patients with extensive wounds Similarly, many of the patients may resume work after as little as eight to ten days, and almost always within eighteen to twenty-one days The wounds will probably be open at this time, but if the surgery has been properly executed and the immediate postoperative care has been adequate, such wounds should be nearly flat, clean, and surprisingly painless If the patient's occupation involves riding a tractor or entails strenuous bending, squatting, etc , he must be warned prior to surgery that his disability may, for obvious reasons, be prolonged The patients return to our office every two to four days for the first three postoperative weeks and after that as seems indicated At these office dressings, the wound is carefully inspected,

trabeculations are gently broken down and exuberant granulations are destroyed Most important is the prevention of premature approximation of skin margins We have been greatly impressed with the need for keeping the outgrowing hair, which is often luxuriant, shaved back from the skin edges. This is particularly prone to be troublesome where the open wound extends well down into the intergluteal cleft. These hairs should be shaved away from the edges of the wound for a distance of 1/2 inch and such shaving should be done every four or five days until the wound is closed and healthy Here again a member of the patient's family can be of great aid.

Selection of Cases

In presenting results or drawing conclusions in any surgical procedure the surgeon should, in theory never base his figures upon selected cases The entire series should form such a basis. However, we feel that in fairness to the method described above and in the interest of accuracy, many patients' records must be discarded as statistically worthless. The reasons for this selectivity are obvious.

Military personnel, upon leaving the hospital, return to full duty in nearly all instances. Such patients may be taught how to care for the wound, but how well that is done is problematic During a period of forty-two months, we operated upon 640 men and women in the U.S Navy and Marine Corps The surgical approach varied in no way from that described above There was an average hospital stay in this group of eighteen and three-tenths days Nine of these patients required wound revision of a minor nature prior to their discharge from the hospital As regards the rate of cure, we will eliminate the entire group for one reason No follow-up was possible

A strenuous endeavor was made to follow all private civilian cases by personal inspection after a period of at least one year following dismissal from our care The total private cases numbered 220 and data are available on 211 of these persons. The rest could not be reached either in person or by questionnaire.

One hundred fifty four Veterans Administration patients were operated upon by us during the period from 1942 up to and including March, 1947 By personal inspection or by replies to a mailed questionnaire, accurate information is available in 91 instances. The remaining patients could not be reached or failed to answer or, in a rather discouraging number, the answers were clouded by irrelevant diatribes against the government, the armed forces, and the pension claims department of the Veterans Administration. To Dr V M Diodati Veterans Administration Liaison Officer to the U.S Naval Hospital Philadelphia, credit is due for his herculean efforts in locating these veterans and securing the follow-up data, such as they are

Data Based Upon Follow up Cases

There remain, therefore, 302 patients upon whom we base the following information

1 The average hospital stay was six and three-tenths days, with a minimum stay of three days and a maximum one of thirty-seven days

2 All but 20 patients were allowed out of bed twenty-four hours postoperatively and all but two were ambulatory in seventy two hours These two cases were very extreme wounds where we frankly admit adequate hemostasis was not obtained These were errors which should in no way reflect upon the method They reflect, instead, upon our surgical ability

3 In five patients, wound revision in the operating room was required either during the hospital stay or during the period of healing Again, we admit to errors in technic at the time of the original operation or to errors of omission during the postoperative period of healing We have arbitrarily named sixty days as the period during which such re-operation constituted a complication of convalescence rather than true recurrence or persistent failure to heal.

4 The period of time lost from work averaged thirteen and seven-tenths days with extremes ranging from five to fifty-one days.

5 The time required to produce a closed, dry wound averaged twenty-nine days in the group A few healed in as little as ten days Some persisted as rather indolent wounds for as long as sixty or more days Those failing to heal by sixty days, we count as surgical failures.

6 Failure to heal within sixty days or subsequent breakdown of the wound with sinus formation was noted or recorded in 16 instances. Using twelve months as the minimum period, no recurrence after such a lapse of time has been noted. Thus, the 16 failures result in a presumptive and probable curability rate of 94.7 per cent. This figure constitutes the outstanding reason for this presentation.

7 There were no deaths in this total series of 1 014 cases.

Conclusions

A simple safe surgical procedure which has been employed in a large series of pilonidal cysts is described The method of caring for the resulting wound is discussed, and the hazards of neglect are emphasized Statistical data concerning need for strict bed confinement, length of hospital stay loss of time from work, and the period required to establish complete healing are

reported, based on a careful review and follow-up of 302 operative patients after a period of at least twelve months A curability rate based on this same follow-up is computed to be 94 7 per cent

Discussion

F F McGauley, M D , *Schenectady* —The legal profession has a phrase known as "a nuisance case " In medicine, I believe, we have a similar situation in the treatment of pilonidal cysts During the past six years, this question has aroused so much interest that more papers have been written on this subject than the much discussed vagotomy, which is number two on the medical hit parade

Doctor Sarner and the late Doctor Brust are to be congratulated on their report of over one thousand cases Any man who reports one thousand cases on any subject speaks with authority

It is with satisfaction one finds such a low percentage of recurrences in pilonidal cysts The operation itself is very simple and almost foolproof, but I feel that 50 per cent of their success was due to their excellent pre- and postoperative care

After seeing so many postoperative cysts in my office, it occurred to me that I might analyze 50 of my own cases I thought it might require my work for a year or two, but, unfortunately, it was necessary to review the work for eight years, in order to dig out the 50 cases

In reviewing the relatively clean cases which were done by block dissection, it was found that the results were very satisfactory In the infected cases, we had a high percentage of recurrences, no matter what technic was used In infected cases, we tried both methods, one by block dissection, the other by incision and drainage with secondary closure One case recurred after three years The percentage of recurrence in any surgical procedure is a variable which depends on many factors

SCIENTIST FINDS BODY ABSORBS ONLY MINIMUM OF VITAL VITAMIN B_1

Apparently, vitamin B_1, taken in husky doses in the fond hope that it will give extra pep and energy, is not the potent builder-upper that the millions of vitamin eaters believe it to be

It might be, only the body does not absorb enough of it, according to a Northwestern University scientist Laboratory discoveries by Dr Theodore E Friedemann indicate that oral doses of more than 5 mg daily are largely wasted (5 mg are roughly equivalent to $^1/_{61}$ the weight of the average aspirin tablet) Furthermore, in contrast to other vitamins, the continued administration of thiamin (vitamin B_1) occasionally leads to development of an allergic response

Dr Friedemann is research associate professor of physiology in the Northwestern University medical school Published results of his findings are included in the current issue of the journal, *Gastroenterology* His investigations were conducted in the department of physiology of the medical school and the laboratory of the Abbott Fund in Passavant Memorial Hospital, Chicago, and were aided by the Clara A Abbott Fund of the University Associated with Dr Friedemann in the research were Thaddeus C Mcieciak, Patricia Keegan, and Bernice Sheft

Dr Friedemann's findings indicate that, although thiamin plays a dominant role in metabolism, and is a normal and extremely necessary constituent of animal tissue, including man's, the body either has developed no special mechanism for absorption of the vitamin, or even may have developed barrier mechanisms for thiamin in the intestinal tract, which probably were evolved to prevent the entry of substances harmful, or not immediately useful, to the body

His tests led the scientist to believe that thiamin belongs to that group of substances which are relatively poorly absorbed in the gastrointestinal tract, the maximum economical level of intake being about 5 mg daily

In his experiments, Dr Friedemann's subjects were administered varying doses of supplementary vitamin B_1 in addition to carefully weighed and controlled diets Destruction and lack of absorption of the thiamin were measured by examination in the laboratory of their bodily excretions Data collected indicate that at least several hundred milligrams of the following vitamins, differing greatly in structure from thiamin, are readily absorbed riboflavin, niacin, pyridoxine, pantothenic acid, and vitamin C These substances, like thiamin, are normal and necessary constituents of all tissues

Summarizing his findings, Dr Friedemann states "Intestinal absorption of thiamin chloride hydrochloride by normal human subjects is extremely limited The maximum which could be taken orally without an increase of fecal thiamin was about 5 mg per day, or slightly less than 2 mg , including thiamin in food, at each meal

"At a total intake of 5 1 to 5 2 mg per day, the urinary excretion (of vitamin B_1) was greater when the vitamin supplement was given with meals than when given one hour before meals Thiamin mononitrate was absorbed, excreted, and destroyed at rates similar to those of thiamin chloride hydrochloride "

DIAGNOSIS AND TREATMENT OF COLON POLYPS

GEORGE E BINKLEY, M.D New York City

(From the Memorial Hospital)

THE term polyp is applied to any pedunculated or sessile growth which protrudes into the lumen of the bowel and has the clinical appearance of a nonmalignant tumor Numerous types of polyps are found in the terminal intestinal tract. Each type has its origin in different tissues of the bowel Adenomas arise from the epithelium, lipomas from fat cells, fibromas from the submucosa or serosa, angiomas from the blood vessels, myomas from the muscularis or muscularis mucosae, lymphomas from the lymphoid tissue, and endometnoma from displaced endometrium, etc

Polyps may be found in any location within the large bowel They occur more frequently in the rectum and lower sigmoid and appear at any time from infancy to old age. The mucous or adenomatous variety is most common and will receive greatest consideration in this communication Adenomatous polyps are precancerous lesions which may undergo malignant change at any time. There are three clinical types of adenomatous polyps areas of hyperplasia, adenomas, and papillary adenomas

Areas of hyperplasia are small, sessile, slightly raised tumors which show only slight differentiation from the surrounding mucosa microscopically These areas are found frequently on the mucosa of the upper rectum and lower sigmoid in patients who present a toxic lower bowel and on areas of mucosa which have been exposed to irritation, such as the mucosa of a colostomy Areas of hyperplasia also are associated frequently with cancer of the colon and rectum.

The adenoma is the most common type of intestinal polyp It may be sessile or pedunculated The surface may be smooth or lobulated, ulcerated or covered with normal appearing mucosa Adenomas vary in size from a few millimeters to several centimeters in diameter They occur singly, in small groups and also in large numbers as a specific disease known as multiple polyposis in which the mucosa of the large bowel is studded with numerous adenomas

Papillary adenomas are much less frequently encountered than adenomas They occur chiefly in the old age group and are usually situated in the rectum and lower sigmoid We have not encountered a papillary adenoma proximal to the sigmoid colon Papillary adenomas are usually sessile but occasionally possess pedicles which are almost as large in diameter as the tumors themselves These tumors are soft and have a papillary or lobulated appearance

Adenomatous polyps are found in all sections of the terminal intestinal tract. A review of 307 cases revealed the following distribution the colon and rectum were involved in six cases, the colon in 133, and the rectum in 168 cases. The dividing line between the colon and the rectum is calculated to be 15 cm caudad to the anal skin margin

The frequency of occurrence is revealed by the findings at routine colon and rectal investigations of patients attending the Strang Cancer Prevention Clinic In a series of 2,012 cases, 188 patients, or 6 4 per cent, were found to have some type of nonmalignant polyp The incidence in men is higher than that found in women. In 894 women, 32, or 3.5 per cent, had polyps, while in 2,018 men, 156 had polyps an incidence of 7 7 per cent.

The histologic status as to benign atypical, and malignant qualities of adenomatous lesions varies widely We have yet to find any malignant tissue in the so-called areas of hyperplasia The papillary adenomas, which are limited chiefly to the rectum, will frequently show atypical and malignant change A review of 48 such cases, followed over a period of many years, revealed that 68 per cent of them had areas of malignant change, either at the time of the original treatment or during the subsequent years. Histologic examination of 96 adenomas revealed 64 to be nonmalignant, while 32 showed atypical or indefinite malignant change at the time the original biopsy was taken or at the time the polyp was removed The above figures as to malignant change in adenomatous polyps serve to emphasize the importance of recognition and treatment of all such polyps within the terminal intestinal tract.

Experience suggests that the present status of diagnosis of polyps of the colon is poor A fair percentage of patients with colon cancer present a history suggesting the presence of a polyp for years prior to the diagnosis of cancer Other patients with polyps that have not undergone malignant change present symptoms dating back for months or years prior to recognition. Improve-

Presented at the 14nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Gastroenterology and Proctology May 19 1948.

ment in the diagnosis of colon tumors and colon disease will take place when symptoms suggesting colon disease receive greater consideration by the laity and profession

Too frequently, minor symptoms of colon disease are completely overlooked by the family physician, and patients are forced to resort to the use of patent medicines for relief without any effort being made to find the real cause of the symptoms Symptoms produced by small polyps are indefinite Occasionally polyps without recognizable symptoms are found in a normal functioning bowel. However, in most instances, a careful history as to intestinal disorder will reveal degrees of abnormal function of the colon and rectum. Improper elimination and a change from normal bowel habit is common The amounts of abdominal gas and distress and rectal flatus are increased There may be attacks of diarrhea and constipation with the passage of dark or bright red blood from the rectum. One of the most important and common symptoms of colon polyps is bleeding from the rectum at irregular intervals Very often the bleeding is associated with an attack of diarrhea, the blood and diarrhea lasting for a day or two followed by an interval of freedom varying from weeks to months A history of irregular bleeding is always strongly suggestive of a polyp within the colon when careful proctoscopic examination fails to reveal sufficient anal and rectal disease to account for the blood Symptoms of pressure within the abdomen are not uncommon with large colon polyps A number of the larger variety also produce varying degrees of partial obstruction This obstruction is aggravated from time to time by degrees of intussusception Constant diarrhea or frequent stools with increased amounts of mucus, blood, and flatus, associated with varying degrees of anemia and loss of weight, frequently precede the diagnosis of multiple polyposis

Diagnosis is not difficult All polyps of the colon, with the exception of small areas of hyperplasia, may be demonstrated A careful physical examination may reveal a polypoid mass on palpation of the abdomen, while tumors of the sigmoid are occasionally detected in the cul-de-sac on vaginal examination The majority of sigmoid tumors may be diagnosed by sigmoidoscopic examination Tumors of the colon, proximal to the sigmoid, can be demonstrated by fluoroscopy, barium, and air contrast enemas

Proctosigmoidoscopic examination which constitutes the first step in investigation of colon polyps permits inspection of the anal canal, rectum, and lower sigmoid colon Sigmoidoscopes, measuring from 30 to 35 cm in length and of different diameters, are necessary The patient is placed in a position suitable for the passage of the instrument beyond the rectosigmoidal junction into the sigmoid colon Sigmoidoscopic examination not only permits direct vision of the polyp within the lower sigmoid but may afford valuable information as to any pathology situated at a higher location Blood and blood-stained mucus coming down from upper segments of the colon beyond reach of the end of the sigmoidoscope always suggest the presence of an ulcerating lesion higher up in the colon The exact nature of atypical polyps may be ascertained by taking a piece of tissue for histologic examination through the sigmoidoscope at the time of examination

Colon polyps above the apex of the sigmoid can best be recognized by roentgen-ray examination Such examinations are satisfactory only when the bowel is free of fecal material Two or more days of preparation are usually necessary for cleansing the sluggish colon Large polyps are easily recognized by the ordinary barium enema Small polyps can best be shown by means of air contrast technic The addition of tannic acid to the barium offers advantages in demonstrating these small polyps Pressure technic films over accessible parts of the colon and stereo plates occasionally add to the efficacy of this method Because of the possibility of error in interpreting the films of suspected small lesions, it is at times advisable to repeat the examination before making a definite diagnosis

Treatment or removal of colon polyps involves both minor and major surgical procedures Single, small, and medium-sized polyps with pedicles located in the lower section of the sigmoid may be successfully removed with an electric cautery snare Removal of polyps of the colon above the apex of the sigmoid necessitates a laparotomy The findings in each case govern the abdominal surgical procedure The latter may vary from colotomy to total colectomy

Cautery snare removal is suitable for most pedunculated polyps within reach of the sigmoidoscope The majority of adenomas lend themselves to this approach On the other hand, the papillary adenomas of the sigmoid colon are usually large, sessile tumors and seldom can be completely eradicated by this method Cautery snare removal through an electric-lighted speculum may be either an easy or difficult operation Removal of lesions above the reflection of the peritoneum is always associated with a moderate degree of danger Therefore, this operation should not be undertaken by those unfamiliar with snare removal technic and the hazards of this procedure Removal will be greatly facilitated by placing the patient in a position which renders the polyp most accessible for removal The selected position may be determined at the

time of the previous examination Caudal anesthesia permits a painless procedure and relieves the anxiety of the patient A bipolar machine with a coagulating current is quite satisfactory A type of snare which will permit taking a number of bites in rapid succession is necessary, as a number of adenomas must be removed by the piecemeal technic The size of the wire forming the snare is carefully selected for each case. The actual procedure of removal consists of bringing the polyp into direct vision at the end of the sigmoidoscope, placing the wire around the pedicle, connecting the current, and slowly cutting through the pedicle at the selected site A coagulating current of sufficient intensity, together with slow closure of the snare, will prevent bleeding.

All polyps situated above the reach of the sigmoidoscope, and a few of those located in the sigmoid require abdominal surgery for removal Preoperative preparation of patients for the removal of nonmalignant tumors is as important as preparation for resection of colon cancers In both instances, the lower bowel should be free of fecal material, and the general condition of the patient capable of withstanding radical colon surgery A period of five to seven days is usually sufficient for cleansing the colon and for adequate clinical and laboratory investigations. Longer periods may be required for cleansing toxic and sluggish colons and for the preparation of those patients who require an improvement in their general physical condition before operation The colon is cleansed over a five-day period by the administration of Epsom salts in doses sufficient to produce five to eight stools in twenty four hours, together with a daily colonic irrigation Preoperatively, patients receive liberal amounts of vitamins, intramuscular injections of liver, and other medication as seems advisable

The surgical procedures which are employed in a miscellaneous group of cases are colotomy resection of the right colon partial resection of the left colon and total colectomy The abdominal cavity is usually opened through a midline incision. Congenital adhesions and congenital deformities, which are not uncommon in these cases, may increase the difficulty of recognition and removal After a general exploration, the colon is carefully palpated, the polyp or polyps localized, and the extent of involvement determined Difficulty may be encountered in detecting the small soft, movable lesion. A good x-ray film available at this time facilitates the problem of detection. We have removed a single polyp from the sigmoid colon in two patients who had been previously explored with negative results

Colotomy is the procedure of choice in removing the majority of single polyps This operation is not difficult The polyp is located by the sense of touch The section of bowel containing the polyp is brought to a suitable position An intestinal clamp is applied to hold the colon in position and to avoid unnecessary soiling The field is carefully protected with abdominal pads. An incision 3 to 5 cm in length is made through the longitudinal band near the base of the pedicle Excessive amounts of mucus, when present, are removed by suction or sponging If necessary to bring the polyp into view, the edges of the bowel are retracted The polyp, when visualized, is picked up with a forceps and removed after tying the pedicle. The intestinal incision is closed with a double layer of sutures, and the colon is replaced to its normal position Two or more polyps situated in different sections may be removed in a similar manner at the same operation. Colotomy is well tolerated, provided there is no undue soiling Convalescence is short and comfortable, the bowels move on the fifth, sixth, or seventh postoperative day without aid of strong cathartics

Resection of the right colon is the method of choice for removal of very large single and multiple small polyps, located in the cecum, ascending, or proximal section of the transverse colon A large single lipoma of the cecum in one of our patients was removed in this fashion and on several occasions it has been necessary to do this resection for multiple smaller lesions The one-stage procedure with anastomosis of the terminal ileum to the transverse colon is usually employed The use of the Miller Abbott and similar tubes in the postoperative period has lessened the danger in a one-stage right colon resection Convalescence is short, and the patient usually leaves the hospital during the second postoperative week.

Large single polyps and localized areas of multiple adenomas when situated in the left colon, may require resection of a segment of the colon. Sessile, papillary adenomas, when located in the sigmoid are very suitable for segmental resection and end to-end anastomosis. Other types of single nonmalignant tumors, too large for colotomy, located at any site between the midtransverse colon and rectosigmoidal junction may be treated in a similar manner Large tumors associated with symptoms of obstruction and proximal bowel dilatation, are best removed by the Mikulicz type of operation. This multiple stage procedure is preferable also for eradicating ill-defined areas of multiple polyps. The double-barrelled colostomy permits careful inspection of both proximal and distal loops for remaining polyps and allows their removal before continuity of the bowel is restored

Multiple polyposis is a disease of childhood and

young adults Our experience with a limited number of cases suggests that there may be more than one type of this disease Experience has proved that all untreated patients with congenital adenomatosis will develop adenocarcinoma Therefore, the only treatment is colectomy Fortunately, the rectum may be retained in a group of patients when the polyps within the rectum can be removed or controlled by snare removal and fulguration Colectomy with removal of the rectum is necessary when the polyps of the rectum show atypical or malignant change Retention of the rectum is greatly preferred to an abdominal ileostomy, as the only handicap of the former is the increase in the number of stools Total colectomy with or without retention of the rectum in our cases has been carried out in two or three stages However, with present-day supportive measures in major surgery, it might be possible to reduce the hospital confinement by a one-stage procedure

All patients who have had polyps removed from the terminal intestinal tract should be kept under observation indefinitely The large bowel, once the site of a mucous polyp, seems to remain a fertile field for the development of more polyps and, occasionally, the return of one at the original site A check in the form of a careful history followed by sigmoidoscopy and roentgenographic investigations at regular intervals will usually afford early recognition of subsequent lesions

Summary

1 The majority of colon polyps are of epithelial origin They occur most frequently in the distal segments

2 The common clinical types of epithelial polyps are adenoma, papillary adenoma, and areas of hyperplasia

3 Passage of blood is the most common symptom Blood may be associated with attacks of diarrhea occurring at irregular intervals

4 Diagnosis is made by proctosigmoidoscopic and roentgenographic examinations

5 The majority of pedunculated polyps in the lower sigmoid may be removed by the electric cautery snare Inaccessible polyps of the sigmoid and those in the proximal sections of the colon are removed by abdominal surgery The operations include colotomy and partial and complete colectomy

Discussion

Chas Gordon Heyd, M D, *New York City*—The incidence of polyps of the colon and rectum is certainly higher than is usually supposed About 70 per cent are in the region of the rectum and rectosigmoid and are visualized by means of the proctoscope This is about the same distribution of malignant disease in that area Fully one third of the patients have multiple polyps, and there is a striking family incidence It has been assumed that 58 per cent of malignancies of the colon and rectum develop on or in polyps that have undergone degeneration Fitzgibbon and Rankin found 24 carcinomas in 13 patients, and I have found in my own personal experience four cases of two malignancies occurring in the colon where the presumptive evidence was that they were due to degeneration of polyps [1]

The symptoms of polyps are practically nonexistent until they become malignant Occasionally, a large polyp may produce pain and some symptoms of partial obstruction It is when the polyp becomes malignant that the symptoms ensue, and they are due to the change from a benign to a malignant condition The symptoms Dr Binkley has emphasized are alteration in bowel rhythm, presence of blood or mucus, intermittent passage of blood with long clear intervals, and, occasionally, abdominal pain The diagnosis is sometimes very difficult and requires persistent attention and interest upon the part of the consultant I am quite sure the routine proctoscopic examination of any series of consecutive cases would demonstrate a surprisingly large number of rectal polyps whose early removal, before malignancy had taken place, would effectively prevent the development of carcinoma of the rectum and rectosigmoid

A WORD TO THE WISE

The curious thing is that legislators—and for that matter people generally—seem to feel that tuberculosis is someone else's disease and is paid for by the victim and his family The idea is completely wrong Tuberculosis has to be paid for by society The only choice is how the bill will be paid—*Illinois Medical Journal, April, 1947*

A A MOVEMENT NOW INTERNATIONAL

Fifty per cent of inebriates who join Alcoholics Anonymous abandon drinking immediately, 25 per cent backslide once or twice, and 25 per cent are "improved," says A A Membership now totals 60,000 and is spread through the U S, England, South and Central America, and Australia—*Medical Economics, July, 1948*

RADICAL OPERATIONS ON THE HEAD OF THE PANCREAS

WILLIAM BARCLAY PARSONS, M D , New York City

(From the Department of Surgery, College of Physicians and Surgeons Columbia University and the Presbyterian Hospital)

DURING the past decade there has been a striking change in the magnitude of the operations being performed daily in all parts of the country This is due largely to the impact of the war years when, under pressure, there was a rapid advance in our knowledge of the various measures ancillary to more operative technic Fine-silk technic better anesthesia, the various chemotherapeutic agents, further understanding of the physiology governing the circulating body fluids and alterations in the chemical constituents thereof, and greater familiarity with the methods used to correct disturbances in the balance of the latter have led to the undertaking of operations undreamed of twenty five years ago

The confidence thus engendered in the feasibility of these procedures was well placed In creased practice in their performance has resulted in greater technical facility and hence lowering of morbidity and mortality Such operations as pneumonectomy esophagectomy, and splenorenal shunting those to overcome congenital cardiac defects, as well as radical operations on the head of the pancreas, are showing improvement in operative results similar to that previously experienced in goiter, gastric and colon surgery, all of which not so long ago were considered, and rightly so, as dangerous operations.

Cancer surgery however still labors under the handicap of an unknown factor, namely the extent of spread at the moment of operation Until we are in a position to know more about the why how, and where of cancer we are forced to subject individuals to a great risk for a possible greater gain

Cancer of the body of the pancreas can rarely be recognized at a time when it may be removed with any reasonable expectation of success Unfortunately, the same holds true with cancer in the head of the gland except when there is early involvement of the lower end of the common duct resulting in jaundice For the purposes of this discussion, because of similarity in diagnosis and treatment lesions of the papilla regardless of whether their origin be in duodenal mucosa or terminal common duct, will be grouped with lesions in the head of the pancreas arising so close to the common duct that jaundice is caused early in their development

The appearance of jaundice at an early stage in the development of the tumor is vital for successful treatment, because this may bring the individual to operation before the occurrence of lymphatic invasion or local extension through the capsule to the superior mesenteric vein or retroperitoneal tissue In the absence of jaundice pancreatic pain interference with the digestion of fat, or a palpable mass may lead to a diagnosis by exclusion However, the diagnosis in the vast majority of early cases will depend on determining what kind of jaundice is present.

Jaundice may be obstructive from a tumor or common duct stone, or nonobstructive due to hepatitis from infection, homologous serum virus, or cirrhosis. The differential diagnosis will be difficult in those cases where obstructive jaundice has been present long enough to result in liver damage or where there is concomitant cirrhosis In most cases, particularly if early in their course, the correct diagnosis should be obtained promptly if all measures are employed at once The direct and indirect van den Bergh tests may be helpful but cannot be relied on if not further supported by other evidence and, therefore, are seldom employed in our clinic We rely on history, the serum bilirubin level, the presence or absence of an enlarged gallbladder, cephalin flocculation, alkaline phosphatase, duodenal drainage, and occasionally, x-ray of the duodenum The fluid obtained by duodenal drainage is examined chemically for bile, microscopically for pigment granules cholesterol crystals, and red blood cells and by digestion If above a pH of 7 5 for pancreatic ferments

TABLE 1.—DIFFERENTIAL DIAGNOSIS OF JAUNDICE

	Hepatitis	Stone	Tumor
Alkaline phosphatase	−	+	+
Cephalin flocculation	+	−	−
Duodenal drainage			
Bile	+	−	−
Crystals	−	±	−
Ferments	+	+	+ (2 Ducts, 1 Duct)
Blood	−	−	+
Distended gallbladder	−	−	+ (80%)

Table 1 indicates the positive and negative findings obtainable in typical cases of the three important conditions associated with jaundice Pancreatic ferments will be found in the duo-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Gastroenterology and Proctology May 20 1948.

denum when a duct of Santorini is present, even though the main duct of Wirsung is blocked, and blood will be present if there is ulceration as is common with lesions on the surface of the papilla Occasionally by x-ray one will find an enlargement or distortion of the duodenal loop, or, and this is extremely important when present, a filling defect in the midportion of the descending limb caused by an ulcerated lesion around the papilla of Vater

These patients exemplify those problems in nutrition, protein metabolism, electrolyte and fluid balance, as well as liver and renal function, that have been the object of research for many years, and have been the subject of numerous books and papers The coexistence of jaundice, hepatic and renal dysfunction, malnutrition, and anemia, all of which may occur in these patients, imposes a number of physiologic handicaps which must be overcome if surgery is to be successful Of special importance are the problems derived from disturbance of the distribution of water, protein, and electrolytes between the three main fluid compartments of the body

Renal function, cardiac efficiency, and the status of the constituents of the blood can be determined while other tests are in hand, as it is neither necessary nor wise to wait until the diagnosis has been made and operation decided upon before instituting a number of other diagnostic and therapeutic measures that may be indicated in any event Blood examination on admission should include a complete count, hematocrit, clotting time, and grouping Routine urinalysis plus phenolsulfonphthalein excretion rate must be supplemented by an electrocardiogram and blood chemistry studies The latter should determine the electrolyte balance of sodium, potassium, chloride, and carbon dioxide, and the circulating total proteins, including the albumin-globulin ratio, and nonprotein nitrogen A fair approximation of the patient's electrolyte balance can be obtained by calculation of total base from the simple determination of plasma chloride and CO_2 concentration However, we have recently found that valuable supplemental data are provided through the direct measurement of plasma sodium and potassium with the flame photometer

These studies will indicate deficiencies to be corrected promptly Vitamin K will be indicated for prothrombin deficiency, blood transfusions for anemia can be supplemented by one of the amino acid preparations for hypoproteinemia when a high protein intake by mouth is impracticable or requires reinforcement Salt and sugar administration will be governed by urinary output and specific gravity when checked against the sodium, CO_2, and chloride levels in the blood in order to prevent either dehydration or overhydration Frequent determinations of the blood volume would be desirable could this be accomplished without the use of Evans blue dye, isotopes, or plasma, all of which have definite disadvantages when administered repeatedly The blood volume, including plasma and cell volume, should be measured shortly prior to operation to establish a base line and to confirm any improvement in status suggested by the appearance of more normal findings in blood chemistry tests in the later stages of preoperative preparation

Many patients with jaundice will show relatively normal levels of the constituents of the circulating blood but will have a considerable shift in the makeup of their blood volume as shown by a relative increase in plasma volume and decrease in circulating red cell mass, although the total blood volume may be nearly normal This increase in plasma volume is almost certainly accompanied by an increase in the intracellular fluid, which is a point of prime importance in the postoperative period What amounts to malnutrition edema may occur if the circulating protein has been maintained at the expense of the cellular protein, and, if potassium in the cell has been replaced by sodium, the greater osmotic pressure of the latter brings more water with each molecule, thus increasing the intracellular fluid Overenthusiastic administration of sodium chloride further accentuates this tendency toward edema, which will be further emphasized in the presence of anemia We have been greatly encouraged in recent months by the response of some of our patients to the judicious use of potassium chloride when the level of plasma K is below 3 0 m eq /l

The technical operative problem consists in, first, the excision *en bloc* of the cancer area with those structures whose blood supply will be unavoidably impaired thereby, and second, the reconstruction of a continuous alimentary tract including anastomosis with the biliary system and a new portal of entry for pancreatic secretion The operative procedure has been fully described by many authors as well as the writer and will not be detailed here because of the time limitation [1]

The postoperative supportive measures are directed toward nutrition and the restoration of proper fluid, protein, and electrolyte levels A complete score of intake and output must be kept as a daily balance sheet to avoid dehydration or, far more commonly, overhydration The intake columns should show what is taken by mouth, the amounts and kinds of fluids by vein or under the skin, and the output columns should show all drainage by nasogastric tube or vomitus, any return by the sump drain, and the total urine excreted The sheet should also indicate the

daily intake of protein, sugar, and salt and the laboratory data concerning urine specific gravity hematocrit, and blood levels of electrolytes and protein.

During operation the patient will have received 2,000 cc. of blood, which will be slightly in excess of the amount of blood lost, and perhaps 500 cc of glucose in saline Another 1,000 cc of blood or glucose in water may be given that night

Beginning with the next morning the total intake of fluids should be strictly limited to 2,500 to 3,000 cc., depending on the size of the individual The only exceptions would arise in patients who showed considerable losses of fluid from nasogastric suction or a fistula. Protein can be given by the use of one of the amino acid preparations or whole blood and sugar in saline or watery solution Great care must be exhibited in the amount of saline administered Frequent testing of the urine for specific gravity and of the blood for levels of sodium, chlorides, and CO_2 checked by blood volume study during the week, will determine the body needs in amounts and kinds of fluids. Small amounts of water may be allowed by mouth after one day Usually, the nasogastric tube can be removed by the third day, at which time most patients will accept the better part of a liter a day by mouth.

Just as soon as fluids are taken by mouth, those given parenterally should be reduced. It was of interest to review some histories of patients operated on during the war when, with shortened staff and pressure of work, the overadministration of fluids was almost automatically avoided Some of these patients received as low as 1,500 cc of fluid and made good recoveries After the war the enthusiasm for administering fluids returned Between the seventh and twelfth days after operation, we lost three patients with wet lungs, gastric dilatation, and a little fluid in the abdomen, these patients had received up to 4,000 cc daily of blood, aminoacids and other solutions, particularly saline, in an attempt to stabilize the hematocrit and serum protein levels This experience emphasized the danger of overhydration and the lack of definite information from the hematocrit and serum protein determinations alone In a recent case of a patient who was losing potassium in her drainage fluid and showing dependent edema in spite of limited intake and excellent output, the parenteral administration of potassium in Darrow's solution was followed by marked diuresis rapid subsidence of drainage, and a markedly increased activity of wound repair

It is in the analysis of follow up results that one enters a field of philosophic discussion where there are only a few facts One patient is alive, but with a nodular liver in her eighth year after operation One patient succumbed to another operation over three years after his pancreatectomy, and no evidence of tumor was found at autopsy It is hoped that some of our surviving patients now under the five-year period will continue to do well, as many of their specimens suggest adequate tissue removal Since the formation of a team eighteen months ago to oversee the preoperative preparation, to perform the operation, and to follow the postoperative course, we have done six of these operations with no deaths although the mortality rate in my own cases is 27 per cent

Simple short circuiting of the bile is certainly followed by longer life than when a radical operation is attempted in an unfavorable case. The apparently favorable case, in our opinion, is entitled to the chance of cure which is admittedly slim but cannot be disregarded The patients with a chance of cure are those with small tumors causing early jaundice and are, therefore as a rule the less impaired individuals

It is a formidable operation that no surgeon should undertake with only a casual acquaintance with the anatomy of the region. Accurate anatomic knowledge, preferably gained by a refresher course in the anatomy laboratory, including the performance of the operation on the cadaver the ability to use silk technic, expert anesthesia and a team to oversee in detail pre- and postoperative management are basic essentials for success in this procedure.

In conclusion it is emphasized that any adult with jaundice should be hospitalized promptly and have immediate steps taken to obtain as accurate a diagnosis as possible To allow such an individual to wait for three or four weeks in the hope that the jaundice will clear may result in just enough liver damage with its consequent effect on electrolyte and protein metabolism, to jeopardize a successful surgical result The radical operation is a formidable one the immediate shock of which can be handled Deaths which may occur after a week or so are due to physiologic disturbances that may be irreversible because of impaired liver and renal circulation but are often preventable by proper physiologic management during the postoperative period

We believe that it is fair to class this operation, from the standpoint of propriety with other radical procedures such as pneumonectomy The operation carries a definite mortality risk which should be not much above ten per cent whereas without operation the disease itself is 100 per cent fatal. We are convinced that as time passes there will be increased comfort for all survivors at the least, and at the best a number of cures that will compare favorably with the results of other operations of like magnitude that are now accepted as thoroughly justifiable

Discussion

Dr Frank Glenn, *New York City*—Dr Parsons' admirable presentation of radical operations on the head of the pancreas is complete and detailed The introduction of this operation by the Presbyterian Hospital group has marked a milestone in the treatment of lesions of the pancreas The mortality rate that accompanied the early operations has been reduced by the careful analysis of postoperative complications and deaths I agree with Dr Parsons that early hospitalization and proper diagnosis of jaundice is all-important if we are to receive these patients early enough to be ideal subjects for this extensive surgical operation Furthermore, I enthusiastically support his contention that the operation should not be embarked upon in the late stages of the disease where the operative mortality rate is extremely high and incomplete removal of the tumor more than likely

Some years ago at the New York Hospital, we reviewed a series of 38 patients with carcinoma of the pancreas who had either been operated upon or who had come to autopsy, and, therefore, had verified carcinomas of the pancreas We found in this series that the average duration of life between onset of the first symptom and death was slightly over nine months It seems to me that it is important to bear this in mind in selecting patients for radical surgery of the pancreas If the procedure is to continue in use, and I believe it will, the patients that we operate upon must produce a low postoperative mortality rate, and our operations must provide for a reasonable period of survival with increased comfort It is for this reason that the reporting of all cases of resection of the pancreas will enable us to evaluate the procedure properly We must be able to demonstrate a prolonged survival period, taking into consideration postoperative deaths as well as the degree of well-being and health achieved by those who survive

Further reduction of postoperative morbidity and, therefore, the mortality rate also depends in no small part upon a better understanding of electrolyte and water balance and our ability to meet any exigency, be it to increase the potassium ion or to replace a diminished blood volume Dr Parsons has properly emphasized the necessity of knowing exactly what the patient needs after such a radical operation, and the dangers of indiscriminate and uncharted therapy

I should like to make a plea at this time for one practice when a carcinoma of the pancreas is encountered by those not equipped to do a pancreatectomy, a cholecystostomy should be done to divert the bile to the exterior, rather than a short-circuiting operation which is almost invariably followed quickly by cholangitis Of course, when a radical procedure is not being considered, a short-circuiting operation is indicated

At the New York Hospital, our total mortality rate for resections of the pancreas for lesions in the pancreas, the ampulla of Vater, and the first and second portions of the duodenum is 27 per cent for a series of 22 cases Our mortality rate is rapidly decreasing with better understanding of the entire problem and the addition of modern accessories to surgery

With new procedures, such as those described by Dr Parsons, it is best that they be done only by those especially well equipped to do the work to prevent discredit being brought upon the procedure and thereby depriving certain patients of the only opportunity they may have to escape a fatal outcome

NEW FILMS AVAILABLE

The following films have been added to the Motion Picture Library of the American Medical Association and are available on a loan basis Moles and Melanoma (Navy Department), Plague Control (Navy Department), Clinical Malaria (Navy Department), Scabies, 1946 (British Information Services), Training of the Disabled (British Information Services), Surgery in Chest Diseases (British Information Services), Accident Service (British Information Services), The Medical Motion Picture, Its Development and Present Application (American Medical Association) The final sequence of this film is illustrated by a case of cancer of the thyroid with metastasis to the thigh. The use of the Geiger counter is demonstrated. Stitch in Time (Farm accident film for laymen)

Address your requests to Secretary, Committee on Medical Motion Pictures, American Medical Association, 535 N Dearborn Street, Chicago, Illinois

THE ROLE OF THE VAGUS NERVES IN THE MEDICAL AND SURGICAL THERAPY OF PEPTIC ULCER

ASHER WINKELSTEIN, M D , New York City

(From the Medical Department and the Surgical Service of Mount Sinai Hospital)

THE ultimate cause of peptic ulcer is as yet unknown, but it is probably a psychosomatic disease in most instances.[1] We believe that the immediate agent of the inflammation and ulceration is the acid peptic gastric secretion stimulated through the vagus nucleus and nerves We will confine our discussion to the role of the vagus nucleus and nerves in the ulcer problem and endeavor to demonstrate that they are in a hyperirritable state in patients with duodenal ulcer

Our early work proved conclusively that the nervous or cephalic vagus phase and not the chemical-hormonal phase of gastric secretion is increased in duodenal ulcer [2] Using histamine and bouillion to test the chemical phase we found no increase in the gastric acidity in ulcers over normals. However, sham feeding which of course, strongly stimulates the vagus reflexly did give a higher response in ulcer patients

In another series of studies, it was clearly shown that the nocturnal secretion of ulcer patients, representing the largest interdigestive phase of gastric secretion, is increased at least threefold in acidity and volume over that of normals.[3] With Drs. F Hollander and A. Cornell, we have carried out two series of studies in recent years which have convinced us of the correctness of these findings. Others notably Henning Chalfen, Valdes, Dragstedt, and Levin had confirmed this work. This observation is of fundamental importance and serves as a basis for two important modern medical and surgical advances in the therapy of peptic ulcer, i e the intragastric drip therapy and vagotomy Physiologists are in general agreement that the chief if not the only, stimuli for the night secretion are mediated through the vagus nerves

Recently Dr Manfred Hess and I completed a study of the irritability of the central dorsal vagus nucleus [4] This study was made possible by the following procedure If a marked hypoglycemia under 50 mg per cent is induced by 15 or 20 units of insulin given intravenously it is followed by an increased secretion of hydrochloric acid in the stomach This response measures the vagus nucleus irritability since it is definitely a central and not a peripheral reaction.

The proof of this is the fact that complete vagotomy or atropinization abolishes the gastric secretory response. The juice produced is highly acid and peptic and thus is similar to the typical vagal sham feeding juice Since we already had evidence that the response to sham feeding and the night secretion were increased in ulcer patients, we decided to study the function of the vagus nucleus in ulcer patients and controls with the use of insulin hypoglycemia as a test and the gastric acidity response as a measure. We used ambulatory uncomplicated duodenal ulcers and normal controls and also repeated tests in the same patients in many instances

We may summarize these studies by stating that both large (15 units) and small (5 units) doses of insulin given intravenously provoke a markedly higher acid response in duodenal ulcers than in normals. This seems to establish that the central vagus nucleus is hyperirritable to drops in blood sugar in ulcer patients. The evidence obtained from sham feeding and from the study of the nocturnal secretion suggests strongly that, in general, it is hyperirritable in ulcer patients.

It now seems necessary and desirable in ulcer therapy to turn our attention from the peripheral vagal activity usually attacked by the use of diet, alkalis, and the atropine group of drugs to the central vagus nucleus. Whether psychotherapy, central sedatives, shock therapy or some other methods will help to allay the vagus nucleus hyperirritability will we hope be disclosed in future studies. In any case insulin hypoglycemia now offers us an objective method of studying this central irritability It may indeed prove very difficult to change this irritability Repeated insulin tests in the same patient using various pharmacologic agents have failed to alter the acidity curves They seem strongly fixed for the given individual Tetraethyl-ammonium chloride seems promising in some preliminary studies, but this is admittedly a peripheral stimulus.

Another study which has some bearing on our subject is that of the persistent postoperative free acidity in 45 per cent of duodenal ulcer patients who have had a partial gastrectomy [5] Our studies revealed that this free acidity is readily provoked by sham feeding and completely abolished by atropine Once again we are forced to lay the blame for this unpleasant situation (since recurrent ulcer is frequent in this group) on the vagus nerves. Twenty years ago because

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Gastroenterology and Proctology May 20 1948.

of this finding, Berg, Klein, and I added anterior subphrenic vagotomy to the operation of partial gastrectomy for duodenal ulcer with a high preoperative free acidity [5] We obtained the strikingly good result of 76 per cent postoperative achlorhydria and no recurrence in that group

Five years ago, Dragstedt advocated complete bilateral vagotomy alone or combined with gastroenterostomy for the cure of peptic ulcer [6] We will return to that procedure later in the discussion

We have now stressed the importance of the vagus nerve and its central nucleus in the pathologic physiology of peptic ulcer Increased vagal irritability not only accounts for the increased day and night acid peptic secretion, but it seems highly probable that it also leads to increased peptic and motor activities and to hyperemia

What are the practical implications of these studies for ulcer therapy? Psychotherapy, central sedation, alkalis, atropine, and dietetic therapy are definitely indicated However, we found fifteen years ago, that all of these do not give us an adequate control of the harmful increased night secretion Even aspiration before retiring is of no avail We have, therefore, instituted and carried out during the past sixteen years the continuous intragastric drip therapy with milk-soda solution or diluted alumina gels, chiefly in refractory cases and usually at night [7] This has given us splended neutralization (pH 3 5 to 4 0), rapid healing, long remissions, and, most important, good results in patients who were refractory to the conventional Sippy type of therapy To date, we have found no other medical method of controlling the night secretion

As already noted, Dragstedt confirmed our findings concerning the night secretion He has based the operation of complete vagotomy chiefly on the fact that vagotomy is followed by a marked reduction in the acidity and volume of the gastric juice during the night He has recently reported an excellent result in a series of 417 cases of duodenal ulcer treated with subphrenic vagotomy, alone in most cases, and combined with gastroenterostomy in some obstructing cases

Our surgical group at the Mount Sinai Hospital, Drs R. Colp, P Klingenstein, and L Druckerman, have performed vagotomy, alone or in combination, in 126 cases to date These cases have been studied physiologically by F Hollander and clinically by V Weinstein and myself

Summary and Conclusions

In summarizing our experience with vagotomy we would like to state the following

1 There is rapid loss of pain and rapid healing which bears no definite relation to the completeness of the vagotomy as judged by Hollander's insulin test

2 We favor partial gastrectomy combined with vagotomy, since it gives the least motor disturbance and the highest percentage of postoperative nocturnal achlorhydrias (94 per cent)

3 We regard gastroenterostomy plus vagotomy less favorably and more in the light of an experiment

4 We are opposed to simple bilateral vagotomy alone because of recurrences and untoward symptoms resulting from the vagotomy

5 There is also the remote possibility of some future harm from interruption of the vagal supply to the other intra-abdominal organs

6 There is also the possibility of complete return of vagal function after several years Time and future studies alone will decide this

In conclusion, I wish to emphasize again that our studies suggest the idea that, irrespective of the ultimate course of ulcer, the vagus nucleus and nerves play a central role in the ulcer problem Medically, intragastric drip therapy is of considerable value, and, surgically, vagotomy seems important in the attack on the vagi Furthermore, our studies indicate that new and future therapeutic attacks should be directed chiefly toward allaying the hyperirritability of the central vagus nucleus

Discussion

Harry L Segal, M D, *Rochester*—Dr Winkelstein has emphasized the effect of stimulation of vagi nuclei upon the stomach through the vagi nerves, regardless of whether a conscious or subconscious conflict in a basically dependent person or some other mechanism is the cause of the central stimulation

In most patients with peptic ulcer, neutralizing substances, whether milk or otherwise, plus other well-known measures, are successful in healing the ulcers For controlling the night secretion, there is no doubt of the efficacy of the Winkelstein drip Unfortunately, it cannot have the wide usage it deserves, as it is not always a practical procedure in the home

Barring mechanical effects we might be able to heal medically many ulcers which now require surgery, if we were able, by some drug, to prevent the excessive psychic gastric secretion resulting from overstimulation of the vagi nuclei, i e, if we were able to perform a "medical vagotomy" of those branches of the vagi which supply the stomach This effect, however, can be attained by surgery by means of the operation called vagotomy

Since the latest and most thorough vagotomy era initiated by Dragstedt and his associates in 1943, the question in ulcer patients requiring surgery is whether we should continue subtotal gastrectomy, which to date has proved to be the operation of choice, whether we should merely sever the vagi alone, or whether we should combine vagotomy with

operations such as pyloroplasty gastroenterostomy, or subtotal gastrectomy

Subtotal gastrectomy although very successful, is a mutilating operation Transabdominal-supra diaphragmatic vagotomy is less dangerous and less mutilating than subtotal gastrectomy We realize that vagotomy produces motor disturbances in the gastrointestinal tract in a certain percentage of patients. This is also true in a few patients subjected to subtotal gastrectomy Furthermore, if vagotomy alone eventually proves to have detrimental effects upon other organs such as the liver pancreas etc. surely subtotal resection added to it will not eliminate them. It also does not appear advisable at this time to add the unknown factors of vagotomy to such a successful procedure in order to eliminate a marginal ulcer which occurs in less than 5 per cent after resection. If necessary the vagotomy can always be done later in that small group On the other hand if vagotomy alone should fail to prevent or cure ulceration in a few individuals a subtotal gastrectomy can also be performed later It is for these reasons that our surgeons have not chosen to combine vagotomy with subtotal gastrectomy for a primary duodenal ulcer It is generally agreed that a vagotomy alone will heal an ulcer which has occurred after subtotal gastrectomy gastroenterostomy or pyloroplasty

Since vagotomy alone results in distressing gastric stasis diarrhea, or so-called sewer odors in some patients a drainage operation other than resection is now performed by many surgeons in addition to the vagotomy A well-constructed pyloroplasty in the correct circumstances is more physiologic than a subtotal gastrectomy or gastroenterostomy The mucosa gastroscopically approximates the normal more frequently after pyloroplasty In some cases however the situation of the ulcer or the condition of the patient will make a gastroenterostomy a much safer procedure than either pyloroplasty or subtotal gastrectomy Vagotomy can readily be combined with it.

Even if vagotomy should prove to be effective on a permanent basis without untoward disturbances, there are certain ulcer patients in whom it is contraindicated. It should not be done for acute or impending acute perforations (the ulcer can perforate before the healing effect of the vagotomy can occur) for acute hemorrhage where, in the rare case surgery is necessary to stop bleeding in the psychopathic personality in whom ulcer is merely an incident and not threatening life or in gastric ulcer because of the inability to differentiate with absolute certainty between a benign and a malignant gastric ulcer

If a gastric ulcer case fails to heal medically within a short time it requires a subtotal gastric resection. Two exceptions have been mentioned by Dr Dragstedt. If the gastric ulcer is so high on the lesser curvature that a total gastrectomy will be necessary we can wait six weeks to learn the effect of vagotomy before subjecting the patient to a total gastrectomy This operation as is known results in a higher mortality and morbidity than subtotal resection If a gastric ulcer associated with an active duodenal ulcer does not heal medically the chance that the gastric ulcer is malignant is less than 1 per cent If for some reason such a patient is thought to be a poor risk, he can first be subjected to vagotomy with the understanding that a resection will be done if necessary

Vagotomy, either alone or combined with any other procedure is still in the experimental stage. In time more facts will accrue and we shall learn which of these operations is best for each particular situation as has already been realized in the case of the marginal ulcer

Asher Winkelstein, M D., *(Closing)* —Dr Segal has criticized the intragastric drip therapy characterizing it as *'impractical'* I would like to state that I have treated several hundred patients easily and successfully with the drip therapy Most patients take the soft latex tube easily since chronic ulcer patients are usually tube broken. The eagerness of my ulcer patients to take and continue the drip therapy may argue for a psychoanalytic implication or for a desire for pain relief which the drip affects so rapidly and completely If the treatment is induced gradually one or two hours the first and second day usually by the third day the patients take it easily themselves, either in the hospital or at home

I consider drip therapy of great importance and, therefore will take a little extra time for its discussion As I see it 75 per cent of uncomplicated peptic ulcers go through life with mild symptoms. Almost any form of therapy will relieve these patients However 25 per cent are refractory and comprise the so-called intractable group who often fall into the hands of eager surgeons. You will find if the intragastric drip therapy is used—and usually it is only necessary at night for a few weeks—that these refractory cases will lose their symptoms and heal quickly We have recently reported good results with the drip therapy in a group of 69 such cases. This is the real importance and great value of the continuous intragastric drip therapy This is now being generally realized throughout the country by experienced therapists.

We are not in favor of Dr Segal s idea of performing a subtotal gastrectomy alone first for duodenal ulcer and reserving the vagotomy if and when a recurrent jejunal ulcer occurs. The addition of vagotomy to subtotal gastrectomy is a simple and short procedure it increases the postoperative achlorhydrias to approximately 90 per cent and has shown no untoward symptoms to date in our series. This prophylactic vagotomy is better than the therapeutic vagotomy added later for a recurrent jejunal ulcer since in the latter instance, while it is successful in the majority of cases we have had failures and recurrences with that method of approach.

THE CONSTITUTIONAL APPROACH TO MEDICINE

IAN P STEVENSON, M D , New York City

(From the Department of Medicine, Cornell University Medical College)

DISEASE is a departure from normal function in the human organism It is not a new and parasitic life imposed on the patient from without but is his own life in altered form In the words of Rudolf Virchow, "The subjects of therapy are not diseases but conditions We are everywhere only concerned with changes in the conditions of life Disease is nothing but life under altered conditions" The disturbed function is the result of the interaction of forces, the algebraic sum of which is the disease we study Disease does not occur without a patient, and the factor common to all the diseases which beset him is the individuality of the patient himself

Some diseases appear to arise entirely from intrinsic deviations of the patient himself Such conditions as congenital heart disease and the inborn errors of metabolism belong in this group Others, such as severe physical injuries, seem to be governed entirely by the nature and severity of the external forces involved Actually, if the disease picture is considered dynamically, both factors must be understood in all diseases The longevity of the patient with congenital heart disease may be closely contingent upon the circumstances of his individual environment, just as the survival of a patient with a severe bullet wound may depend upon his innate ability to withstand loss of blood and resist the encroachments of infection If this is true even of these two extreme examples, it is far more applicable to the vast majority of diseases in which a delicate interplay between environmental and intrinsic factors determines the eventual outcome of the condition All disease (D) may therefore be considered to be composed of two variable components, the external (E) and internal (I) factors, so that $D = E/I$ If the numerator is large, the denominator need be slight or absent for the full development of the disease When we are concerned with a bullet through the heart or heavy exposure to carbon monoxide, we may reasonably neglect the individual factor But these are circumstances which produce almost instantaneous death by overwhelming assault In every condition in which death is not immediate and the course is prolonged, we must, perforce, consider the intrinsic factors involved in the pathologic process

If the denominator or individual susceptibility to the disease is great, the numerator need be correspondingly slight This is true even of the same disease in different people Thus, certain persons have a predisposition to tuberculosis and will incur this disease upon comparatively slight exposure to tubercle bacilli Others have stronger resistance, but no one is completely immune, since, if the exposure is great enough, it will overcome the resistance of anyone This individual component is present in all diseases, even when the extrinsic factor seems to be most clearly defined The individual resistance to similar vitamin deficiencies or industrial toxins varies as widely as does the individual susceptibility to tubercle bacilli, although the fact is not generally recognized Life insurance actuaries tell us glibly that of 100 people 25 will die of heart disease, 15 of cancer, 10 of hypertension and so on, but who can tell us which persons are likely to die of each disease? This is obviously governed by individual factors with each person, and it is the function of medicine to determine these factors Until this has been accomplished, preventive medicine will be restricted to the control of environmental forces and thus be correspondingly inadequate

The individuality of the patient is paramount, not only in the predisposition to disease but in the resistance to manifest disease It has been shown, for example, that if one of homozygotic twins has pulmonary tuberculosis while the other remains healthy, the prognosis in the afflicted twin is better than it would be if both had the disease [1] In the former case, heavy exposure temporarily overwhelms transiently lowered resistance in one with basically good resistance, on the other hand, if both twins are affected, the innate resistance is less initially

The importance of individual factors in the outcome of disease may be further illustrated by considering the case fatality from pneumonia Before the advent of chemotherapy, when this condition was treated without specific therapy, the case fatality rate was approximately 25 per cent, today it is about 7 per cent in most series of cases The sulfonamides and penicillin have thus reduced the case fatality rate by 18 per cent, a remarkable achievement Its very magnitude has, unfortunately, blinded many physicians to the fact that without any therapy worthy of the name 75 per cent of the patients formerly recovered and today 7 per cent still die despite the therapy used It is not possible to maintain that the outcome in these patients is determined by the virulence of the bacteria involved, since the disease has different outcomes in patients whose sputa contain bacteria of

apparently the same type and virulence The truth is that in 82 per cent of all cases of pneumonia the prognosis is determined, not by a wonder drug or a particular diplococcus, but by the intrinsic factors of the patient himself This is the situation in a disease which it is common to consider most completely under the dominance of the scientific physician.

These determining factors are spoken of collectively as the resistance of the patient. Physicians of a former generation were accustomed to consider them as much as they were able, and their remarkably accurate prognoses were based largely on their understanding of the patient's individuality Unfortunately, the course of modern medicine has led physicians away from this individuality to the detailed consideration of the environmental forces which prey on man The development of bacteriology and the great extension of the basic sciences in the investigation of disease has promoted the notion that illness is something dissociated from the patient himself The physician tends to discuss his patient's pneumonia or hypertension as if he were considering the cut of his clothes The practice is further encouraged by the habit of diagnosing in terms of syndromes and clinical entities. It is, therefore, not surprising if the patient himself objectifies his illness and looks upon it in the manner of a botanist considering mistletoe growing on an oak tree. The skilled botanist, however, is aware of the fact that mistletoe shows a predilection for the oak tree and apple tree but not for the elm or maple Likewise, the conscientious physician must be increasingly concerned with the individual factors of resistance in his patients. There are many physicians who genuinely believe that such factors are beyond the scope and powers of medicine, that they are too subtle and erratic for our discernment. Indeed, some even hint that the very attempt to analyse them smacks of dangerous mysticism. Such pessimism is unjustified there is no reason for believing that the study of the patient himself need be less scientific than the study of the extrinsic factors of his illness They are not it is true, amenable to investigation by the usual methods of the laboratory but that does not detract from their scientific validity The dangers of superstition are likely to be much greater when these intrinsic factors are ignored than when they are studied The simplification of medicine by the assumption that pneumonia in a patient is the same as pneumococci in a test tube will only retard its progress in the end

The study of the intrinsic factors of disease is best known by the name of constitutional medicine The constitution may be defined simply as the totality of the patient as an organism The term has been restricted by some to subsume only the factors of genetic origin which compose the genetic constitution or genotype of the individual [2] The genotype, however, is altered by other factors, the study of which is equally important On the one hand, it may be modified by the environmental or paratypical factors acting upon the patient throughout his life Thus a man may have a genotypical tendency to a medium body weight but a sedentary occupation, and a wife whose hobby is good cooking may amplify the original design to the point of obesity The genotype may also be altered by forces brought into play by the patient himself Determinists will deny the possibility of this, but it seems reasonable to consider separately those things which a person does for himself which counteract his genetic tendencies and environmental forces His chromosomal legacy may tend to impose obesity on a patient who may yet achieve thinness by self control A man who is naturally choleric in temperament may learn to control his emotional debauches. The genotype then is modified in varying degrees by these paratypical and idiotypical factors. The person who results from the interplay of these elements is the phenotype, the individual whose study is the interest of the constitutionally minded physician

The most important aspect of the constitution is its wholeness, for the patient is obviously greater than the sum of his bodily and mental organs The student of constitutional medicine constantly stresses this holistic concept of the organism and deplores the current approach to the study of human beings as a congeries of viscera Unfortunately the wholeness of the person can never be described adequately in words, it is never even completely known but only sensed in varying degrees according to the perception of the physician. It is probably best studied and described by a knowledge of the reactions of the whole organism to different external stimuli Individual aspects of the constitution may however be described adequately and often quantitatively This division into parts is necessary for the study to be made at all, it is permissible if we remember that the whole organism is composed of the different fragments analysed and, what is more important that these fragments are all modified by the totality of the organism They are as much a result as a cause of this wholeness

The particular investigations of the constitutionally-minded physician are designed to assist him in the detection of those characteristics of a patient having one disease condition which are distinguishable from those of another patient with a different manifestation of disease He is concerned not only with the fact that one patient has

peptic ulcer and another hypertension but with all the other factors which these two patients do not have in common

In the pursuit of this information he pays particular attention first to the heredity of the patient, which may be one factor predisposing him to particular illnesses He is interested next in the detailed personal history of the patient which will demonstrate the influences operating upon the patient from his environment and the modifications which the patient has himself been able to make in the pattern outlined for him by heredity and environment It is, however, in the examination of the patient that the constitutionally-minded physician may differ most from his colleagues In the physical examination he is concerned not so much with the manifestations of disease as with the physical individuality of the patient Detailed anthropometric studies have shown, for example, a tendency for persons of certain bodily builds to be more susceptible to particular diseases than other persons The scope of investigation has more recently been extended to include physiologic, biochemical, and even cellular studies with no less fruitful results [3 4] Patients with peptic ulcer, for example, tend to show physiologic deviations in the cardiovascular as well as the gastrointestinal system, for it has been found that they show a higher than average incidence of slow heart rates and prolonged P-R intervals in the electrocardiogram [5] In the psychologic panel the investigations are now frequently subsumed under the title of psychosomatic medicine, yet the psychiatrist, like the anthropologist, is simply trying to elucidate those characteristics of the patient which predispose him to a particular illness

A brief example of the manner in which some of these investigations may be linked can be given In any individual over a period of time there is a remarkable constancy of blood lipid values if nothing is done to alter this [6] The importance of this may be appreciated when it is remembered that there are significant correlations between high blood lipid values and coronary artery disease [7–9] Further, there seems to be a relationship between blood lipid values and body build [10] There is a possible relationship between body build and coronary artery disease and a definite one between cardiac disease and body build, although the latter observation is open to two interpretations of causality [11–13] Further, psychiatric studies have shown also the importance of personality factors in coronary thrombosis [14] As these relationships are further refined it will be possible to gain additional insight into the nature of coronary artery disease In the meantime, one can see, even if dimly, the importance of constitutional factors in this disease One can also discern the makings of a new preventive medicine no less significant than that concerned with epidemics of infectious diseases

The objectives of constitutional medicine may be illustrated further by a consideration of peptic ulcer That there is a definite correlation between the occurrence of gastric ulcers, bodily configuration, and personality is denied by none The long, lean face and large, narrow chest of these patients are familiar to every physician These impressions have been confirmed by actual measurements of height-weight ratio, gonial angle, subcostal angle, and other anthropometric indices The correlation between the measurements and the susceptibility to the disease is about 75 per cent [3] If the purpose of constitutional medicine were only to add another piece of diagnostic data to the large armamentarium of the physician, the contribution would not be very great, the radiologic diagnosis of the condition is perhaps 90 per cent accurate as far as the mere detection of an ulcer crater is concerned The problem, however, is more complicated than this Medicine seeks not only the discovery of disease but its explanation and prevention To this the radiologist can contribute little or nothing The student of constitutional medicine, on the other hand, interests himself in the predisposition to disease His objectives are the discovery of those persons who are vulnerable to certain conditions and the explanation for their vulnerability He seeks to know why these particular patients reacted in the particular way necessary for the production of peptic ulcer Other people are subject to the same stresses without acquiring peptic ulcers The investigator of the constitution is, therefore, concerned with discovering the particular psychologic and physiologic reactions which result in hypertension in one patient, bronchial asthma in another, and peptic ulcer in a third, when the environmental stimuli are the same

It is obviously incorrect to say that the bodily habitus or the personality of the patient produced the ulcer The bodily habitus and personality are two outward and obvious manifestations of the constitution of the patient A third manifestation of that constitution is the disordered reactivity which is responsible for peptic ulcer It is this functional deviation, rather than bodily habitus, for which patients with peptic ulcer will show a correlation of 100 per cent, and it is its discovery which is the ultimate objective of the investigations of constitutional medicine It is perhaps surprising, but nevertheless fortunate, that these patients show such an excellent correlation with regard to bodily habitus and personality pattern These correlations can be used in the

detection of the *locus minoris resistentiae* in susceptible persons before the actual disease develops. The study of these relationships, by illuminating deviations in the patient, aids also in the search for the immediate causal disorders of psychologic and physiologic function which have produced the ulcer. Thus the inductive analysis may greatly assist the more conclusive deductive process.

Constitutional medicine can also assist our understanding of the reactions of the patient to developed disease. When we speak of the severity of a disease we may mean one of two things. The term may be used to describe an extreme manifestation of the overt signs and symptoms of disease, such as the evidence of extensive consolidation of several lobes in pneumonia. It may also be used, however, to describe the effect which the local disease has on the organism as a whole. Clearly, the severity of this effect is all important in the outcome of the disease. Unilobar pneumonia from which a patient dies is obviously more severe than multilobar pneumonia from which he recovers. Yet we have so far no means of gauging this quality of severity, and the art of individual prognosis has made little progress in the era of scientific medicine. The means of developing this art lie in the careful study of individual psychologic and physiologic reactions to disease; from this study we may eventually be enabled to distinguish more accurately those manifestations of illness which are serious and harmful from those which are unimportant or favorable. The student of constitutional medicine advocates the abandonment of diagnostic labeling and syndrome medicine because "clinical entities," while commonly appearing in case reports, do not exist in patients. Such concepts may help us to classify our patients, but never to understand the subtle qualities which lead to recovery in one and to death in another patient apparently suffering from the same "entity." It would be preferable to substitute some scheme of biologic analysis which aims at the understanding of the whole person and the different components of his illness, for this illness must be seen as his life in a new form rather than as an object separate from him (Fig. 1).

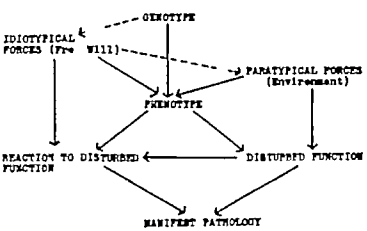

FIG. 1.—Scheme for the biologic analysis of constitution and disease.

The study of the individual patient as the principal agent of his disease is only just beginning to recover from its neglect during the ascendancy of bacteriology. We are slowly relearning that the assistance of natural recuperative powers is no less important than the development of specific treatments aimed at the "disease entity." No treatment can be more specific than the resistance of the individual to his disease and it is this resistance which is the study of constitutional medicine.

WANTS WIDE-OPEN FIELD FOR PSYCHIATRISTS

An all-out program of extracurricular activity for psychiatrists has been proposed by Dr. Carl A. Binger. He wants them to put in their oars at every level of public activity, from the local school board to the United Nations. Doctor Binger says psychiatrists should act as trouble-shooters when things go wrong at U. N. meetings, help diplomats understand each other even storm the fastnesses of the State Department. And he adds: Perhaps diplomats could get some training in psychiatry or psychiatrists some experience in diplomacy.—*Medical Economics, July 1948.*

peptic ulcer and another hypertension but with all the other factors which these two patients do not have in common

In the pursuit of this information he pays particular attention first to the heredity of the patient, which may be one factor predisposing him to particular illnesses He is interested next in the detailed personal history of the patient which will demonstrate the influences operating upon the patient from his environment and the modifications which the patient has himself been able to make in the pattern outlined for him by heredity and environment It is, however, in the examination of the patient that the constitutionally-minded physician may differ most from his colleagues In the physical examination he is concerned not so much with the manifestations of disease as with the physical individuality of the patient Detailed anthropometric studies have shown, for example, a tendency for persons of certain bodily builds to be more susceptible to particular diseases than other persons The scope of investigation has more recently been extended to include physiologic, biochemical, and even cellular studies with no less fruitful results [3 4] Patients with peptic ulcer, for example, tend to show physiologic deviations in the cardiovascular as well as the gastrointestinal system, for it has been found that they show a higher than average incidence of slow heart rates and prolonged P-R intervals in the electrocardiogram [5] In the psychologic panel the investigations are now frequently subsumed under the title of psychosomatic medicine, yet the psychiatrist, like the anthropologist, is simply trying to elucidate those characteristics of the patient which predispose him to a particular illness

A brief example of the manner in which some of these investigations may be linked can be given In any individual over a period of time there is a remarkable constancy of blood lipid values if nothing is done to alter this [6] The importance of this may be appreciated when it is remembered that there are significant correlations between high blood lipid values and coronary artery disease [7–9] Further, there seems to be a relationship between blood lipid values and body build [10] There is a possible relationship between body build and coronary artery disease and a definite one between cardiac disease and body build, although the latter observation is open to two interpretations of causality [11–13] Further, psychiatric studies have shown also the importance of personality factors in coronary thrombosis [14] As these relationships are further refined it will be possible to gain additional insight into the nature of coronary artery disease In the meantime, one can see, even if dimly, the importance of constitutional factors in this disease One can also discern the makings of a new preventive medicine no less significant than that concerned with epidemics of infectious diseases

The objectives of constitutional medicine may be illustrated further by a consideration of peptic ulcer That there is a definite correlation between the occurrence of gastric ulcers, bodily configuration, and personality is denied by none The long, lean face and large, narrow chest of these patients are familiar to every physician These impressions have been confirmed by actual measurements of height-weight ratio, gonial angle, subcostal angle, and other anthropometric indices The correlation between the measurements and the susceptibility to the disease is about 75 per cent [3] If the purpose of constitutional medicine were only to add another piece of diagnostic data to the large armamentarium of the physician, the contribution would not be very great, the radiologic diagnosis of the condition is perhaps 90 per cent accurate as far as the mere detection of an ulcer crater is concerned The problem, however, is more complicated than this Medicine seeks not only the discovery of disease but its explanation and prevention To this the radiologist can contribute little or nothing The student of constitutional medicine, on the other hand, interests himself in the predisposition to disease His objectives are the discovery of those persons who are vulnerable to certain conditions and the explanation for their vulnerability He seeks to know why these particular patients reacted in the particular way necessary for the production of peptic ulcer Other people are subject to the same stresses without acquiring peptic ulcers The investigator of the constitution is, therefore, concerned with discovering the particular psychologic and physiologic reactions which result in hypertension in one patient, bronchial asthma in another, and peptic ulcer in a third, when the environmental stimuli are the same

It is obviously incorrect to say that the bodily habitus or the personality of the patient produced the ulcer The bodily habitus and personality are two outward and obvious manifestations of the constitution of the patient A third manifestation of that constitution is the disordered reactivity which is responsible for peptic ulcer It is this functional deviation, rather than bodily habitus, for which patients with peptic ulcer will show a correlation of 100 per cent, and it is its discovery which is the ultimate objective of the investigations of constitutional medicine It is perhaps surprising, but nevertheless fortunate, that these patients show such an excellent correlation with regard to bodily habitus and personality pattern These correlations can be used in the

consideration the preconceived ideas of the patient and explain to him in simple terms the presence of any anatomic or functional abnormality which does not make any particularly desired change feasible There should also be a definite understanding of the definition of any technical terms used It is surprising how often a patient speaks of the length or shortness of the nose when referring to the degree of profile elevation.

Most intelligent patients can be made to understand that each case presents a particular problem and that the surgeon must be guided by his own judgment and by any limitations which may exist on account of anatomic abnormalities The patient who makes unreasonable demands, which, in the judgment of the operating surgeon cannot be met, is best left alone

Before and after photographs of comparable cases are of definite help in making the patient understand the possibilities and the limitations which exist in the individual case Freehand sketches of a proposed result usually exaggerate the actual operative possibilities and thus glamorize the anticipated result, furthermore, the exact replica of a model agreed upon may never be attained in vivo [4]

The patient should also be told about the type of anesthesia used, the slight discomfort to be endured and the length of time he or she will have to sacrifice from his or her normal activities The amount of postoperative swelling and ecchymosis is another individual factor which cannot be predetermined

When the doctor and patient cannot meet on common ground and the patient made to understand that there are possibilities for improvement but limitations to perfection, that patient should be tactfully refused

Type of Nasal Deformity

The ideal nose for correction from the point of view of the plastic surgeon is the "hump" nose (Fig. 1) this is usually accompanied by excessive length of the nose, excessive width of the nasal bridge, and frequently by some bulbousness of the nasal tip This general type, then providing the skin is thin and of good quality, lends itself most suitably to correction of all the defects enumerated. On the other hand, a similar nose with a pseudohypertrophy due to sebaceous thickening of the integument and subcutaneous tissues presents a less satisfactory prognosis. A fact frequently overlooked is that a major defect not only lends itself more freely to correction from a technical point of view, but that the more startling degree of change obtainable proves most gratifying to the patient. A more satisfactory and indeed startling transformation may at times be attained by a concomitant surgical procedure to correct a receding or prognathic chin (Fig. 2) Minor defects of the nose however which some patients want corrected present a more difficult problem Not only must each step of the operation be carried out with the most meticulous exactitude but the final result must pass more severe standards of esthetic perfection

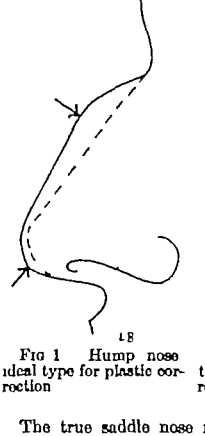

FIG 1 Hump nose ideal type for plastic correction

FIG 2 Chin corrections to further cosmetic results.

The true saddle nose needs the addition of tissue—the implantation of a graft—and it may be categorically stated that this type of operation is less satisfactory in the achievement of symmetry of line and smoothness of contour than are procedures involving reduction of profile (Fig 3)

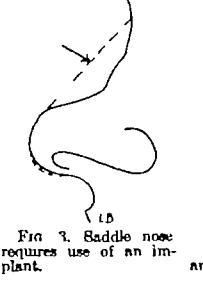

FIG 3. Saddle nose requires use of an implant.

POTENTIALITIES AND LIMITATIONS OF CORRECTIVE RHINOPLASTY

LEROY S SAFIAN, M D , New York

(*From the Hospital for Joint Diseases*)

THE purpose of this paper is to propose and discuss prognostic criteria governing successful end results in corrective rhinoplasty When the popularity of cosmetic procedures for the correction of nasal defects has increased to such an extent that they appear on many daily operating schedules, it is timely to discuss a few general indications and contraindications, as well as some of the anatomic limitations which cannot be circumvented by either impeccable surgical technic or unimpeachable artistic criteria This paper will restrict itself to corrective rhinoplasty which does not involve the replacement of skin lost through trauma or disease It is felt that by curbing the indiscriminate and injudicious selection of cases the number of operative disappointments can be kept to a minimum, at the same time avoiding the placing of a stigma upon an operation which proves of great benefit to so many patients

While the psychologic aspects of patients undergoing plastic surgery have been widely discussed, the prognosis from an anatomic and structural point of view has been neglected [1–3] In actual practice, it has been submerged because of a reluctance to discourage the prospective patient I cannot overemphasize the importance of discussing with patients the surgical limitations which are due to definite anatomic shortcomings More patients will be satisfied with their result if they have been apprised beforehand of the degree of improvement which they can expect The criteria which follow are, of course, merely prognostic, for distinct and marked improvement can be obtained even in cases without the ideal qualifications An attitude, feigned or naive, that promises perfection and does not recognize structural limitation is indefensible, particularly in the face of ever-present adventitious factors such as excessive cicatrization, adhesions, unresolved hematomata, periosteal proliferation, graft absorption, etc To these, even the time-tested Joseph technic or its modern modifications are not immune

Personality Evaluation

It is obviously impractical to make a detailed psychiatric study of the average patient who desires an esthetic improvement of a nasal deformity Virtually the same conclusions can be reached by a few well-chosen questions at the time of consultation The flagrant neurotic, groping for a panacea, who attributes his shortcomings to a misshapen nose rather than to uncompensated drives, will not be permanently helped, this type of patient will soon find fault with the operated organ or, likely as not, will blame some other facial feature for his or her inadequacies An individual who merely happens to be dissatisfied with or self-conscious about his or her nose, but in whom this feeling does not constitute part of a psychic symptom complex, is a much safer prospect The line of demarcation is frequently not readily discernible, especially when the surgeon is obliged to make a decision about whether an operation is advisable after only a single interview Furthermore, since it is a well-known fact in plastic surgery that the degree of satisfaction a patient has with his result is not in direct proportion to its excellence, a careful estimation of both the anticipated esthetic result and the type of individual involved is of paramount importance Men are by far more easily satisfied with their results than are women, a gratifying fact in view of the increased number of men patients This is partly traceable to the recent global conflict, where many men suffered ridicule because of their deformity or visualized keener competition for jobs in the postwar world

People in the theatrical world are, as a group, most appreciative and generally present few psychologic problems, for their prime purpose in having the operation is economic, they are seldom resentful, even if a secondary revision becomes necessary in order to attain the best possible result

An interesting insight into the patient's mental attitude may be gained by asking what prompted his determination for a rhinoplasty Experience has shown that patients who themselves express the desire for a nasal operation tend to adjust more satisfactorily than those who act as a result of repeated suggestion by others

Physician-Patient Relationship

After careful examination of the external deformity of the nose and a determination of the presence or absence of any complicating factors within the nose, the surgeon should be able to impart to the patient a fairly good conception of what changes he deems necessary to improve the appearance of that organ He should take into

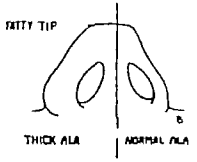

FIG 8. Technical obstacles fatty tip thick alae.

clay, can never be rendered delicate through surgery, although some thinning at the base of the nostril can be accomplished without visible scars (Fig 8) Wide nostrils, due to alae that are attached too far laterally onto the cheek giving the nose a broad base, can be corrected by narrowing the floor of the nostril, but mutilating external incisions in the nasolabial groove should be avoided. Nostrils deformed by a protruding subluxated lower end of the septal cartilage are amenable to correction by surgery, but the flattened nostrils and asymmetric alar attachment accompanying congenital cleft lip deformities cannot always be satisfactorily corrected.

Just as the graceful lines of the normal columella defy reproduction in reconstructive work, so are cosmetic procedures hampered by a retracted columella, or even by one that is on the same plane as the lateral nostril wall (Fig 6) The columella tends to become further retracted in these cases because of the pull exerted by the septocolumellar sutures employed in the shortening of the nose. On the other hand wide grooved, and drooping columellae can be corrected with gratifying results. Some minor postoperative asymmetries will be detected following a rhinoplasty, and patients are prone to point these out, unaware of the fact that differences (within normal limits) exist whenever one compares the two sides of the face

Condition of the Skin

After eliminating major dermatologic disease in general, and specifically those conditions with a predilection for the skin of the nose such as rhinophyma and its precursor acne rosacea lupus, etc , one is confronted with a goodly number of patients whose nasal skin presents large pores filled with sebaceous matter, a number of others have minor acneiform conditions and telangiectases Patients with large pores or those who previously have had excessive x ray treatment present definite limitations to surgical procedures Corrective rhinoplasty of the hypertrophied nose essentially involves a decrease in the size of the osteocartilaginous structures This permits the overlying skin, previously undermined to shrink down and to reattach itself to the smaller framework beneath. Large-pored skin is markedly deficient in this contractile power and, therefore does not adapt itself smoothly to the underlying framework. Further more, the dilated follicles impregnated with sebum and bacteria, penetrate to a sufficient depth so that they may be injured in the course of the undermining, notwithstanding meticulous dissection This may initiate a folliculitis with residual cicatrization, which may adversely affect the final result

Mobility of the Nose

The muscles of the nose are mostly rudimentary The principal ones are the compressors and dilators of the nostrils, involved in controlling the intake of air, and the elevators and depressors of the alae nasi In most people the shape of the nose is not altered appreciably by the muscles of expression In others, a pull exerted by the upper lip during speech is reflected in the frequently noted up and down bobbing of the nasal tip Surgical overcorrection—overshortening—will usually suffice to negate the muscle pull in this minor type of nasal mobility In pronounced cases, in which one notes, when the patient talks, smiles, or laughs, a definite drooping of the tip over the upper lip together with an elevation of the alar attachments and widening of the base of the nose, the strong muscular action persists postoperatively, tending to re-establish the previous appearance (Fig 9) Repeated corrective surgical shortening may become necessary at times in order to remedy this recalcitrant condition.

FIG 9 Effect of overactive muscles of expression.

Age of the Patient

The importance of resiliency of the skin in rhinoplasty has already been discussed Older individuals lose this contractile power and, therefore, present some surgical limitations, they may require additional undermining of the skin in order to secure the maximum amount of shrinkage The degree of relaxation of the skin, then has a definite influence in limiting the maximum age at which a rhinoplasty is advisable.

The minimum age for surgery also varies General developmental maturity rather than the actual age of the patient is a safe criterion Mental attributes auguring cooperation on the operating table should be discernible. Severe septal obstruction, congenital or traumatic, and frac-

Unpredictable factors transcending the question of a "take" come into play, e g , the degree of bone or cartilage absorption, the thickness of the fibrous encapsulation that forms about the graft (unavoidable even in nonbiologic implants), the firmness of the supporting structures, and the surgical limitations as to the size of the recipient pocket

Similarly, nasal defects where the nasolabial angle is acute, due to trauma to the anterior nasal spine or to the septum, or as part of "dish-face" deformity incident to underdevelopment of the superior maxillae, are among those exhibiting a deficiency of contour (Fig 4) It is necessary, in most cases, to provide a substitute for the septal spine or to advance the upper lip and the deeply attached alae by the use of cartilage implants or V-Y incisions in the oral sulcus [5]

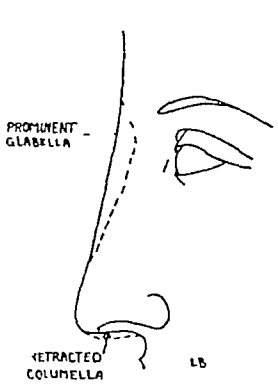

Fig 6 Deterring factors lack of glabellar indentation, retracted columella

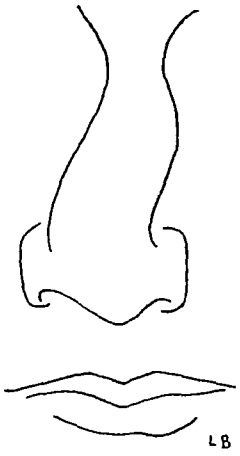

Fig 7 Twisted tip due to septal deviation

Structural Adaptability, The Septum

While actual operative experience with a multiplicity of nasal defects may be a prerequisite to a finer evaluation of anatomic shortcomings, even the inexpert eye can recognize many of the conditions briefly alluded to below

Osteocartilaginous Defects —A very wide nasal bridge accompanied by thick bony structures will look massive even after infracturing the lateral walls and reducing the size of the nose (Fig 5) Some men are under the impression that the thickness of the bony structures can be reduced by rasping Such a procedure will result in excessive callus formation and defeat its own purpose Similarly, gross asymmetry incident to nasal bone fractures or contributed by callus formation will often be reflected by some degree of inequality following a rhinoplasty

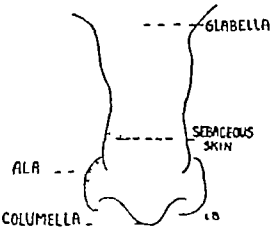

Fig 5 Deterring factors excessively wide nasal bridge, sebaceous skin

The straight frontonasal line present in cases with a prominent glabella can be only partly eliminated, for excessive undercutting and rasping in this area might incur trauma to the frontal sinuses above (Fig 6) A very long nose, due to excessive elongation of the nasal septum, will frequently require a secondary shortening following the original correction because of relaxation and stretching of tissues artificially placed under undue tension In fact, structures approximated under tension by adhesive tape or sutures will, in general, fail to maintain that position permanently

The deviated septum presents a problem in many rhinoplastic procedures A mildly deflected septum that causes no respiratory embarrassment before a rhinoplasty may cause symptoms following the narrowing of the bridge, done in virtually every case involving bony defects, and the patient should be warned of the possibility that a submucous resection might become necessary at a future date The occasional case where this occurs does not warrant the adoption, routinely, of a surgical procedure upon the septum However, any obviously obstructing septum should be corrected prior to the plastic as a separate procedure, or concomitantly by those who maintain that both procedures can be done at one sitting without incurring undue trauma Not only is the plastic operation impeded by a severe septal deflection, but a more severe respiratory impairment is likely to ensue unless the obstruction is eliminated A twist at the lower end of the septum, just posterior to the columella, can be eliminated by amputating the lower end of the septum in the course of shortening the nose However, when the deviation involves a great extent of the cartilaginous dorsum so that it produces a twisting deformity of the tip, a completely satisfactory correction is difficult to obtain (Fig 7) (Total removal of septal support and reimplantation of cartilage, as advocated by some for this type of case, permanently removes the structural solidity of the nose and jeopardizes most other procedures undertaken to obtain the desired outline for the new nose)

Soft Tissue Defects Around the Tip —It may be safely stated that a very large tip is less adaptable to correction than is a large hump, for in the latter case the undermined excess of skin can shrink and adjust itself over a wider area (Fig 8) A cleft tip cannot always be corrected without some residual evidence of that condition. Thick alar attachments, being made of tissue and not of

PHENYLETHYLHYDANTOIN IN THE TREATMENT OF SYDENHAM'S CHOREA

THOMAS ROGERS KIRK, M.D Rochester, New York

(From the Department of Pediatrics University of Rochester School of Medicine and Dentistry)

PHENYLETHYLHYDANTOIN ("nirvanol") has been used for twenty-six years in the treatment of Sydenham's chorea. It was introduced for such treatment in Germany by Roeder in 1919, in England by Poynton in 1929, and in this country by Ray and Cunningham in 1930 [1–3] Although most authors report favorably on its use, several have reported unfavorable reactions

Since chorea is a highly variable disease, no therapeutic study is convincing unless a fairly large number of cases is included, and unless comparison is made with cases in the same series in which patients were treated by other methods This report is based on a study of 243 cases from the Strong Memorial and Rochester Municipal hospitals over the period of fifteen years from 1930 to 1945 There are 107 of these cases in which the diagnosis is unquestioned, the records are complete, and but one form of treatment was used during one hospital admission

The attacks of chorea are classified according to the plan outlined by Barnacle.[4] Those listed as mild had intermittent limited choreiform movements, usually without grimaces or speech defects Those listed as moderate had more choreiform movements, some grimaces, and some speech defects. Those listed as severe had continuous widespread movements, grimaces, definite speech impediment, and some cases were violent.

Phenylethylhydantoin was administered by mouth in doses of 0.25 Gm per day for the younger children, and 0 9 Gm per day for the older ones. Dosage was continued daily until the onset of the eruption usually from seven to ten days If there was no reaction the drug was usually discontinued after fourteen days The patients were hospitalized during the entire course of treatment.

Results

In 'nirvanol sickness ' the sedative effects of phenylethylhydantoin usually appear on the second or third day of its administration Fever usually develops on the seventh day reaches a maximum on the ninth day, and subsides on the eleventh day The fever can be prolonged by the continued administration of the drug beyond its onset. On the ninth day a few reddish brown maculopapules appear on the thighs wrists, or abdomen the face often appears swollen and flushed, and a pale pink enanthem may appear on the soft palate or buccal mucosa. By the next day or so the exanthem has become general It is usually distinctly morbilliform but somewhat more urticarial than the rash of measles Itching may be intense Occasionally, the rash is punctate or resembles that of scarlet fever

Girls outnumbered boys in a ratio of 1 5 1, a rather unusual finding The average age was nine years The youngest was four years and the oldest was fifteen

Of those treated with phenylethylhydantoin, seven (12.5 per cent) failed to show an exanthem, six others who failed to show it had either previously or subsequently developed an eruption during administration of the drug Five of the seven without rash were afebrile, but only one of these failed to respond to treatment.

"Nirvanol sickness" does not always result as a response to administration of the drug nor do the fever and rash appear to be essential for successful treatment of chorea Six patients had scarlatiniform and seven had urticarial, instead of the usual morbilliform, eruptions. In each of eight cases, more than one type of rash appeared. Usually, these were of two types either a scarlatiniform rash on the fifth day followed in five days by a morbilliform eruption, or the typical morbilliform eruption on the sixth to ninth day followed in one or two weeks by an urticarial rash Three of the eight patients showed an exanthem after the first dose of a second course of the drug Eosinophilia, mild leukopenia, and relative lymphocytosis generally occurred in patients with the typical exanthem Figure 1 shows typical morbilliform eruption due to phenylethylhydantoin. Figure 2 shows an urticarial rash

In none of our cases did persistent harmful effects develop One girl developed a rash resembling exfoliative dermatitis. Reported harmful effects from phenylethylhydantoin are as follows agranulocytosis, hemorrhagic nephritis delirium dyspnea associated with swelling of the tracheobronchial nodes, subcutaneous hemorrhages edema of the bronchial mucosa with bronchial hypertonus stomatitis, edema of the lungs with cardiac embarrassment and the discomfort attending the usual reaction [6–12]

Influence on Chorea

The primary sedative action of phenylethyl

ture deformities can and should be corrected even if the ossification centers are still active, but manipulation should be kept to a minimum lest growth be interfered with [6] Cosmetic rhinoplasty in the very young should be limited to those individuals developing definite neurotic tendencies directly traceable to their nasal defect In these cases, the possible need for further surgery at maturity should be made clear to the parents

Previously Operated Cases

A certain proportion of patients will require small secondary corrections in order to satisfy their expectations completely This may consist of a slight increase in tilt or the correction of slight asymmetry which appears more obvious than that encountered in normal features The surgical correction can, for the most part, be accomplished satisfactorily and usually without a breakdown of the physician-patient relationship, emphasis on the minor character of the procedure is self-evident, and an attitude of "leave well enough alone" on the part of the surgeon is advisable, for the passing of time is in his favor Occasionally, a second surgeon is sought for this correction, again usually to the ultimate satisfaction of the patient

There is also the greatly increasing number of surgically mutilated patients, who almost invariably expect too spectacular an improvement to be wrought by the next surgeon they visit They fail to realize the greatly increased difficulties and hazards in such an undertaking and usually prove ungrateful, even following excellent reparative procedures

Finally, there is the patient with an apparently satisfactory surgical result, but the victim of an erroneous personality evaluation, who forsakes the original operator and fanatically seeks further plastic procedures Such operations are occasionally performed by some unwary surgeon without any fundamental benefit to the patient but with an ensuing vociferous rancor toward all surgeons involved These patients, unable to adjust themselves to their new appearance, have received a psychic trauma which only occasionally is mitigated by the passing of time and by repeated compliments concerning their appearance Sometimes they are in need of psychotherapeutic treatment

Summary

An effort has been made to give an insight into the problems involved in corrective rhinoplasty and to enable a physician either to advise or discourage prospective patients because of his familiarity with their psychic make-up The surgical potentialities in the various types of nasal defects have been enumerated, and a knowledge of these would also be of great benefit to his patient

REHABILITATION FOR THE TB PATIENT

Successful rehabilitation requires a comprehensive and effective sanatorium program and close cooperation between the sanatorium and the community All the community services must be integrated to serve the patient and family during all the phases of treatment, from the time of diagnosis until the individual is fully adjusted. Under these conditions patients will accept sanatorium care, remain till their tuberculosis is arrested, and follow through with necessary rehabilitation plans —*American Review Tuberculosis, January, 1947*

MATERNITY DEATH RATE DOWN

The risk of dying during childbirth decreased during 1946, according to figures of the National Office of Vital Statistics In that year, 5,153 women died in the United States from causes related to pregnancy and childbirth, representing a maternal mortality rate of 1 6 deaths per 1,000 live births, as compared with 5,668 deaths and a rate of 2 1 in 1945

The national maternal mortality rate has been declining steadily, beginning with 1930 The rate in that year was 6 7, or over 4 times as large as the rate in 1946 —*Ohio State Medical Journal, July, 1948*

PHENYLETHYLHYDANTOIN IN THE TREATMENT OF SYDENHAM'S CHOREA

THOMAS ROGERS KIRK, M.D Rochester, New York

(From the Department of Pediatrics University of Rochester School of Medicine and Dentistry)

Influence on Chorea

The primary sedative action of phenylethyl

Fig 1 Morbilliform rash due to phenylethylhydantoin

Fig 2 Urticarial eruption due to phenylethylhydantoin

hydantoin in chorea is slight When the characteristic "nirvanol sickness" appears, choreic manifestations become exaggerated When the rash and fever begin to disappear, choreic symptoms rapidly subside The subsequent course of the disease is definitely shortened Since all the records were reviewed by one individual, the observations recorded in the two larger series should be comparable

For the severe cases, the average duration of chorea from the beginning of treatment to recovery was twenty-six days when phenylethylhydantoin was used and seventy-seven days when other drugs were used The latter group includes two cases in which the duration was shortened by extraordinary means one by a concurrent acute sinusitis, the other by a rash and fever from phenylethylbarbituric acid

For the moderate cases, the average duration of chorea from the beginning of treatment to recovery was twenty-five days when phenylethylhydantoin was used and forty-three days when other drugs were used

There was one failure in the cases treated with phenylethylhydantoin and nine failures when other drugs were used Forty-two to seventy days is the reported duration for chorea [13] A duration of seventy or more days without recovery is considered a failure in this study The average duration of chorea from the beginning of treatment to recovery was sixteen and one-half days when hyperthermia was used There were no failures

In a group of 25 severe cases treated with phenylethylhydantoin, ten experienced recurrence of the disease, in a group of 33 moderate cases, seven recurred The total was 17 recurrences among 58 cases under continued observation There was a total of 15 recurrences in a group of 45 cases treated with other drugs There were no recurrences in the group treated with hyperthermia

The group treated with hyperthermia compares favorably with those reported in the literature [14–19] The group treated with phenylethylhydantoin compares favorably with the series reported in the literature [2 3,10–12 20–29] Weisman and Leslie tabulated the first six references listed and found the average duration was twenty-five days, with 29 failures in 178 cases [14–18] The last three references listed had approximately the same time period and 22 failures in 187 cases In one series of six cases, all were failures, and all but two of these later responded to typhoid vaccine therapy [29]

In our entire series, 51 children (47 per cent) eventually had some evidence of carditis, i e , an altered electrocardiogram, an enlarged heart, or a permanent murmur

Comment

The mechanism of "nirvanol sickness" is obscure Nothing similar has been observed in animals In rabbits, large doses (from 10 to 20 times that used in man) have led to exhaustion of the bone marrow and agranulocytosis [3] Schick has reported on the toxicity of the optical isomers of phenylethylhydantoin [5]

There is a similarity to serum sickness that has been noted by many authors the frequent eosinophilia, the exanthem, and the occasional desensitization. The sudden shift from alkalosis (during the early administration of the drug) to acidosis at the time of the febrile reaction has been thought to be a significant feature of its mode of action [21]

Undoubtedly phenylethylhydantoin is not specific in its action on chorea, since there are many other ways of producing a similar result

The ease of administration, the absence of untoward reactions in our series, the failure of the drug to have a deleterious effect on coexisting carditis in this and other series, and the greatly shortened course of the disease seem to warrant the use of phenylethylhydantoin in moderate and severe chorea

Phenylethylhydantoin does not produce results so rapidly as does hyperthermia, especially that produced by typhoid-paratyphoid vaccine, but the sedative effect, the requirement of less highly trained personnel, and the safety with which repeated courses may be given are advantages in the use of "nirvanol" not possessed by all types of hyperthermia.

Summary and Conclusions

1 Sixty-six cases of Sydenham's chorea treated with phenylethylhydantoin are compared with 51 cases treated with various other drugs

2 Phenylethylhydantoin proved to be more effective than other drugs in the treatment of chorea The duration of the disease was reduced approximately one half There were fewer failures, but recurrences were not significantly prevented

3 Although "nirvanol sickness" may cause temporary discomfort, no permanent harmful effects were noted in this series.

4. Because of the possible danger to bone marrow, frequent blood counts should be made in patients treated with phenylethylhydantoin

5 The administration of the drug should not be continued after the appearance of the eruption, nor for more than fourteen days.

6 There were no harmful effects on treated patients with active carditis

The phenylethylhydantoin used in this study was supplied by R. J Strasenburgh Company Rochester New York.

SALES TALK

Every now and then the physician has to sell an idea that he knows the patient won t relish but that is necessary for the patient s good—like submitting to a major operation or committing a loved one to a state hospital or moving to another part of the country

How to get compliance?

One colleague we know has given a lot of thought to his approach If an operation is his aim he may suggest it in this way

"I could promise you that the prescription I've just given you will work a miracle. I could then tell you to go home and stop worrying But you re too intelligent to believe it. I'll lay my cards on the table therefore and say frankly that while this prescription will help you temporarily, an operation is your only hope for permanent relief

This approach reflects two cardinal principles of successful selling It flatters the person s intelligence and it anticipates his objections Thus it lessens his resistance.

What sets it apart from ordinary selling is the fact that service to the patient, not profit to the entrepreneur, is the driving motive behind the approach. But human nature being what it is, the gambit is as handy in the consultation room as along a Fuller brush route.

—*Medical Economics August, 1948*

THE ACCIDENT-PRONE PATIENT

MARION NORRIS GLEASON, Rochester, New York

DURING the last twenty-five years a concept of accident causation and prevention has been developing that may have as great an influence on the public disability and death rates as the discovery of the sulfonamides and penicillin The concept is that repeated accidents are symptoms of physical and emotional disorders which, in many cases, can be diagnosed and treated clinically In other words, if a person has repeated falls, bumps, cuts, or similar injuries, he suffers from a predisposition to accidents and should seek medical help, just as he should if he suffers from joint pains, chronic indigestion, or a neurosis Otherwise, sooner or later, he will very likely suffer a major injury which may cripple or kill him.

Pasteur divorced the unhappy couple, accidents and disease, when he made the discovery that bacteria were the cause of certain infections This started the great public health drive toward universal freedom from epidemic disease and diverted medical research and practice from the wide areas of speculation and metaphysics into narrower paths through laboratories equipped with microscopes and test tubes But the accident problem still remained a matter of demoniac luck or divine correction

Then Robert Koch presented his theory of immunization, and epidemiologists like Charles Chapin established the practical application of this theory Soon the downward trend of the terrible death rate due to epidemic diseases was apparent on the public health charts, but, with the growing control of contagious diseases, statisticians watched the rising rates of disability and death due to accidents climb into the spaces left by smallpox and yellow fever There was a tremendous reduction in child mortality from diphtheria and dysentery, but shocked public health officials saw that accidents were rapidly becoming the number one killers of children and young people

The first successful attempt to make a scientific study of the accident-prone personality was undertaken in England in 1919 by Greenwood and Woods, investigators for the British Industrial Health Research Board [1] They established, on a statistical basis, the fact that about 20 per cent of the people have most of the accidents, while the remaining 80 per cent are comparatively accident-safe

Since then, many similar studies have been made, implemented largely by industrial and insurance groups, with traffic bureaus actively interested Despite many confusing variables which make a correlation of such work difficult, there has been a general agreement with the original findings of Greenwood and Woods, and the ratio of 20 to 80 between the accident-prone and the accident-safe remains

A wealth of material has been written on accident-proneness William Hollis, formerly research associate of the New York University Center for Safety Education, and now senior safety engineer of the Los Alamos Scientific Laboratory, Los Alamos, New Mexico, has over 1,000 titles in his bibliography of literature on accident-proneness and related subjects The following quotation is from Boyd Fisher's widely used book, *Mental Causes of Accidents,* published in 1921 "Accident hygiene is like prescribing for sick people individually, as their causes require Public health does everything possible to preserve the health of the whole community Private medicine, nevertheless, finds much illness to treat that cannot be prevented in a wholesale way And so, too, we find that after we do all of the accepted things in safety work, we still have accidents arising out of special circumstances affecting individuals, and we must supplement general safety devices by prescribing a special kind of safety medicine After we treat men for accidents growing out of traits in which they are alike, we must treat them for accidents growing out of traits in which they differ "[2]

To Dr Flanders Dunbar of the College of Physicans and Surgeons, Columbia University, can probably be credited the first statistical medical approach to the personal factors back of accidents In her pioneer studies of 1,600 fracture cases at Presbyterian Medical Center, she demonstrated that the prevention of accidents is the concern of the medical profession In her book, *Psychosomatic Diagnosis,* she says, "Accidents are an important factor in public health " Further, "Physicians have hesitated to study the problem of accident-proneness, perhaps because of the difficulties inherent in it—although it is no more baffling than the problem of cardiovascular disease—or perhaps because, like everyone else, they have assumed that accidents always happen by accident "[3]

Dr Dunbar's studies were confirmed by Drs Jurgen Ruesch and Karl Bowman at the University of California Medical School, where they used 256 cases of head injuries for their work. They report, "Analysis of the circumstances of the accidents as a whole reveals that only a minority of the injuries were caused by accidental, unfavor-

able circumstances. The majority were caused by factors which bear on the character of the injured subjects."[4]

At the other extreme of the psychosomatic field where we find physical factors are stressed, the following opinion has been expressed by Dr I Pearse, coauthor of *The Peckham Experiment*, in which are described studies made of 4,000 families at the Pioneer Health Center in London "In our opinion the primary cause of accident-proneness is physical disorder If you have studied the recently published *The Peckham Experiment* you will see that, taking our population to be a reasonable sample of the general population of this country, there were 90 per cent of the people with some disorder Only 20 per cent of the individuals studied by us were aware of their disorder, that is to say, suffering from disease or disability I cannot think that any action pattern to be observed in leisure time is not equally to be seen in working time, and if this were fully investigated it would not turn out to be closely related to accident-proneness."[5]

Many industries have been successful in using this concept to reduce accidents among employes. The result generally has been a gratifying drop in the on-the-job accident rate. However, reaching individuals in the homes and on the farms, where there is little supervision or mechanical protection, has been a problem presenting discouraging difficulties Furthermore there has seemed no way to attack the appalling accident death rate of preschool children except by educational drives for parental carefulness.

Last year a comparatively simple procedure with wide sociologic implications was outlined by Dr Richard Jaenike of the University of Rochester School of Medicine and Dentistry Dr Jaenike, a clinical psychiatrist, has been interested for some time in the study of slight petit mal and psychomotor attacks of epilepsy as a possible cause of many unexplained accidents This was his practical and humane suggestion "A complete medical, psychological and neurological examination given to accident repeaters, especially children, might reveal not only the disorders of which the accidents are symptoms, but other hidden disorders as well Such a thorough examination, followed by the proper therapy should enable the patient to leave an accident clinic better prepared in every way to lead a happier and healthier life An accident clinic also would have the practical advantage of attracting a public that still frequently rejects the idea of a psychiatric interview or a brain wave test for possible epilepsy"

As a result of this suggested solution to a baffling problem, considerable discussion has taken place among various specialists as to how such a medical accident clinic could be set up and it now seems a matter of a few months before one or more clinics for accident repeaters will be established.

In discussing the implementation of clinical procedures for the accident-prone, it has been necessary to accept the fact that such a patient presents a sociologic as well as a medical and psychiatric problem Fortunately, the wide acceptance of the theory of psychosomatic diagnosis and therapy by lay people as well as by the medical profession enables the study of the accident-prone personality to fit very well into the pattern of the concept that the emotional and environmental background of an ill person must be considered along with the study of the patient's actual disease To paraphrase Dr Fred Shattuck, "It is more important what kind of a fellah has an accident than what kind of an accident the fellah has"

Dr William L. Bradford, professor of pediatrics at the University of Rochester School of Medicine and Dentistry, was one of the first specialists to make clinical use of Dr Jaenike's theory The following example of one of Dr Bradford's cases provides an excellent illustration of the principles involved in the clinical detection and treatment of accident-proneness, especially in the preschool child

A three-year-old boy was brought to Dr Bradford's office with a cut in his forehead After the injury had been treated Dr Bradford questioned the mother and found that the child had an accident history of many tumbles, bumps, and bruises. The boy was given an orthopedic examination which revealed knock knees and weak ankles Simple exercises and lifts in his shoes were prescribed, and the boy was no longer afflicted with repeated falls.

Further discussion of the case brought out the fact that the weak ankles and knock knees were caused by malnutrition. This condition, in turn, was the result of the child's being so spoiled that his eating habits had suffered. The emotional factors back of this situation brought the case into the psychiatric field The question may well be raised here as to how a general practitioner, who might readily make the proper diagnosis of the causes back of his patient's repeated injuries due to accidents, could offer a therapy that requires psychiatric procedures. Dr Jaenike again gives an encouraging answer to this problem

With accidents a miss is frequently as good as a mile and there is often a hair-line difference in space or a split-second difference in time between a near accident and an injury Even a small amount of insight into the cause of a person's accident-proneness either physical or emotional, can often provide the slight amount of restraint

or care that might prevent an accident from taking place

In discussing the setup of a clinic for accident repeaters, besides routine pediatric and medical examination, the following factors have had special consideration.

Instruments (Ortho-Rater and Sight-Tester) have been perfected which can detect visual defects contributing to an individual's accident-proneness These instruments can be operated by trained laymen, and accidents in one industry have been reduced directly or indirectly about 20 per cent through the use of this device Hearing losses can also be detected by a similar instrument (Audiometer) which is designed for the use of trained laymen

It is possible that such instruments, operating in a mobile unit through rural farm areas, could do much to reduce the number of accidents caused by buzz saws, axes, and smaller tools Visual and auditory defects of farmers' wives and children could also be detected and a visit to an ophthalmologist or otologist be recommended

A study has been made of a number of elderly pedestrians who have been hit by autos, and they were found to have almost complete occlusion of hearing due to hardened wax in their ears This condition is often found where there is a tense and nervous personality, particularly in older people

From public health nurses have come reports of children and two cases of older people who suddenly commenced to stumble and fall with increased frequency One case was reported of a boy who not only started to fall down stairs frequently but up stairs as well His medical history revealed a recent slight infection which was given a postdiagnosis of poliomyelitis A muscle grading test was given, and the weakened muscle found and trained back to better control

The history of Dr Bradford's case described previously covers only one type of orthopedic accident-proneness Dr Bradford suggests that public school physical education teachers and nurse teachers could spend time profitably studying the correlation between postural defects in children and repeated accidents

Pharmacology and toxicology are two of the most needed fields for medical research and patient education in clinical safety work Here is a case reported by Dr J G Fred Hiss of Syracuse Dr Hiss is a cardiologist, and a patient was referred to him as needing a specialist's care When he first saw her, she was hospitalized and was in such a disorganized state she needed constant attention, as well as high boards at the sides of the bed to prevent accident After examination which revealed no organic heart trouble, Dr Hiss inquired about medications she was receiving He ordered all medication stopped The next day she was normal and ready for discharge

Between 1925 and 1935, at the Massachusetts General Hospital, one out of every four cases of poisoning was attributed to therapeutic drugs, and last year at the Strong Memorial Hospital of Rochester, New York, with a census of about six hundred patients, it was estimated that one admission a day was related to an overdosage of prescribed medications *

The number of admissions to hospitals of patients in a disorganized state suffering from bromide poisoning is high and is of special interest to safety workers, since bromide poisoning may keep the patient accident-prone for from three to four months

Traffic bureaus could well make a study of the effect of barbiturates on alcoholics It might be found that the sedative had as much to do with drunken-driving accidents as the alcohol, or that, in combination with the alcohol, it was at least a contributing factor

It may well be argued that the good medical practitioner has been treating accident-prone patients clinically for years, and that an accident clinic is only a new angle or a different focus on an old procedure But sometimes a new focus is necessary when a need is great

The motivating philosophy behind this approach is well expressed by Dr Lydia G Giberson, industrial psychiatrist of the Metropolitan Life Insurance Company "Safety, again, as I see it, is a sign of positive coordination, a sweetness of physical and mental health, the adaptation of a twentieth century adult to his industrial environment It is extremely important to remember that all of the environment must be considered, for man lives, breathes, and works as a unit Safety is a humane consideration and a grace accruing to a really decent civilization "[6]

Case Reports

DIPHTHERIA INFECTION OF THE SKIN OF THE FEET

WALTER C LEVY, M.D., Jamestown New York

ALTHOUGH a rather cursory review of the literature reveals a great many references to cutaneous diphtheria practically all these reports are found occurring among military personnel [1-3] Since diphtheria of the skin is apparently such a rarity in civilian practice it seems worthwhile to present a single case.

Case Report

A 12-year-old boy was admitted to the Brooks Memorial Hospital, Dunkirk, on the private service of Dr J R. LaPaglia, in the early morning of October 17 1947, with convulsive seizures and a slow pulse. He had had sore feet of about two weeks' duration preceding his admission. There was on the left foot a large ulcerative area elliptic in shape, measuring about 5 inches in length and about 3 inches at its widest point, extending along the medial aspect of the foot from the base of the hallux anteriorly almost to the heel with a circular black crusted area about 1½ inches in diameter opposite the metacarpophalangeal joint which looked like a gangrenous area of skin somewhat resembling a burn which had been coagulated with tannic acid This crust which was tightly adherent to the underlying tissue had a U-shaped defect near its periphery which was covered with yellowish-gray exudate. There was a smaller ulceration on the right foot, also elliptic in shape located on the medial aspect of the big toe, resembling that on the left foot but without the gangrenous appearing crusted area.

At the time of admission, the pulse was 30 blood pressure 80/40 and temperature 100 F The skin was cold and clammy He appeared to be in a state of shock. Tonsils and pharynx appeared normal with no injection or evidence of exudate. No cervical glands were palpable. Deep reflexes were exaggerated. Heart sounds were weak with the rate being 28 to 32 per minute. Convulsive seizures occurred at intervals, particularly upon stimulation produced by touching him.

The history as obtained indicated that the boy had been limping for about two weeks before his admission to the hospital because of painful feet. The lesions on the feet started as a slight scratch on each foot. From these scratches blisters had developed which spread on the left foot from the big toe over the dorsum and around the medial aspect to the plantar surface almost as far back as the heel, that on the right foot was confined to the medial aspect of the big toe. He was seen at the doctor's office on October 10 1947, six days before his admission at which time the blistered and raw areas with necrotic tissue were cleansed and treated with sulfathiazole powder Rest and hot packs were prescribed. He was not seen by the physician again until about 2 00 A.M., October 17 1947 at which time the child was having convulsions and the slow pulse was noted Immediate hospitalization was ordered.

The tentative diagnosis before and on admission to the hospital was toxemia due to tetanus bacillus infection with complete heart block. After testing for sensitivity with tetanus antitoxin treatment was started with small doses reaching a total of 100 000 units by 4 00 P.M October 17, 1947 Also beginning shortly after his admission penicillin was started with a dosage of 30 000 units every three hours. This dosage was continued through October 20, 1947, to a total amount of 930 000 units of penicillin.

Also shortly after admission a culture was taken from the base of the U-shaped defect in the gangrenous area, inoculated on a Loeffler s slant and taken to the Chautauqua County Laboratory A spread made from the swab was examined and the opinion given that the organisms were very suspicious for Corynebacterium diphtheria in morphology This was confirmed by the examination of the growth on the Loeffler slant. On the basis of this information treatment with diphtheria antitoxin was begun about 5 00 P.M , October 17, 1947, with intramuscular administration in dosage of 10 000 units every three hours until 50,000 units had been given by 6 00 A.M October 18 1947 with an additional 10 000 units at 6 00 A.M October 19 1947 making a total dosage of 60 000 units of diphtheria antitoxin. Also on October 17 1947 5 000 units of diphtheria antitoxin were used locally on the wounds and another 5 000 units were also applied to the feet on October 20 1947

On the morning of October 18 1947 the patient's general condition was very poor, temperature was 101 F pulse ranging from 32 to 38 and respirations 40 to 48. However in the afternoon of that day the pulse began to increase in rate and improve in quality respirations became slower temperature declined, and his general condition improved. From that time his general condition remained good. His pulse rate increased to 72 to 80 and the lesions on the feet healed rapidly under local medication with sulfathiazole ointment and later cod liver oil ointment.

Laboratory Data.—Examination of the blood on admission showed a red blood cell count of 4,650 000 hemoglobin 94 per cent color index of 1 01 white blood cell count 15 100 80 per cent polymorphonuclear cells and 20 per cent small lymphocytes. On October 23 1947 the white cell count was 11 800

Urinalysis on admission showed a specific gravity of 1 027 acid, albumin 1 plus sugar 1 plus, and a few squamous cells white blood cells and bacteria on microscopic examination. Another urine specimen on October 23 1947 showed specific gravity of 1 010 alkaline, albumin 1 plus, no sugar and a moderate number of white blood cells on microscopic examination. The swab smear from the lesions on the feet was highly suspicious for diph-

theria. The culture from this same source, taken October 17, 1947, was positive for diphtheria bacilli Repeated nose and throat cultures were negative, as were subsequent cultures from the skin lesions

Progress.—When first seen, the lesions on the feet appeared as described above and apparently were very painful and tender When seen again on October 30, 1947, the patient's improvement in general condition had continued The feet were no longer painful, and there was considerable evidence of healing On the left foot the crust had apparently dropped off, and the only area covered by granulations was that which had previously been gangrenous in appearance The rest of the foot was covered with newly formed skin. On the right foot epithelization had proceeded from the edges, and a much smaller area than that previously described remained opened, raw, and covered with granulations

The patient's condition continued to improve, and he was discharged from the hospital on November 16, 1947, as recovered

Epidemiologic.—There was no history of his ever having received diphtheria immunization There was no history or evidence of sore throat or nasal discharge in the patient or in any other member of his household. This boy was accustomed to take walks through the fields and woods near his home which was located near the outskirts of the city About a week preceding the onset of painful feet he had been in a swampy area and had soaked through his shoes to his feet, following which a slight scratch or break in the skin occurred on each foot, on the left opposite the metacarpophalangeal joint and on the right along the medial aspect of the hallux.

Nose and throat cultures were taken on the other members of his household, other contacts being denied These comprised his father, mother, and five brothers These cultures were negative for diphtheria bacilli with two exceptions The culture from throat of a brother, A. W, aged fifteen, was positive for diphtheria bacilli, and a culture from the nose of another brother, N W, aged ten, was positive There was no clinical evidence of diphtheria in either of these brothers, therefore, it appears that they were carriers, although it could not be determined whether they or one of them was responsible for the infection of the feet or whether they became infected from the skin infection

Comment

Cutaneous diphtheria is apparently an unusual condition in civilian life, although it is not uncommon in military practice, especially in the Mediterranean area and in the Near East References to myocardial complication such as was seen in this case are found in the literature Neuritic complications which apparently are more likely to occur were not observed in this case

The rarity of cutaneous diphtheria in civilian practice may well be more apparent than real It is quite possible that the routine culture of many skin lesions might reveal that infection with Corynebacterium diphtheriae is more common than is generally realized

To illustrate this, reference can be made to a familial outbreak of diphtheria in August and September, 1945, in Hornell The mother, the first case recognized and diagnosed, had pharyngeal diphtheria A newborn infant in the family was found to have a diphtheritic membranous infection of a circumcision wound which preceded in onset that of the mother's pharyngeal infection A third case occurred in the family in a seven-year-old boy, this being pharyngeal diphtheria Subsequently, the father, who was a captain in the military service, was found to have a deep, infected, unhealed wound of the back of the left hand and left arm, which was called "jungle rot," but which, when cultured, was found to be positive for Corynebacterium diphtheriae Virulent diphtheria bacilli were isolated on culture from each of these cases, including the infected circumcision wound in the newborn infant

The indicated treatment is the use of diphtheria antitoxin intramuscularly and, if necessary, intravenously Use of penicillin as local application has been recommended but was not used in this case Diphtheria antitoxin as a local application was used more or less empirically in the treatment of the case, but, subsequently, reference to its use was noted in the literature [4]

The convulsive seizures which were thought to be due to tetanus infection were probably due to cerebral anoxia resulting from the bradycardia

DIME-SIZED AREA IN BRAIN IS CONSCIOUSNESS CENTER

A dime-sized area in the very middle of the brain is the brain center for consciousness Location of this area was announced by Drs George N Thompson and J M Nielsen of the University of Southern California, at the meeting of the American Medical Association in Chicago

If this dime-sized piece of brain is destroyed, as by a blood clot, hemorrhage or tumor, the patient loses consciousness He goes into a deep coma and while he may live on for several days or even three weeks, he does not recover

Patients who sleep for prolonged periods, as in so-called sleeping sickness, or encephalitis, probably suffer damage to this seat of consciousness but not destruction of it, Dr Thompson said.—*Science News Letter, July 3, 1948*

GANGRENE OF THE HAND FOLLOWING TRAUMATIC OCCLUSION OF THE RADIAL AND ULNAR ARTERIES

ROBERT L. NACH, M.D. and HERMAN LOHMAN, M.D., New York City

(From the Surgical Service of Harlem Hospital)

ACUTE arterial thrombosis may result from varied forms of trauma, chief of which are penetrating and puncture wounds, fractures, contusions, crushing injuries and prolonged or repeated pressure. Lowenberg reported a case of thrombosis of the radial, ulnar and brachial arteries following a crushing injury of the thumb in a machinist who had been accustomed to using a "vibratory chipping hammer."[1] There were subjective and objective signs of arterial insufficiency but without resultant tissue devitalization. Perry and Allen described two cases of acute arterial thrombosis of the lower extremity with gangrene each following a single blunt injury in a patient with normal arteries.[2] Anderson reports occurrences of arterial thrombosis with intact adventitia following injury to the artery by bullet or shell fragment.[3] Evidently, in such instances, the penetrating missile transmitted sufficient force to disrupt the intima and not the adventitia with resultant thrombosis. Instances of axillary artery thrombosis due to repeated pressure by a crutch have been described by Platt and by Leriche and Stricher.[4,5] LeFevre reported the case of a sixteen year-old boy who after having been struck in the calf by a golf ball developed chronic arterial insufficiency of the leg.[6] Schör and Neff described two cases of segmental thrombosis of arteries at the wrist complicating trauma.[7] The exact pathology in both instances was discovered when they were mistakenly operated upon for stenosing tenosynovitis.

Case Report

F. L., an adult white man, aged 38, was admitted to the hospital on November 11, 1945. The patient gave a history of having been addicted to the use of codeine for the preceding five years. He had been accustomed to the self-administration of two grains of codeine four times a day intravenously. One week prior to admission he made such an injection on the anterolateral aspect of the left wrist. The following morning he felt tingling, burning, and coldness in the left hand. Two days later a bluish purple discoloration appeared on the tips of the fingers which subsequently extended up the fingers on to the hand. The patient admitted to having smoked two packs of cigarettes a day for ten years.

Physical Findings.—Blood pressure was 140/98, pulse 88, respirations 24, temperature 98.6° F. The patient appeared poorly nourished but in no acute distress. The pupils were equal and reacted strongly to light and accommodation. The skin over the shoulders, chest, and arms presented light brownish patches characteristic of tinea versicolor. Both lower extremities exhibited many small scars, the results of repeated skin punctures and cutaneous abscesses.

The skin over the terminal phalanges of the second, third and fourth fingers of the left hand was black, shrunken, and cold. There was a bluish discoloration of the proximal portions of these three fingers, the entire first and fifth fingers, and the palm of the hand including the thenar and hypothenar eminences. These areas of discoloration were hypesthetic to light touch and pinprick. The dorsum of the hand was slightly discolored. Motion in the wrist and fingers was painful and partially restricted, the fingers having been held in moderate flexion. The left forearm appeared normal in color but was decidedly cooler to touch as compared to the right side. Neither a radial nor an ulnar artery pulsation was felt. A normally pulsating brachial artery could be palpated down to its bifurcation in the antecubital fossa. Over the middle of the dorsum of the wrist a small pulsating artery was palpable presumably a branch of the posterior interosseous artery. The surface temperature and arterial pulses were normal in the right upper and both lower extremities.

Laboratory studies which included a complete blood count, urinalysis, blood Wassermann test, and blood sugar were all within normal limits.

Oscillometric Readings.—Left arm above elbow registered 3; right arm above elbow 6; left forearm above wrist 1; and right forearm above wrist 3.

Clinical Course.—On November 17, 1945, a left stellate ganglion block was performed with no subjective or objective improvement. The line of gangrene had become more clearly demarcated. On November 21 the left stellate ganglion block was repeated. Shortly after this procedure the patient became moderately dyspneic and complained of pain in the left chest. A chest roentgenogram taken on the same day disclosed a left pneumothorax with partial collapse of the lung. This pneumothorax disappeared spontaneously within ten days. This second stellate ganglion block also failed to afford relief.

On November 23 an arteriogram was made: 18 cc. of 35 per cent diodrast being injected into the distal third of the brachial artery. This showed a complete absence of the radial and ulnar arteries distal to the bifurcation of the brachial artery (Fig. 1). A small interosseous artery extending from the elbow to the wrist could be visualized. X-ray of the wrist revealed an abnormal irregularity and denseness of the scaphoid bone, the cause of which was not clear.

On November 25 it was noted that the fifth finger had also become gangrenous. Gangrene was complete from the tips to the middle of the second, third, fourth, and fifth digits. The proximal halves of these digits and the thumb were reddish-blue with bleb formation. The palm appeared blotchy with patches of skin gangrene except over the thenar eminence. The dorsum of the hand was warm and possessed good color. By January 30, 1946, clear lines of demarcating gangrene had formed at the interphalangeal joint of the thumb and the proximal interphalangeal joints of the other four fingers. Amputation of the gangrenous digits at these levels was performed. The patient was discharged from the hospital on May 20 with the amputation stumps partially healed but clean and granulating. There was ankylosis of all the metacarpophalangeal artic-

FIG 1 Arteriogram taken nineteen days after the trauma Diodrast, 25 cc, injected into the distal third of the brachial artery visualized only the posterior interosseous artery

ulations The palm had undergone considerable atrophy and replacement fibrosis A roentgenogram revealed marked generalized atrophy of the bones of the hand and wrist Although the hand exhibited such degenerative changes, it was considered cosmetically and functionally preferable to an amputation at the wrist

Comment

Several unusual facts present themselves in this case. Foremost is the occurrence of an acute arterial occlusion in the forearm following a supposed intravenous injection of codeine The patient had been a narcotic addict for many years, having changed from morphine to codeine because of the difficulty in obtaining the former The exact nature of the material last injected was unknown The patient stated that he received the same satisfactory response as on previous administrations An additional fact is the inclusion of arterial thrombosis as a complication occurring in "main-line shooters" Local abscesses, erysipelas, cellulitis, phlegmon, tetanus, malaria, and syphilis have all been known to occur There is no other reported mention of arterial thrombosis or embolism complicating such inoculation Codeine per se is not known to have any local irritating effect upon the vascular walls sufficient to cause local thrombosis, nor does it possess a vasospastic action that might initiate arterial occlusion We may be correct in postulating that the trauma of the needle puncture initiated the thrombosis

The history and clinical findings together with the arteriogram presupposes that a retrograde thrombosis of the radial artery and an orthograde thrombosis of the ulnar artery had occurred It is known that thrombosis of an artery ordinarily extends up to the next proximal bifurcation Thrombosis of the bifurcating branch is unusual. Whether the involvement of the ulnar artery was an extension of the thrombosis from the radial artery or secondary to an embolus from the site of the bifurcation is conjectural From the behavior of this case it would appear that the radial and ulnar arteries combined behaved as terminal arteries The collateral circulation afforded by the interosseous artery and other superficial arteries was not sufficient to maintain viability of the part However, in the case reported by Lowenberg, where the radial, ulnar, and brachial arteries were occluded, no gangrene ensued [1] The thrombosis involving the ulnar artery was sufficient to prevent the blood flow into the anterior interosseous artery, since the latter arises from the proximal fourth of the ulnar artery The posterior interosseous artery was visualized and palpable at the wrist This vessel receives the major portion of its blood supply from the radial recurrent artery which in turn is derived from the superior profunda and anastomotica magna arteries

Conclusion

This case is one of acute arterial insufficiency of the hand resulting from thrombosis of the radial and ulnar arteries following a self-administered injection of codeine This is a hitherto unreported type of complication occurring in narcotic addicts Gangrene of the digits occurred, thereby suggesting that the radial and ulnar arteries combined may act as terminal vessels

CONTACT THERAPY FOR CANCER OF LARYNX

Total laryngectomy may not be necessary when intrinsic laryngeal carcinoma is treated by contact x-rays through a laryngeal fissure Of nine patients with large cancers, Drs Bruce Proctor, James E Lofstrom, and Carl E Nurnberger of Wayne University, Detroit, report that eight are still without visible evidence of recurrence for periods up to twenty-one months after contact therapy Following exposure of the neoplasm, as much tumor tissue is removed as possible without mutilating the entire larynx When hemostasis is satisfactory, the tube is placed directly into the larynx and a single caustic dose of 5,000 to 12,000 r is applied to the bed of the tumor Postirradiation edema is never severe Hoarseness persists but not to a serious degree — *Modern Medicine, July 1, 1948*

NECROLOGY

Alice Ross Bennett, M.D , eighty-one died at her home in Buffalo on August 9 Dr Bennett was one of the first women graduates of the University of Buffalo School of Medicine and received her medical degree in 1890 She interned a year at Women s Hospital in Detroit and then spent three years at the Michigan Women s Hospital in Swatow China. On her return to the United States she was for a time a physician in Warsaw New York. Dr Bennett had also served on the staff of Children s Hospital Buffalo *A specialist in ophthalmology* prior to her retirement in 1929, Dr Bennett was a member of the Woman s Medical Society of the State of New York, the Women s Physicians' League, and the Board of Directors of Deaconess Hospital, Buffalo

William Frederick Bender M.D., of New York City, died on August 29 at the age of seventy two He was graduated from the College of Physicians and Surgeons, Columbia University in 1913 Since 1930 Dr Bender had been a physician on the gymnasium staff of Columbia University For several years he was physician to the New York Giants and also had been physical director at the West Side Y M.C.A and the 155th Street Y M C A At one time he was on the staff of the urology clinic of St. Luke s Hospital. Dr Bender was a member of the American Medical Association and the New York State and County Medical Societies.

Bert J Bixby, M.D., of Buffalo died on September 7 at the age of seventy two after having been ill since his retirement in 1945 Dr Bixby was a graduate of the University of Buffalo School of Medicine in the class of 1903 He was consulting surgeon to Millard Fillmore Hospital Buffalo A member of the National Gastroenterological Society Dr Bender was also a member of the New York State and Erie County Medical Societies and the American Medical Association

Maurice Caspe M.D died on August 30 at his home in New York City He was ninety years of age Before his retirement ten years ago Dr Caspe practiced medicine in New York City for more than fifty years. He was graduated from Bellevue Medical School New York University in 1886 and after graduation studied bacteriology in Germany under Robert Koch and Paul Ehrlich. He was a member of the New York Academy of Medicine and the New York County Medical Society

Charles De Klyn, M.D , of New Rochelle died on September 8 at the age of sixty-six A practicing physician in New Rochelle for forty years Dr De Klyn was graduated from Columbia University College of Physicians and Surgeons in 1905 He served as a major in the Army Medical Corps during World War I and had been on the staff of the New Rochelle Hospital. He was a member of the Westchester County and New Rochelle Medical Societies

H. Leland Fifield, M.D., died on August 10 at his home in Syracuse. He was sixty-seven years of age He was graduated from New York Homeopathic School in 1906 After graduate study in Europe Dr Fifield practiced medicine in Southington Connecticut, until 1912 when he moved to Syracuse. He was superintendent of Onondaga General Hospital from 1933 to 1938. Dr Fifield for a time was on the eye ear, nose, and throat staff of Onondaga General Hospital He was a member of the Medical Society of the State of New York, the American Medical Association and the Onondaga County Medical Society

Albert A. Gartner, M.D , sixty-one died on September 9 at his home in Buffalo Nationally known as an orthopedic surgeon, Dr Gartner had practiced in Buffalo for thirty four years He was graduated from the University of Buffalo Medical School in 1914 During World War I he served in Europe with Base Hospital 23 Dr Gartner during World II *was chairman of Erie County Medical Society's* preparedness committee which passed upon the status of physicians in relation to military service.

He was assistant professor of orthopedic surgery at the University of Buffalo Medical School, chief orthopedic surgeon at the Meyer Memorial Hospital, attending orthopedist on the Millard Fillmore and Sisters Hospitals' staffs, consulting orthopedist at our Lady of Victory Hospital Lackawanna, Jones Memorial Hospital, Wellsville DeGraff Memorial Hospital, North Tonawanda, and J N Adam Memorial Hospital, Perrysburg

Dr Gartner was a former president of the board of trustees of the State Medical Society and had represented it many times as a delegate to the American Medical Association He was also a member of the American Academy of Orthopedics and a diplomate of the American Board of Orthopedics.

Henry Steers Holland, M.D , of New York City died on August 28 at the age of sixty-seven. He was graduated from the College of Physicians and Surgeons in 1905 After serving his internship at St Luke s Hospital, New York City he joined the staff of the Sloane Hospital for Women for which he was attending anesthetist for thirty years. He was a fellow of the American College of Anesthesiology and a member of the New York State and County Medical Societies.

Edwin Welles Kellogg, M.D., New York City, died on September 11 He was sixty-nine years of age. Dr Kellogg was graduated from New York Homoopathic Medical College in 1903 He was on the staff of Flower and Fifth Avenue Hospitals. A fellow of the American College of Surgeons Dr Kellogg was a member of the American Medical Association and the New York State and County Medical Societies.

Walter D Spoor, M.D , of Schenectady died on August 11 at the age of seventy-three. He was graduated from the New York Homeopathic Medical College, Denver Colorado in 1890. Dr Spoor practiced medicine in Schenectady from 1897 until his recent illness. He was a member of the American Congress of Physical Therapy the Schenectady County Medical Society the American Medical Association and the New York State Medical Society

Lon E. Stage, M.D of Bliss died on August 21 at the age of eighty two He was graduated from the University of Buffalo School of Medicine in 1893 For more than fifty five years Dr Stage had been the only practicing physician in Bliss. He was a veteran of World War I Dr Stage was on the medical staff of the Wyoming County Community Hospital He was a member of the Wyoming County Medical Society the New York State Medical Society and the American Medical Association

MEDICAL NEWS

Presbyterian Church Seeks Medical Missionaries

THE Board of National Missions of the Presbyterian Church in the United States has several positions open for doctors in hospitals and health centers The positions, which should be filled immediately, include

1 Embudo Presbyterian Hospital, Embudo, New Mexico (A 25-bed hospital for Spanish-Americans, staffed entirely by women)—an associate woman physician

2 Presbyterian Hospital, San Juan, Puerto Rico (A grade A, 135-bed hospital with accredited School of Nursing)—a resident doctor in obstetrics and gynecology

3 For the same hospital as 2—a resident doctor in internal medicine

4 For the same hospital as 2—a resident doctor in surgery

5 The Guacio Rural Social Service Center, San Sebastian, Puerto Rico (The medical dispensary is designed to serve the health needs of the entire area Hookworm, roundworm, malnutrition and tuberculosis are major problems)—a physician (volunteer service for a two year appointment—transportation, room and board provided)

Information about these vacancies may be obtained from the Board of National Missions, Presbyterian Church in the U S A, Unit of Personnel Service, 156 Fifth Avenue, New York 10, New York.

City Department of Health Announces New Position

THE New York City Department of Health announces a new type of position in the field of public health—the Public Health Assistant Provision has been made in the current budget for 22 such positions at a salary of $2,100 per annum, and an additional 50 are anticipated in the near future

Duties of Public Health Assistants will be both in the clinic and in the field They will act as receptionists, register and admit patients, make and follow up patients' appointments, transfer records from one clinic to another, pull and file records, address and send letters to patients, physicians and agencies, record laboratory and other data, keep clinic rooms in order, prepare clinic supplies and stationery, assist in preparation for and during examination of patients, perform special messenger services and other related duties

Qualifications as set up are United States citizenship, three years of residence in New York City, and high school graduation or equivalent training Applicants must be physically agile and have the following personal attributes neatness, good speech and manners, tactfulness, and willingness to accept assigned tasks For the present the positions are limited to women.

Letters of applications from those who meet the qualifications listed will be welcomed during the month of October, 1948, and should be addressed to the Bureau of Personnel, Department of Health, 125 Worth Street, New York 13, New York

To Mark Nursing's Diamond Jubilee

THE seventy-fifth anniversary of professional nursing in the United States will be celebrated nationally as Nursing Progress Week from November 12 to 20, the American Nurses Association, New York City, has announced

A diamond jubilee celebration in New York City, including a dinner on November 16, will be sponsored by President Truman, former President Herbert Hoover, Senator Arthur H Vandenberg, and a committee of public leaders The dinner will commemorate the seventy-fifth anniversary of the graduation from nursing school of the late Linda Richards, American's first professionally-trained nurse Speakers at the dinner will include Dr Arthur W Allen, who is president of the American College of Surgeons

Illinois State Medical Society Demands Young Doctors Enter Service

THE Council of the Illinois State Medical Society recently made public a resolution adopted urging all young physicians to volunteer immediately for military service The resolution, introduced by Dr Edwin S Hamilton of Kankakee, who is also a trustee of the American Medical Association, was passed unanimously by the Council, which represents practically all the 13,000 physicians of the state

The resolution is directed especially at those young doctors who received all or part of their medical education at the expense of the government, under the wartime A S T P and V-12 programs, but who did not see service in the armed forces because the war ended before they had completed their courses The resolution states that these men are still under a moral obligation to repay the nation for their expensive education, aside from their duty as citizens

American Association of Blood Banks Holds First Annual Meeting

THE first annual meeting of the American Association of Blood Banks was held in Buffalo from August 26 through August 28, with approximately 200 present representing 28 states and six foreign countries. In addition to a business session, programs of scientific and administrative papers were presented.

Officers elected for the coming year include Dr Ralph G Stillman, New York Hospital Blood Bank New York City president, Dr Thomas H Seldon, Mayo Clinic Blood Bank, Rochester, Minnesota, president-elect Dr Ernest Witebsky, Buffalo General Hospital Blood Bank, Buffalo, vice-president Miss Marjorie Saunders, Baylor University Hospital Dallas, Texas, secretary and Mr W Quinn Jordan, Phoenix, Arizona, treasurer

MEETINGS

FUTURE

New York Academy of Medicine

The twenty first Graduate Fortnight of the New York Academy of Medicine on Advances in Therapy" will be held from October 4 to 15 at the Academy, with morning panel discussions, afternoon hospital clinics, evening addresses, and scientific exhibits and demonstrations to be included in the program.

Dr Ross Golden is chairman of the Graduate Fortnight Committee, which includes Dr Mahlon Ashford, secretary, and Drs. Alfred Angrist, Lloyd F Craver, Edward H Dennen Adolph G DeSanctis, Cary Eggleston, Franklin M Hanger, Lawrence S Kubie, Madge C L. McGuinness, John H. Mulholland and Louis J Soffer

American Cancer Society

A medical symposium on the cancer problem will be held in conjunction with the annual meeting of the American Cancer Society at the Hotel Commodore New York City, November 6 and 7

The four sessions will be devoted to the cancer problem, the problem of treatment—recent advances the lung cancer problem, and the family doctor medical education and research.

PERSONALITIES

Appointed

Dr Delma Wells Caldwell, formerly of the Medical Department of the International Harvester Company and a faculty member of Northwestern University, as medical director of Standard Oil Development Company, New York City Dr Henry A. Holle, assistant chief of the division of commissioned officers of the Federal Security Agency as New York district director of the public health service. .Dr Edwin J Nugent, medical director of Rochester Products Division General Motors, as medical director of Allison Division of General Motors, Indianapolis, Indiana Dr Irwin Paul Train as assistant professor of surgery, New York Medical College and assistant attending surgeon Flower and Fifth Avenue Hospital.

Awarded

Dr William F Martin Kings County Hospital Brooklyn a scholarship to the Trudeau School for Tuberculosis at Saranac Lake, by the Brooklyn Tuberculosis and Health Association

Speakers

Dr Leo F Simpson, Rochester president of the Medical Society of the State of New York, on "The Doctor and Public Health at the Conference of Health Officers and Nurses, Saratoga Springs, July 21 The speech was printed in the August 15, 1948, issue of *Vital Speeches*

New Offices

Dr Kenneth H. Burdick, general practice in Alfred Dr Robert L. Nelson New Berlin, Navy veteran general practice in Owego Dr Robert H Wiese general practice in Delanson.

COUNTY NEWS

Dutchess County

A question-and answer program on United Medical Service was the feature of the meeting of the Dutchess County Medical Society September 8 at St. Francis Hospital, Poughkeepsie. Participating were Dr Frederick E Elliott, U.M.S director of medical service Mr John McCormack U.M.S. executive vice-president, and Mr Frank Van Dyke, A.H.S. vice-president.

Erie County

The first meeting of the Erie County Medical Society for the 1948-1949 season will be held on Tues-

day, October 26, with a clinical afternoon and evening program at the Hotel Statler, Buffalo, under the chairmanship of Dr A. H. Aaron, chairman of the program committee

Speakers will include Dr George E Slotkin, assistant professor of urology, University of Buffalo, School of Medicine, "The Results of the Treatment of Urinary Tract Tuberculosis with Streptomycin Chaulmoogra Oil," Dr Gesa de Takats, associate professor of surgery, University of Illinois, College of Medicine, "The Treatment of Cerebral Apoplexy," Dr Charles D Marple, New York Hospital, "The Use of Anticoagulants in Thromboembolic Conditions with Particular Reference to Coronary Thrombosis and Myocardial Infarction," Dr Jere W Lord, Jr, New York City, "The Surgical Treatment of Portal Hypertension," and Dr Lester R Dragstedt, chairman, Department of Surgery, University of Illinois, College of Medicine, "The Evaluation of the Results of Vagotomy"

Fulton County

Postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Society was held for members of the Fulton County Medical Society on September 23 at Gloversville Dr Walter F Rogers, Jr, instructor in medicine, Syracuse University College of Medicine, spoke on "The Management of Diabetes" The instruction was provided in cooperation with the State Department of Health.

Kings County

The joint committee on postgraduate education of the Kings County Medical Society and the Long Island College of Medicine have announced a postgraduate course in "Diagnosis and Treatment of Neoplastic Disease" to be given at the Brooklyn Cancer Institute, Kings County Hospital, Brooklyn Sixteen sessions will be held for eight weeks, from 2 to 3 P M on Mondays and Thursdays, beginning October 11 Ward rounds will be Mondays through Fridays from 11 A.M to 12 NOON

Designed for physicians interested in obtaining further instruction in the diagnosis and treatment of cancer and related diseases, the course will consist of ward rounds, clinics, round table conferences, and lectures which will include the entire field of neoplastic disease X-ray diagnosis and other laboratory procedures will be discussed along with clinical manifestations, histopathologic demonstrations will be included, and methods of surgical and radiologic treatments will be outlined

Monroe County

The eighteenth season of medical broadcasts sponsored by the Monroe County Medical Society over Station WHAM, Rochester, opened on September 4 Broadcast every Saturday morning at 9 45 A.M., the programs this year will follow the theme, "Speaking of Health"

September programs included September 4—"Modern Medical Care", Rochester Hospital Service Corporation and Genesee Valley Care, Inc, September 11—"Child Safety", Dr Albert D Kaiser, Mr Edwin S Smith, September 18—Public Relations Committee, Dr Charles S Lakeman, and September 25—"Coronary Artery Disease", Dr Eli A. Leven and the Heart Committee

Onondaga County

Dr Leo M Taran, director of St Francis Sanatorium for Cardiac Children, Roslyn, will speak on "The Treatment of Rheumatic Fever" at the meeting of the Onondaga County Medical Society to be held Tuesday, October 5 at the University Club, Syracuse The program is postgraduate instruction arranged by the Council Committee on Public Health and Education with the cooperation of the State Department of Health

Wayne County

Members of the Wayne County Medical Society and its Woman's Auxiliary held a joint dinner and meeting August 10 at Sodus Bay Heights Gold Club, with Dr James Arseneau, Lyons, president, acting as chairman Principal speaker was Dr J A. Reed, Newark, who gave a talk on "Medical Practices, Past and Present"

INFANT MORTALITY

The work of the Special Committee on Infant Mortality of the Medical Society of the County of New York has been greatly hampered by lack of autopsy reports on neonatal death certificates and stillbirth certificates Since it is the function of this committee to endeavor to reduce infant mortality, it is essential that accurate pathologic diagnoses of the causes of death be available It is only in this way that an intelligent attack can be brought to the problem of reducing the incidence of stillbirth and neonatal death

In this connection the New York City Department of Health has recently pointed out that the City of Chicago is far ahead of New York in the notable record it has made in its program for the care of mothers and newborn infants, a feature of which is the intense interest of obstetricians, pediatricians, and pathologists in the cause of infant deaths and stillbirths

The New York City Department of Health has appealed to the medical profession for cooperation in making available better information

The Society's Special Committee on Infant Mortality seconds the appeal Since the greatest proportion of neonatal deaths occurs in hospitals, the autopsy problem is a comparatively simple one, if the profession at large, particularly the obstetricians and pediatricians, can be made to realize the importance of complete gross and microscopic postmortem examination in all infant deaths

This request of the Infant Mortality Committee and the Health Department would seem to be one worthy of careful consideration by the profession — *New York Medicine, July 5, 1948*

HOSPITAL NEWS

Occupational Therapy Training for Women Announced

A TEN WEEK training course for women volunteering as aids in occupational therapy divisions of hospitals will open in New York City, October 14 it was announced at the annual convention of the American Occupational Therapy Association in August.

The course is jointly sponsored by the New York State Association of Occupational Therapists and the Junior League of the City of New York and is designed for those with the leisure to permit attendance at classes three nights a week. Representatives of the United Hospital Fund the New York City Visiting Committee and the Museum of Modern Art will assist in the course, the State association said

Those completing the course will qualify as aids to professional therapists who serve on the staffs of veterans, voluntary and municipal hospitals. Registration will be held from October 5 through October 7 at the office of the Occupational Therapy Assistants Training Courses, 590 Madison Avenue, New York City

Postgraduate Course to Be Held at Brooklyn Cancer Institute

AN EIGHT-week course, consisting of sixteen sessions in the diagnosis and treatment of neoplastic disease, will be given at Brooklyn Cancer Institute, Kings County Hospital, Brooklyn, beginning October 11 Sponsored by the Joint Committee on Post-Graduate Education of the Medical Society of the County of Kings and the Long Island College of Medicine the courses will be given by Dr William E. Howes and the staff of the Institute.

They will be held from 2 to 3 P.M. on Monday and Thursday afternoons, with ward rounds Mondays through Thursdays from 11 00 o clock to 12 noon.

This course is designed for physicians interested in obtaining further instruction in the diagnosis and treatment of cancer and related diseases. It will consist of ward rounds, clinics, round table conferences, and lectures which will include the entire field of neoplastic disease. X-ray diagnosis and other laboratory procedures will be discussed along with clinical manifestations Histopathologic demonstrations will be included Methods of surgical and radiologic treatments will be outlined.

Veteran physicians may apply under the G I Bill, but must present a Certificate of Eligibility Veterans who have previously submitted Certificates to the Committee do not need a new one to re-enter training, provided they have not taken courses elsewhere since filing the Certificate with the Committee. A supplemental Certificate is required only if the veteran has interrupted his training by taking postgraduate courses elsewhere

To make application or to obtain further information call STerling 3-6900 or address The Registrar Joint Committee on Post-Graduate Education, Medical Society of the County of Kings 1313 Bedford Avenue, Brooklyn 16, New York.

Blue Cross to Pay Extra $2,500,000 to New York Hospitals

TO HELP New York hospitals solve the problem of inflationary costs, Associated Hospital Service—New York's Blue Cross Plan—has adopted a new formula which calls for at least $2,500 000 in extra payments to its 200 participating hospitals during the next year, it was announced recently by Louis H. Pink president. The formula provides for payments to be revised periodically on a quarterly basis in an upward or downward direction depending on living costs. Since prices are rising, the total paid to hospitals at the end of the year may exceed the amount anticipated at this time, Mr Pink explained.

AHS payments to hospitals for 1948 including the cost-of living supplementary payments, are estimated at more than $32,000 000

The new formula, which went into effect on behalf of all Blue Cross members admitted to hospitals on and after September 1, has been approved by the State of New York Insurance Department and endorsed by the United Hospital Fund, the Greater New York Hospital Association, a special committee of hospital presidents and trustees and the Hospital Advisory and Public Advisory Committees of Associated Hospital Service

Courses Offered for General Practitioners and Psychiatrists

THE New York Medical College Flower and Fifth Avenue Hospitals has announced the following courses for general practitioners and psychiatrists:

'Readings in Psychoanalytic Literature (Second Part) consisting of fifteen sessions and beginning on October 5 1948, will be held on alternate Tuesday evenings at 8 30 P.M. A Seminar in Psychosomatic Medicine will begin on October 6 and will be held for twelve sessions on Wednesdays at 8 30 P.M. 'Introduction to Psychoanalysis, consisting of ten lectures, will begin on October 11 to be held on Mondays at 8 30 P.M A course in 'Psychiatry and Psychoanalysis will begin on February 9 1949 and will last for fifteen sessions, being held on Wednesday evenings at 8 30 P.M.

Application should be made through the Office of the Dean New York Medical College, Flower and Fifth Avenue Hospitals 1249 Fifth Avenue, New York City 29

Fees for the first three courses are $40 for each course. Fee for 'Psychiatry and Psychoanalysis' is $30

Brooklyn Jewish Hospital Agrees to Train Unit for Army

THE United States Army Medical Department and Jewish Hospital, Brooklyn, signed an agreement in August under which the hospital will organize a medical unit trained for instant use by the Army in case of any national emergency

Colonel Roosevelt Cafarelli, of the Army Medical Department, representing Major General Raymond W Bliss, Surgeon General of the Army, said that four other New York hospitals had agreed to organize similar mobile units These are Queens General Hospital, Presbyterian Hospital, Mount Sinai, and the Kings County Hospital, he said

In Washington, Army representatives said that such units are being organized in hospitals throughout the United States as part of the nation's reserve mobilization program They will be expected, it was said, to meet any emergency which may arise

In the agreement the Jewish Hospital plans to hold quarterly training periods for personnel participating in the program, and to make available at no expense to the government adequate space for classroom facilities and for storing equipment

While the Army will not direct the unit, it will, Colonel Cafarelli said, lend its medical experts to address classes on technical subjects and will advise on the training programs Emphasis will be placed on coordination as a unit, and the rules, regulations, and practices of the Medical Corps, so that the group might shift smoothly to Army direction should any national emergency develop

Admission Rates for Public Mental Hospitals Increase

THE "first admission" rate to public mental hospitals during 1946 was 88 4 per 100,000 of the population for the country as a whole, and for the same year the hospitalization rate was 372 2, according to figures of the Mental Hygiene Division of the Public Health Service

These rates showed considerable variation from state to state The "first admission" rate ranged from a high of 146 3 in New Hampshire to a low of 58 1 in Indiana, and the corresponding range for the hospitalization rate was from 593 9 in New York to 206 1 in Utah Although this variation may reflect to some degree differences in the extent of mental illness from state to state, it is much more likely that it represents differences in the extent of the facilities available for the care of the mentally ill, the rate of turnover in hospitals of the type under consideration, and other administrative factors

The figures are based on the results of the 1946 Census of Patients in Mental Institutions, collected and tabulated by the Bureau of the Census, Department of Commerce Collection of these data was made a function of the Mental Hygiene Division, Public Health Service in February of this year in view of the Service's increased responsibilities under the National Mental Health Act.

Since patients in private mental hospitals are not necessarily hospitalized in the states in which they reside, the rates are based on statistics for public hospitals only The statistics on veterans hospitals are adjusted figures based on tabulations prepared by the Division of Medical Research Statistics

NEWS NOTES

At the July 12 meeting of the staff of St Francis Hospital, Poughkeepsie, Dr J J Toomey presented a case report on intraperitoneal cyst of presumably traumatic origin. The discussion was by Dr M M Simon At the August 9 meeting Dr Louis Ferraro presented kodachrome studies of specimens

• • •

Dr Claude E Forkner, New York City, presented a discussion on "The Diagnosis and Treatment of Leukemia" at the June 23 meeting of the Sharon Hospital staff, Sharon, Connecticut

• • •

Plans are underway for the building of a new wing to Wyckoff Heights Hospital, Brooklyn, which will add 100 beds to the present capacity of the hospital. This will increase the hospital's capacity one-third, making a total of 300 beds and bassinets

• • •

A week-long series of conferences was sponsored in August by the Council of Rochester Regional Hospitals About 100 persons, representing hospital staffs of 11 counties, attended the conference Miss Esther N Thompson, council nursing associate, was in charge of the program, and the meetings were held in the Catherine Strong Hall of the University of Rochester

•

Completion of several remodeling projects for St Luke's Hospital, Utica, has been announced by Carl P Wright, Jr , director of the hospital. The work, in the process of planning and construction for several months, is part of a general renovation program

An extensive remodeling of the maternity floor—including enlargement of both delivery and nursery facilities—and creation of a private admissions office for incoming patients were cited especially as alterations designed to improve patient comfort Another change—the setting up of a central sterile supply room for the entire hospital—was considered essential by the State Board of Nurse Examiners in connection with the approval of St Luke's Nurse Training School.

• • •

The Olean Medical Group, the first group practice medical center in the Buffalo area, was opened in August The medical staff comprises Dr William C Goodlett, Dr Norman P Johnson, Dr A. L

Runals, Dr Wilber J Manley, and Dr Fred W Kehr Upon call will be Dr Leslie J Atkins, consulting urologist, Dr Leo D Moes, consulting pathologist and Dr Murray Reswick, consulting roentgenologist.

The expansion of Albany Hospital is being planned, according to an announcement from the hospital. The new bed section of the addition would provide 37 beds for neurosurgery, 38 for thoracic and plastic surgery, 26 for pediatric cases, and 20 admitting unit beds for overnight patients.

The hospital at present has a capacity of 541 beds and 30 bassinets, but is overcrowded with 60 additional beds and 18 bassinets set up

The new addition also would provide lecture rooms and laboratories for the expanding school of nursing The new outpatient department would provide a diagnostic clinic and mental hygiene clinic. The present outpatient department would be used for locker and rest rooms, the medical records department, and housing for staff members.

PERSONALITIES

Appointments

Dr Jesse Donald Stark, director of radiology, Gouverneur Hospital, New York City as expert Civilian Consultant to the Surgeon General in the occupied European zone. Dr Stark will devote a month to visiting, with three other appointees, the United States hospitals in Germany and Austria to promote and further improve the quality of medical instructional facilities in the field of radiology As coordinator at the Staten Island Hospital, Dr John S Snider who will guide the interns in their courses of instruction as facilitated by the New York Committee for the Study of Internships and Residencies.

Dr Herman B Snow, supervising psychiatrist of Binghamton State Hospital, as assistant director of Utica State Hospital As chief surgeon of the A. Barton Hepburn Hospital Ogdensburg, Dr John L. Free succeeding the late Dr G C Madill To the medical board of St. Vincent s Hospital Staten Island, Dr Mather Cleveland, consultant in orthopedics, Dr Thomas Mulcahy, to the attending staff in urology, and Dr Joseph Hulnick adjunct in gynecology

Dr Joseph Levi, formerly chief clinical psychologist, Veterans Administration Hospital Bronx, as research psychologist, Institute of Rehabilitation New York University Bellevue Medical Center

---

WARN EX-SYPHILITIC VETS

A warning is being issued to veterans who were treated in service for syphilis with penicillin that they need periodic checkups because there is a possibility that between 20 and 30 per cent of these cases were failures officials of the Veterans Administration stated.

The old Army treatment for the disease with arsenic and bismuth was time-tested, and results were therefore predictable. The disadvantage in this twenty-six-week treatment was that one out of every 30 000 was killed, while penicillin has proved superior without killing any patients. However, penicillin treatment is still in an early stage. It will require about twenty years study and follow-up to determine the effect on the patient.

Meanwhile, Uncle Sam is worried about the boys who received treatment and thought themselves cured, because in many cases the patient received either inadequate treatment, because of discharge did not get the necessary blood and spinal fluid tests required for a year after treatment, or was discharged before he got an examination of his spinal fluid.

Syphilis, if not treated or inadequately treated, *may attack the heart and nervous system and therefore* in many cases leads to insanity Officials estimate that each case of insanity in a veteran costs the taxpayer $40 000 from the time the patient is admitted to a hospital until his discharge.

They estimate that approximately 400 000 veterans were treated while in service in the armed forces. About 52 000 veterans were treated in 1946 following their discharge but there is no way of telling what proportion were infected after they got out and which of them were relapse cases No one has followed Army cases long enough

The officials of the Veterans Administration cautioned that without preventive action now, syphilis in veterans will cost the taxpayer around one billion dollars in the course of the next twenty-five years.—*Science News Letter August 7, 1948*

FORTY-SECOND ANNUAL MEETINGS

of the

DISTRICT BRANCHES

of the

MEDICAL SOCIETY OF THE STATE OF NEW YORK

PROGRAMS

Second District Branch

Wednesday, October 20, 1948
Garden City Hotel
Garden City, New York

Morning Session

10 30 A.M —Symposium on Rheumatic Fever

"Rheumatic Heart Disease in Children"
Leo M Taran, M D , medical and research director, St Francis Sanatorium for Cardiac Children, Roslyn

"Experimental Viral Carditis" (with lantern slide illustrations)
John M Pearce, M D , professor of pathology, Cornell University Medical College

"The Diagnosis and Treatment of Rheumatic Fever"
William Dock, M D , professor of medicine, Long Island College of Medicine, director of medicine, College Division, Kings County Hospital

Business Meeting, Election of Officers

12 30 P M —Luncheon

Remarks by Mrs Edgar M Neptune, president, Woman's Auxiliary to the Medical Society of the State of New York

Address by John J Masterson, M D , Brooklyn, president-elect, Medical Society of the State of New York

Afternoon Session

2 30 P M —"Newer Concepts of the Autonomic Nervous System"

L Corsan Reid, M D , associate professor of physiology, New York University, College of Medicine

The Woman's Auxiliaries of the four county medical societies on Long Island will attend the luncheon and will hold a meeting at the Garden City Hotel in connection with the meeting of the Second District Branch (Notice of this meeting will be mailed to the members of each of these auxiliaries) Bridge will follow

Officers—Second District Branch

President	John B D Albora, M.D Brooklyn
First Vice-President	Charles C Murphy M D Amityville
Second Vice-President	Thomas M D Angelo M D Jackson Heights
Secretary Treasurer	Charles F McCarty M D, Brooklyn

Presidents of Component County Societies

Kings	A W Martin Marino M D Brooklyn
Nassau	Harold A Butman M D Manhasset
Queens	Alfred Angrist, M D, Jamaica
Suffolk	Wilbur S Stakes M D Patchogue

First District Branch

Tuesday, October 26 1948
St. Luke's Hospital
Newburgh New York

Morning Session

Golf at the Powelton Club

Afternoon Session (St. Luke's Hospital)

2 00 P.M.—'Cancer and the General Practitioner' John C A. Gerster M.D New York City assistant professor of clinical surgery, Cornell University Medical College clinical professor of surgery, New York University College of Medicine

'Trends in Diagnosis and Treatment of Cancer of the Uterus

Howard C Taylor Jr, M D, New York City professor of obstetrics and gynecology, Columbia University College of Physicians and Surgeons

Business Meeting, Election of Officers

Evening Session (Powelton Club)

6 30 P.M.—Dinner

Introduction of officers of the Medical Society of the State of New York

Address by John J Masterson M D Brooklyn president-elect

Remarks by Mrs. Edgar M. Neptune president, Woman's Auxiliary to the Medical Society of the State of New York

'Medical Economics' James R. Miller M.D., Hartford, Connecticut trustee, American Medical Association

Ladies will join the members of the District Branch for dinner

Officers—First District Branch

President	Harold F Morrison, M.D Tuxedo Park
First Vice-President	Stephen R Monteith, M.D Nyack
Second Vice-President	Wm. Crawford White M.D, New York City
Secretary	I J Landsman M.D Bronx
Treasurer	Henry W Miller M.D Brewster

Presidents of Component County Societies

Bronx	R. J Azzari, M.D Bronx
Dutchess	Louis W Stoller M.D., Poughkeepsie
New York	William B Rawls, M.D New York City
Orange	Theodore R. Proper M D., Newburgh
Putnam	Robert S. Cleaver M.D Brewster
Richmond	Joseph H. Diamond, M D New Brighton
Rockland	George G Stone M.D Suffern
Westchester	William G Childress, M.D Valhalla

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

At its meeting on June 10, 1948, the Council considered the following matters, taking action as indicated

Secretary's Report

Remission of State Assessments—Remission of State assessments was voted on account of service with the armed forces for one member for 1948 and three for 1947, also on account of illness for Edward M Wells of Rensselaer County for 1947 and 1948

Your Secretary has endeavored to make a commencement of the work set out for him by your recent House of Delegates Matters referred to the Council are being routed to you as fast as possible

On June 1, your Secretary conferred with Mr Arthur F Duffy, New York State Commander of the American Legion, at his office in Jamaica, Long Island, regarding Veterans Medical Service Plan of New York, Inc

In accordance with a communication received from Dr Joseph S Lawrence, director of the Washington Bureau of the American Medical Association, letters were sent to each county medical society president and legislative committee chairman, each Woman's Auxiliary county chairman and executive committee chairman requesting that they write to their representatives in Washington urging opposition to Section 4(C) of H R 6401 which calls for drafting members of our profession up to the age of forty-five years Mr Thomas E Walsh of the Public Relations Bureau was most helpful in quickly accomplishing Dr Lawrence's desires

In accordance with the spirit of a resolution passed at your last meeting, a letter was written to Senator Ives urging that the 1948 Republican Party Platform contain a plank opposing socialized medicine and endorsing the American spirit of free enterprise in professions and business I have also talked to Miss Jane Todd on this subject, and expect to contact Miss Mary Donlon, who is a member of the Platform Committee

Last Thursday morning was spent in conference with Dr Herbert Bauckus, president of Veterans Medical Service Plan of New York, Inc , Dr Harding and Dr Kleinman of the U S Veterans Administration Most of the afternoon was allotted to the Annual Meeting of Veterans Medical Service Plan of New York, Inc

Representatives of the Medical Societies of the Middle Atlantic States concerning National Emergency Preparedness met on Tuesday, June 8, in Philadelphia There were 18 gentlemen present, (including Dr Chas Gordon Heyd and myself) representing New York, New Jersey, Pennsylvania, Maryland, the District of Columbia, and Virginia Delaware was not represented Dr Colby Engel conducted the meeting in a fine way

The consensus of opinion was that this was an exploratory meeting They decided they would hold themselves in readiness for a future meeting at the call of the chairman Dr Engel was elected chairman Dr Fetter, also of Philadelphia, was elected vice-chairman, and Mr Irwin, the executive secretary of the Philadelphia County Medical Society, was elected secretary

It was felt that in case of an atom bomb the matter to be prepared for beforehand divided itself into three spheres (1) public health services, (2) administrative services, and (3) medical care services

Communications—1 Letter from Dr Thomas M D'Angelo, chairman of the Malpractice Insurance and Defense Board, dated May 20, 1948, re work of Mr Joseph Linder in connection with the Malpractice Insurance and Defense audit and report

It was voted that the Secretary be instructed to write a letter to Mr Joseph Linder expressing appreciation for his work in connection with the audit of the account of the Malpractice Insurance and Defense Board and for his appearance at the House of Delegates

2 Letter from John A Kenny, editor, National Medical Association, Inc , 39 Madison Avenue, Montclair, New Jersey, requesting permission to publish in the *Journal of the National Medical Association* the resolution regarding acceptance for membership of doctors in county medical societies irrespective of race, color, or creed

It was voted that the Secretary reply stating that this organization has a perfect right to quote anything that has come through the press

3 Letter from Dr Ap Pyrghialis, president, and Dr Alex Valsamakis, secretary, Medical Association of Magnesia, C Glavani Street No 10, Volos, Greece, under date of March 26, 1948, requesting that we, "as a free democratic people of the world, raise a voice of protest to the other civilized people in the world, in order to cease these crimes of the bandits against the young children of Greece"

It was voted that this letter be referred to the American Medical Association with a request that if they do not care to answer it, they advise us how we should

4 Letter from Dr Foster Murray, dated May 25, 1948, giving list of officers elected for the new Section on Chest Diseases and requesting confirmation thereof

It was voted that the officers selected by the new Section on Chest Diseases be confirmed

5 Letter from Dr Louis H. Bauer, secretary-general of the World Medical Association, under date of June 2, 1948, as follows

Dear Dr Anderton

The Council of the World Medical Association has asked me to express to you their appreciation of the courtesies of the association in tendering them a dinner on the evening of April 28 at the Hotel Biltmore

The Council was also most enthusiastic about all the courtesies shown to them while they were here.

6 Letter from Senator Irving M Ives, under date of June 5, 1948, as follows

Dear Dr Anderton

Your letter of May 27 has been received and I have noted the recommendation you make with regard to the 1948 Republican Platform. You may be sure that I shall be most opposed to any plank favoring socialized medicine

The very kind thought regarding myself which you express is greatly appreciated.

With kindest personal regards I remain

7 Letter from Dr John C McClintock, secretary of the Committee on Thyroid Cancer of the American Association for the Study of Goiter, under date of May 24, 1948, expressing appreciation for kindness extended to him and the excellent manner in which the Annual Meeting of the State Society was conducted

Treasurer's Report was Accepted.

Report of Executive Officer

Dr Hannon reported he had been busy making arrangements for the fall meetings in the district branches He stated he had attended a meeting called by the Department of Education with a group from New Jersey represented by the ex-governor, Mr Moore, the president-elect, and past president of the New Jersey State Medical Society and two members of the exchange board for the purpose of considering reciprocity and endorsement of licenses between New Jersey and New York. Senator Hammer and Dr J Stanley Kenney of our Council were also present. The New York endorsement of New Jersey licenses was stopped in 1940, and New Jersey refuses to endorse a New York license.

After a lengthy discussion it appeared that the New Jersey Board of Medical Examiners has raised its standards sufficiently for the Department of Education and the Committee on Endorsement of License to consider endorsing New Jersey licenses issued after 1947 and with that it would appear that New Jersey would then consider endorsing New York State licenses.

Activities of Committees

Legislation.—Dr Aranow chairman, stated that next year he thought the different groups that wished legislation introduced should get together and agree on just what they wanted so that his committee would not be embarrassed by disagreements among the various groups.

Constitution and Bylaws.—Dr Reuling chairman reported as follows

There is one item received from New York County accompanied by a long letter which I will not read They have adopted a change in Bylaws relative to malpractice amending Article 2 of Chapter VIII of the Bylaws by adding at its end a new sentence to read as follows

Rulings of the Censors and of the Comitia Minora in any matter properly before them shall be binding upon the members involved therein unless and until such rulings shall be modified, revised or reversed upon appeal or by a court of competent jurisdiction and interpretations of the Principles of Professional Conduct of the Medical Society of the State of New York and of the By laws of this Society (including appendices) made by the Censors or by the Comitia Minora other wise than in the course of a matter before them shall be binding generally upon the members upon approval thereof by a majority vote of the members present at any annual or stated meeting of the Society noticed for that purpose

The counsel of the Society sees no objections, and I think the majority of the committee also find no objection to it. I move its approval.

It was voted that this change be approved

Convention.—Dr Wertz, chairman reported that there were two dates open at the Hotel Statler in Buffalo the weeks commencing May 2 and May 23 for the 1949 Annual Meeting of the Society He thought the Committee should consider these dates and where the Meeting should be held in Buffalo

After discussion, *It was voted* that the date and place of meeting in Buffalo be left to the Convention Committee.

Economics.—Mr Farrell director of the Bureau of Medical Care Insurance made the following report

TABLE 1.—MEMBERSHIP PROGRESS—ACCORDING TO TYPES OF CONTRACT—QUARTER ENDING MARCH 31 1948

* Paid basis; all others on incurred basis.
Note: Experience of Medical and Surgical Care Inc. Utica, includes benefits under medical call rider

Total membership at March 31 1948 was 1 153 - 189 an increase during the quarter of 129 574 which exceeded by 12 070 the increase for the correspond ing period in 1947

Incurred benefits to members was $1,208,051, as compared to $792,244 for the same period in 1947 representing an increase of $415 807 or 52 per cent.

Finance.—Dr Andresen, chairman, submitted the revised budget for the last six months of the year ending December 31, 1948 This was approved and referred to the Board of Trustees.

Medical Licensure.—Dr Strohm, chairman, reported verbally

"I just received yesterday a letter from the Medical Society of the County of New York in which they make some recommendations to the Council concerning qualifications for applicants for licensure in New York State Some of them are in effect. One or two of them have been tried again and again I would beg your indulgence to give a more complete report on this at our next Council meeting because I have really not had time to look the thing over carefully but I think it was pretty well covered in the Annual Report of the Committee on Medical Licensure.

Office Administration and Policies.—Dr Ander ton reported for Dr Masterson, the chairman, that the committee had met on June 9 and routine business was transacted It had no recommenda tions to make to the Council

Public Health and Education.—The report as distributed with the Agenda is as follows

Activities of the Chairman.

June 3 1948 In Syracuse attended the Semi-Annual meeting of the Board of Directors of the American Cancer Society New York State Division

June 4 1948 In Syracuse attended a meeting of the Executive Committee of the Fifth District Branch.

June 9, 1948 In New York City a meeting of the Council Committee on Public Health and Education and the Subcommittee on Cancer was held with representatives of the New York State Department of Health Some of the officers of the Medical Society of the State of New York were also present at this conference

Subcommittee on Hard of Hearing and the Deaf.—The following report was submitted by Gordon D Hoople, M D chairman

"On May 17 1948 in New York City, the chair man of the Subcommittee on Hard of Hearing and the Deaf conferred with Dr Morton L. Levin, Dr Leon Sternfeld, and Dr I Jay Brightman of the State Department of Health There is the possibility of allocation of some State and national funds for the work of the program of conservation of hear ing in New York State. Considerable progress was made at this meeting These individuals were in formed of some of the needs of the program and were instructed how from the otologists standpoint they should be met. Your chairman was informed by them of some of the difficulties and after con-ference ways of eliminating blocks were discussed They felt confident that some measures of worth, from a financial standpoint could be brought about.

Postgraduate Instruction.—Postgraduate instruc-tion has been completed in the following counties Allegany Chemung Clinton, Genesee, Madison Nassau Oneida, Ontario Oswego, Queens, St. Lawrence Saratoga, Seneca, Suffolk, Sullivan Tioga, Ulster and Westchester

Arrangements have been completed for a sym posium to be presented at a joint meeting of the Rockland County Medical Society and the Rockland County Dental Society on June 16 1948 in Pomona.

Postgraduate instruction will be given in the near future in Chenango and Otsego Counties

A request has been received from the Sullivan County Medical Society for instruction to be pre-sented in the fall

We hope to have the 1948–1949 Course Outline Book ready for mailing as soon as possible. The material is being compiled and will be sent to the printer within a short time.

Subcommittee on Cancer.—Dr Anderton sub-mitted the following report of a meeting held on June 9 1948 for Dr Post chairman of the Subcommittee on Cancer

There were ten gentlemen present, representing the Medical Society of the State of New York, the Cancer Society and the New York State Depart-ment of Health The meeting considered and ap-proved a program of cancer control of the Bureau of Cancer Control of the New York State Depart-

ment of Health That is a splendid and inclusive report It is fair to explain that it reaches into the realm of idealism in certain of its parts, and it was arranged with that intention at the start

"Second, there was referred by this Subcommittee on Cancer to a subcommittee composed of Dr Aide and Dr Gerhart the formulation of a blueprint for detection clinics, that is the idea was that they will bring to the committee next time a plan for the setting up of a cancer detection clinic

"Also they will bring in a report or statement of qualifications for fellowships in the study of cancer The State Department of Health allots certain sums to men in order to take postgraduate study in the subject of cancer, and this Subcommittee will bring in recommendations which will be sent to the Health Department from this body eventually regarding qualifications that men should have in order to receive those fellowships from the State Department of Health

"Also referred to this Subcommittee was the subject of recommendations for a plan for tumor clinics"

Planning Committee for Medical Policies—Dr Kenney stated that the House of Delegates had continued this special committee of the House of Delegates and reminded the Speaker that it was his prerogative to appoint six members

Committee on Public Relations—Dr Winslow, chairman, presented the following report

"Considerable success was achieved by the Public Relations Bureau in reaching the public through publicity emanating from the 142nd Annual Meeting Clippings are being received almost daily from newspapers throughout the State, indicating an unusually wide coverage of the meeting by the press During the meeting, the press room set up by the Public Relations Bureau was a center of activity for approximately 20 representatives of newspapers, wire services, and periodicals Daily coverage was provided by the leading New York newspapers and wire services On two occasions stories in the *New York Times* were played up on the first page, and both the *Times* and the *Herald Tribune* devoted editorials to certain actions taken by the House of Delegates The Public Relations Bureau sent four special mailings to the city and State press during the course of the meeting and also arranged for the distribution of photographs of the incoming and retiring officers of the Society and of the Woman's Auxiliary

"In response to a mailing of approximately 2,500 copies of *20,000 Years of Service*, the commemorative booklet honoring those physicians in New York State who have practiced medicine fifty years or more, a large number of laudatory and appreciative letters have been received Thirty-six personal letters from the fifty-year men expressing their pleasure in having been included in the booklet were among this number, and there were 97 others from other state societies, officials of the American Medical Association, librarians, and friends of the Society A sampling of the comment contained in these letters indicates the success which the booklet achieved in fulfilling its purpose Some of these comments are

'Thanks very much for the copy of *20,000 Years of Service* I feel too highly complimented'—Dr Nathan B Van Etten, Past-President of the American Medical Association

'This certainly took a lot of work but the final result was worth the effort.'—Dr George F Lull, Secretary and General Manager of the American Medical Association

'I will treasure it always'

'It was a splendid thought and beautifully developed'

'These lines are to express my heartfelt gratitude for putting my name and likeness in such illustrious company'

'The booklet accomplishes its purpose admirably'

'We old-timers are made very happy that we should have been so handsomely remembered by our State Society'

'Thank you for the lovely thing you have done'

'It was a very gracious gesture on the part of our Society to bestow this honor on us in recognition of fifty or more years of service—an honor I shall cherish the rest of my life'

"Certificates have been mailed to 130 member physicians who reached the fifty-year mark during the past year

"A News Letter was mailed on May 5 calling attention to the Teaching Day program during the Annual Meeting and describing the steps being taken by certain county societies to provide round-the-clock medical service in cases of emergency A bulletin of the Investors League, Inc, expressing opposition to the Wagner-Murray-Dingell Bill, was attached to the News Letter

"During the course of the month a newspaper release based on an editorial in the NEW YORK STATE JOURNAL OF MEDICINE on the use of penicillin as a prophylactic in the eyes of newborn children was sent to New York State dailies and the JOURNAL exchange list

"The following postgraduate sessions, held under the auspices of the Committee on Public Health and Education, were covered by releases to the press Clinton, Fulton, Genesee, Jefferson, Madison, Rockland, and Sullivan

"The Public Relations Bureau prepared a letter to all county presidents and legislative chairmen and members of the Woman's Auxiliary urging them to write their congressmen in opposition to that portion of the proposed selective service act which would require registration of physicians up to the age of forty-five

"Mr Walsh represented the Society at the National Health Assembly in Washington, May 2 to 5 During the course of the month he visited Monroe, Nassau, Orange, and Cayuga counties and spoke on the need of a committee on public education and a speakers' bureau, and in Kings County he spoke on the subject of socialized medicine"

Publication—Dr Kosmak, chairman, reported that the Publication Committee met on June 9, 1948 Many routine matters were considered He stated the Committee had approved a supplement to the JOURNAL containing the Minutes of the 1948 Annual Meeting of the House of Delegates The cost of this has been estimated at about $3,000 It is proposed that this sum be taken from the proceeds of the Annual Meeting, provided the surplus is sufficient, otherwise it was proposed that it be left to the discretion of Mr Anderson as to how much of this money can be taken from the advertising income of the JOURNAL

It was voted that the Publication Committee be granted leave to print a supplement to the JOURNAL containing the minutes of the last meeting of the House of Delegates and to accept advertising therefor, the difference in cost to be allo-

cated from the convention fund if there is sufficient, of if not, from the JOURNAL fund.

Committee on Liaison with Veterans Administration.—Dr Bauckus chairman, reported as follows

"I would not have come to the Council meeting today except we have a meeting of our Board of Directors this afternoon to consider some very important matters.

"I would like first to say that the contract with Veterans Administration is supposed to end June 30 1948 Unless we have a new contract with the Veterans Administration the Veterans Medical Service Plan will have nothing further to do That will mean the loss of our contract and the loss of our contracts with our coordinators.

"Dr Harding will meet us again next Thursday with Dr Anderton and myself to discuss the work of the clinics here. Frankly he would like to take the work of the coordinators and put it into his own department.

'As chairman of the Committee from the American Medical Association, I have secured information about how the plan works in various states and in some it works very well indeed. Some of the reports indicate that the medical profession of the State is fairly well pleased with the work. This is of course an indication that there is a great variation in the way the Veterans Administration carries on its care of the veteran in the service-connected case. We know from statistics that we are not getting our share of fee basis work in New York State.

'I have a letter from the Medical Director of the California Physicians Service that says in part

I am enclosing a record of the activity of this program during the past year together with a statement of the amount of money involved and the number of veterans treated As you will note from these figures the program is steadily growing Most of the administrative problems have been ironed out and the operations are comparatively smooth. Our contract is on a cost plus basis so in addition to the amount of authorizations listed administrative expense is in addition. Very cordial relations exist between the C.P S and the branch office of the Veterans Administration.

'The Michigan Medical Service sent their executive, Mr Castaluzzi to see me in Buffalo to describe what they were doing and they have a very good program working through a similar so-called Blue Shield Plan. He tells me that several times they have had to go to Washington to protest certain acts of the Veterans Administration in Michigan but that generally they have received approval of what they wanted to do He said that the veteran was quite confident that he could have free choice of physician and demanded it that the Medical Society went along with that, and they were able to control the program very well.

'By the way, in California one month in 1947 they had $246 000 of authorizations the next month $206,000 It went down to $200 000 in November in March, 1948, $284,000 in April 1948 $287 000 I call your attention to the fact that there is quite a difference between the way they are working in California and the way they are doing in some of the other states.

'I will read one more item from the State of Indiana, in which the Executive Secretary says in part

'Home town care by family physician under agreement with VA existent Indiana since November 1946 satisfactory plan with minimal administrative difficulties but gradually reduction in such service has accompanied increased facilities in VA Regional Office with 16 to 18 full-time physicians.'

I would say that that is somewhat along the line of what we have had here

"If the Veterans Administration does not make a contract with the Plan, or if they want to do it with the coordinators out of the picture, I doubt very much whether the Board of Directors will want to go along with the whole contract That will throw the whole thing before the Council. It will then be the responsibility of the Council of the Medical Society of the State of New York to do what we are doing now

"I would like to have use made very much of Dr Winslow s Committee on Public Relations I have asked for that several times. I think they could do a lot for us

"I notice the report this morning does not say anything about the Veterans Administration at all I don t think it is our business, the Board of Directors business, to do all of this propaganda and public relations work for the State Medical Society It is a suggestion I have to make that this work be put under the direction of some member of the Council or possibly placed in Mr Farrell s Bureau. We operate more or less as an independent organization and we have no one to look after us except as we request various men in the organization I think if we had Mr Farrell s cooperation we might make use of some of the public relations that he gets but the point is that the veteran does not know his rights are gradually being taken away from him. He does not appreciate what it means to have free choice of physician, and that is especially important when we have Workmen s Compensation free choice Furthermore if we lose in this matter we may have some attack on the question of free choice in Workmen s Compensation. New York State of all states should certainly stand for free choice of doctor by the veteran and that is the resolution your House of Delegates adopted. Whether or not under the present circumstances the Veterans Administration will continue the contract I do not know but I want to call to the attention of the Council that matters are now approaching a critical stage. We shall have a meeting this afternoon and we shall have a further report after that.

After discussion, *it was voted* that all facilities of the State Society be used to assist Dr Bauckus and his Committee.

Woman's Auxiliary.—Dr Beckman, chairman reported that he had received a letter from Mrs Neptune stating that she had organized her committees and had visited several county societies.

Workmen's Compensation.—Dr Kenney chairman, reported verbally that "a meeting was held with Miss Donlon on the 11th of May to discuss the problem of rating Also another meeting was held by our Committee at the Hotel Pennsylvania following the State Society meeting Thirty or forty representatives of different counties came and discussed informally some of their grievances. I will embody these matters in a more formal report for the September meeting'

New Business

Council Committee Appointments for the Year

1948–1949 —The list of council committees and subcommittees was submitted by the President and *approved* by the Council (The list will be published in the next issue of the JOURNAL)

Matters Referred from the House of Delegates to the Council

Section 77, House Minutes —Report of Reference Committee on Report of Council, Part XII Woman's Auxiliary

"We recommend to the Council that they recommend to the Board of Trustees that the appropriation be increased by $1,000", meaning appropriation for Woman's Auxiliary

It was voted that this recommendation be made

Section 79, House Minutes —Report of Reference Committee on Report of Council, Part XII Report of Committee on Questions on Ethics

It was voted to remove from the Principles of Professional Conduct of the Medical Society of the State of New York an addition entitled, "Publications for the Laity" which was appended to Section 31(b) It was also voted to "refer back to the Council for further study" the following proposed substitution

'Advertisements and Announcements of Publications for the Laity

"In the event that there is proposed any public announcement of or advertising in relation to any book or article or writing for the laity, such proposed announcement or advertising matter shall be submitted to the Council Committee on Public Relations prior to any public appearance of the announcement or advertising matter This reviewing committee shall render its opinion without unnecessary delay It shall be guided mainly by Section 31 of these principles of professional conduct, but shall be empowered to make such concessions as may be practiced and necessary, in considering the description of the title and contents of the publication, the professional standing and reputation of the author, and such other material through which the publisher may wish to arouse interest"

It was voted to refer this to the Committee on Ethics

Section 85, House Minutes —Report of Reference Committee on Report of Board of Trustees and Report of Treasurer

The Reference Committee recommended that the Council consider the advisability of discontinuing publication in the *Directory* of names of physicians in New Jersey and Connecticut until means can be devised to interest these physicians in defraying some of the cost of compiling and publication

It was also voted that the *Directory* be published every two years

The Council *voted* to refer this to the Publication Committee

Section 94, House Minutes —Report of Reference Committee on Report of Council, Part X Workmen's Compensation

It was

"*Resolved*, that the New York State Medical Society urge the Legislature of the State of New York, to amend the Workmen's Compensation Law to abolish the Medical Practice Committee, be it further

"*Resolved*, that the support of the county medical societies outside the metropolitan area is urged in order to re-establish a uniform administration of the law through New York State"

It was voted to refer this to the Legislative and Workmen's Compensation Committees

Section 96, House Minutes —Report of Reference Committee on Report of Council, Part IX Workmen's Compensation

Approval was voted to the recommendation "that regional representation from the eight district branches constitute an Advisory Council on Workmen's Compensation Matters acting as a Subcommittee of the Council Committee on Workmen's Compensation"

It was voted that the President be empowered to appoint such a committee

A recommendation was adopted that the "chairman of the Workmen's Compensation Board arrange for a yearly consideration and review of the Fee Schedule and that Miss Donlon designate it as a 'Minimum Medical Fee Schedule' in accordance with the provisions of Section 13, Workmen's Compensation Law"

It was voted to refer this to the Workmen's Compensation Committee

A recommendation of the Reference Committee was adopted that steps be taken for settlement of disputed medical bills in the four counties having a population of over one million through arbitration by a committee consisting of five physicians

It was voted to refer this to Workmen's Compensation Committee for consideration and report

Section 100, House Minutes —Report of Reference Committee on Report of Council, Part III Salary Scales for Public Health Physicians in the New York State Department of Health

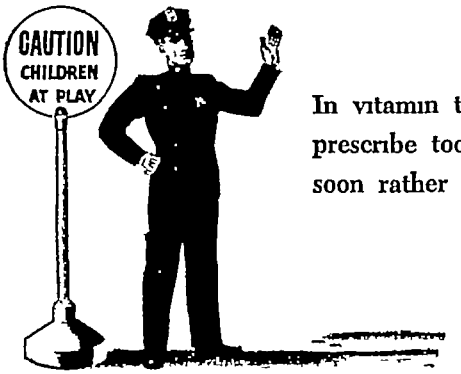
The following resolution was adopted with the recommendation that the Council carry out its provisions

"WHEREAS, the health and welfare of the State of New York are dependent in many ways upon the satisfactory operation and performance of services provided through the New York State Department of Health, and

"WHEREAS, upon investigation it is evident that these services are suffering from a lack of essential medical personnel, and

"WHEREAS, the Commissioner of Health is handicapped in making replacements of highly important specialists because of inadequate salary scales, and

"WHEREAS, present available salaries for public health and laboratory physicians in the State Department of Health are not commensurate with incomes earned by physicians of like experience and training, and



"WHEREAS, 48 out of 96 full-time medical positions in the State Department of Health remain unfilled as a result of the low salary scales now in effect, and

"WHEREAS, important public health programs and necessary research cannot be carried on because of these conditions, and

"WHEREAS, these deficiencies threaten the

Vitamin D	500 USP Units
Vitamin B_1 (Thiamin Hydrochloride)	3.0 mg
Vitamin B_2 (G) (Riboflavin)	3.0 mg
Vitamin C (Ascorbic Acid)	100.0 mg.
Nicotinamide	50.0 mg
Calcium Pantothenate	5.0 mg
Vitamin B_6 (Pyridoxine)	1 mg
Vitamin E (Mixed Tocopherols)	5.0 mg.

[Continued from page 2190]

health and welfare of the people of New York State, now, therefore be it

"*Resolved*, that the Medical Society of the State of New York respectfully petition the Governor of New York to take prompt action to rectify this situation by means of

"1 Upward salary scale revision,

"2 The delegation of greater latitude to the Commissioner of Health to permit recruitment of personnel above salary scale minimums, and

"3 Simplification of Civil Service recruitment procedures as they pertain to medical personnel"

It was voted that the secretary be instructed to communicate with Governor Dewey stating that the State Society favors an increase in such salaries

Section 102, House Minutes—Report of Reference Committee on Report of Malpractice Insurance and Defense Board

A recommendation was adopted that the Malpractice Insurance and Defense Board continue the Group Plan of Malpractice Insurance

Section 103, House Minutes—Report of Reference Committee on Report of Malpractice Insurance and Defense Board Malpractice Insurance and Public Relations

It was

"*Resolved*, that the Council of the Medical Society of the State of New York be instructed to study the Alameda County Plan, and as soon as feasible to institute procedures which will end in the employment of measures of like nature in the constituent county societies or district branches"

It was voted to refer this to the Malpractice Insurance and Defense Board

Section 106, House Minutes—Report of Reference Committee on Report of Council, Part IX Report of Subcommittee on Cults

In approving the report, the Reference Committee "urges the Council to introduce the necessary recommended injunctive legislation in the 1949 legislative session"

It was voted that this be referred to the Committee on Legislation

Section 111, House Minutes—Report of Reference Committee on Report of Council, Part XII The Report of the Temporary State Commission on Coordination of State Activities

A summary of the Wicks Commission Report was referred to the Council "with the direction to take the necessary action for the best benefit of the public and the medical profession"

It was voted to refer this to the Legislative Committee with power

Section 112, House Minutes—Report of Reference Committee on Report of Council, Part IX Podiatry Legislation

The following resolution was referred to the Council for appropriate and necessary action

"WHEREAS, podiatry is a technical minor adjunct of orthopedics, and

"WHEREAS, many systemic diseases have manifestations in lesions of the lower extremity, and

"WHEREAS, the Institute of Podiatry is not a medical school, and

"WHEREAS, the licensed podiatrists have been active in attempting to pass legislation in this State to extend the limitations of their licensure, and

"WHEREAS, the treatment of disease constitutes the practice of medicine under the laws of this State and,

"WHEREAS, the passage of such legislation would be detrimental and hazardous to the public health and welfare, therefore, be it

"*Resolved*, that the Medical Society of the State of New York put itself on record as being opposed to such legislation, and be it further

"*Resolved*, that the Governor and members of both Senate and Assembly be sent copies of this resolution, and be it further

"*Resolved*, that the Legislative Committee and our Albany representative be instructed to govern themselves accordingly, and be it further

"*Resolved*, that the content of these resolutions be made known to the Board of Regents of the State of New York"

It was voted to refer this to the Legislative Committee with a request that they report at the next Council Meeting

Section 113, House Minutes—Report of Reference Committee on Report of Council, Part IX, Amendment of Hospital Lien Law to Include Physicians' and Surgeons' Bills

The House of Delegates passed the following

"*Resolved*, that the 1949 Session of the New York State Legislature be requested to amend Section 189 of the Lien Law to include the bills of physicians and surgeons for services rendered in the same cases as enumerated in said Section 189 of the Lien Law"

It was voted that this be referred to the Legislative Committee

Section 114, House Minutes—Report of Reference Committee on Report of Council, Part IX Legislative Committee Activities

After explanatory paragraphs and

"WHEREAS, it would seem to be within the province of some executive division of the Society to institute such changes as may be indicated to the end that the component county societies will become an active integral part of the legislative program,

it was

"*Resolved*, that this matter be referred to the Council for consideration and institution of such measures as will make our legislative program an outstanding success"

It was voted to refer this to the Legislative Committee for study and action

Section 115, House Minutes—Report of Reference Committee on Report of Council, Part IX Partnership and Group Practice

The Reference Committee recommendation was carried that the following resolution "be submitted to the Council for action before the 1949 legislative session"

[Continued on page 2194]

You have one outstanding drug

for the treatment of depression

In the depressed patient, 'Dexedrine' Sulfate can be depended upon to dispel the characteristic "chronic fatigue"; to induce a feeling of energy and well-being; and to restore optimism, mental alertness and capacity for work.

Dexedrine's anti-depressant effect is notable for its freedom from distracting elation, irritability and inward nervous tension. Its uniquely "smooth" action spares the patient the uncomfortable feeling of "drug stimulation".

[Continued from page 2192]

"WHEREAS, the New York State Legislature enacted Senate Introductory 740 Printing 2142 in the 1947 Legislature which is now a chapter of the laws of 1947 of the State of New York, and

"WHEREAS, said law amends the Education Law in relation to the practice of medicine by physicians as partners and permits the pooling of fees and monies for medical services by the members of the partnership or group and employes of such partnerships or groups, and

"WHEREAS, said bill does not specify or limit the number of partnerships or groups to which an individual physician may belong, and

"WHEREAS, under the present bill, a physician might be a member of more than one group and use this as a subterfuge for the division of fees, and also create a situation where said member of more than one partnership might be tempted to render services for less than the agreed fee among the group, and

"WHEREAS, said bill permits a division of the fees with an employe who does not necessarily have to be a physician under the terms of the bill, therefore, be it

"*Resolved*, that we request that legislation be introduced in the 1949 session of the New York State Legislature amending the recently enacted law concerning group practice or partnership, and incorporating therein provisions or amendments to correct the foregoing objections"

It was voted to refer this to the Legislation Committee

Section 116, House Minutes—Report of Reference Committee on Report of Council, Part IX X-ray as a Practice in Medicine

The House voted to accept in principle and refer to the Council for action the following proposed bill for introduction into the 1949 New York State Legislature

"X-ray diagnosis means that method of medical practice in which demonstration and examination of the normal and abnormal structures, parts, or function of the human body are made by use of x-rays, and any person who holds himself out to diagnose or able to make or makes any interpretation or explanation by word of mouth, written or otherwise, of the meaning of fluoroscopic or registered shadow or shadows of any part of the human body made by the use of x-rays, and also the use of x-rays or radium for the treatment of any human ailment, shall be deemed to be engaged in the practice of medicine within the meaning of this article, and Section 1262 as follows

The provision of this article shall be deemed to prohibit the practice of x-ray diagnosis, x-ray therapy, or radium therapy, as defined in subdivision 7A of Section 1250 of this chapter, by any person other than a person licensed as a physician, a dentist, an osteopath, or a podiatrist"

"Be it further

"*Resolved*, that the Medical Society of the State of New York actively work for the passage of this bill in the Legislature during the year of 1949"

It was voted to refer this to the Committee on Legislation

Section 117, House Minutes—Report of Reference Committee on Report of Council, Part IX Supplementary Report of Council, Economics

The following proposed amendment to the Education Law was referred to the Council for action

'Section 6501 Definition

'4 The practice of medicine is defined as follows A person practices medicine within the meaning of this article, except as hereinafter stated, who holds himself out as being able to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition, and who shall either offer or undertake, by any means or method, *including the use and interpretation of radiographs, fluoroscopic observations, prescription and administration of radiation therapy, examination of human tissues or fluids, physical therapy procedures, and anesthesiology*, to diagnose, treat, operate, or prescribe for any human pain, injury, deformity or physical condition" (Italicized phrases are new matter)

"Your Subcommittee recommends that the House of Delegates authorize the Council to request members of the 1949 New York State Legislature to amend the Education Law as above specified"

It was voted that the Council feels it unwise to change the definition of the Practice of Medicine as contained in the Medical Practice act

Section 119, House Minutes—Report of Reference Committee on Report of Council Part II Diversion of Federal Funds for Pediatric Undergraduate, Graduate, and Postgraduate Education

The House voted to have the following resolution "referred to the Council for their study"

"WHEREAS, the American Academy of Pediatrics has now concluded a complete two and one-half year survey of pediatric education in all of the approved medical schools and the pediatric departments of all hospitals and of all other child health services including the care rendered by private physicians, state by state and county by county throughout the United States,

"WHEREAS, this survey places the American Academy of Pediatrics in a unique position of knowing the facts related to the needs of child health services,

"WHEREAS, the Executive Board of the American Academy of Pediatrics has come to the conclusion that the first and most fruitful approach toward a national program for the improvement of child health must be predicated upon increasing and strengthening the teaching of pediatrics at the undergraduate, graduate, and postgraduate levels for general practitioners and pediatricians,

"WHEREAS, a program for strengthening pediatric education will increase teaching budgets of medical schools and pediatric departments of hospitals, which even now do not have adequate financial support,

"WHEREAS, the Executive Board of the American Academy of Pediatrics, after due deliberation as to the availability of possible private sources of revenue, has taken under consideration the use of Federal funds to assist these schools and hospitals in a program designed to further pediatric education,

"WHEREAS, to this proposal for Federal funds has been added the requisite that such funds be

allotted according to the judgment of nine representative pediatricians and without interference with the policies or internal affairs of the institutions concerned,

"WHEREAS, the Executive Board of the American Academy of Pediatrics proposes to submit to the Congress a constructive program for child welfare based upon the findings of its survey, having thus gathered together the pertinent facts pertaining to child care and pediatric education, therefore be it

"*Resolved*, that the House of Delegates of the Medical Society of the State of New York approve the recommendation of the Executive Board of the American Academy of Pediatrics that Federal grants, such as are now available in other fields of medicine, be provided for training in the medical care and health supervision of children,

"*Resolved*, further that this resolution be introduced at the meeting of the House of Delegates of the American Medical Association in June, 1948"

It was voted to refer this to the Committee on Economics

Section 130, House Minutes—Advisability of Holding Special Meeting of House in 1948

The House voted "a suggestion to the Board of Trustees and Council to consider" whether or not to hold a special meeting of the House of Delegates in 1948

It was voted that no action be taken at this time

Section 134, House Minutes—Report of Reference Committee on Report of Council, Part XI Scientific Medical Advertising

The Reference Committee Report was adopted recommending that "an advisory committee be formed, comprising members of the clinical group coupled with pharmacologists trained in the clinical and research approach, with the avowed purpose of assisting in the evaluation of products prior to their acceptance for advertising in the JOURNAL"

The Reference Committee also suggested the following policy be established

1 That Council-approved preparations be accepted without question for advertising in the JOURNAL.

2 That all other products submitted be passed upon by the recommended advisory committee

3 That the final responsibility of acceptance or rejection should rest entirely with the Publication Committee

4 That advertising other than that falling in the scientific field be not included in the purview of this report, but be left to the discretion of the Publication Committee

It was voted that the president be empowered to appoint an Advisory Committee to the Publication Committee for consideration of new advertising in the JOURNAL.

Section 135, House Minutes—Report of Reference Committee on Report of Council, Part XI Premature Publicity of Medical Matters by State Officers

The following resolution was adopted

"WHEREAS, it has been the policy of governmental agencies in the past to promote press releases on the expansion of services and the introduction of new programs which involve the physicians of the community when the cooperation of the local physicians is both desirable and necessary,

"WHEREAS, subsequent discussions for modification of the projected program to render it effective and efficient improperly places the physicians in the light of obstructing such expansion of services to the public, therefore be it

"*Resolved*, that the Medical Society of the State of New York go on record as advising the interested governmental agencies that the Medical Society of the State of New York is always ready to conduct preliminary discussions about such projects which involve medical service and the allied branches of activity of the government, before press releases are promoted on such matters"

It was voted that this be referred to the Public Relations Committee

Section 138, House Minutes—Report of Reference Committee on Report of Council, Part VIII Hospital and Medical Care for Veterans

The following was "accepted" in principle, but the final wording was left to the Council to determine

"WHEREAS, the Medical Society of the State of New York believes that veterans who have been injured or disabled in the service of their country are entitled to the highest type of medical and hospital care, and

"WHEREAS, Point Seven of the Ten Point National Health Program of the American Medical Association on 'Veterans' Need for Hospital and Medical Care' reads

> 'A program for national health should include the administration of medical care, including hospitalization, to *all* veterans, such medical care to be provided preferably by a physician of the veteran's choice, with payment by the Veterans Administration through a plan mutually agreed upon between the state medical association and the Veterans Administration'

and

"WHEREAS, no differentiation is made in the above-mentioned program between veterans suffering from illness or disabilities incurred in or aggravated by military services and those veterans suffering from illness or disabilities not incurred in or aggravated by military service, and

"WHEREAS, the present policy of the Veterans Administration is to furnish medical care and hospitalization to veterans whose illness and disabilities were not incurred in or aggravated by military services only when such veterans are not able to 'pay the necessary expense of hospital care' and when ' a bed is available in an existing facility', and

"WHEREAS, the Veterans Administration has neither the legal right nor the administrative machinery to investigate affidavits on financial ability of such nonservice-connected cases, ' to pay the necessary expense of hospital care', and

"WHEREAS, nearly two thirds of the beds in Veterans Administration hospitals are now filled with patients with nonservice-connected disabilities, and

"WHEREAS, the Veterans Administration now

has 126 hospitals at a cost of over one billion dollars, and

"WHEREAS, the Veterans Administration currently has over 5,000 beds closed because of inability to obtain personnel without lowering the standards of medical care, and

"WHEREAS the unlimited expansion of Veterans Administration hospitals will lead to an inferior grade of medical and hospital care for veterans and at the same time injure the quality of hospital service that is available for the entire population by draining professional and technical personnel away from hospitals which serve the public as a whole, be it

"*Resolved*, that the Medical Society of the State of New York, in view of the foregoing, instruct members of the House of Delegates of the American Medical Association to request at the next regular session of the House of Delegates of the American Medical Association that action be taken to amend Point Seven of the Ten Point National Health program of the American Medical Association on 'Veterans Need for Hospital and Medical Care' to read

'A program for national health should include the administration of medical care, including hospitalization, to all veterans currently entitled to such medical care and hospitalization under existing Federal statutes, such medical care to be provided preferably by a physician of the Veteran's choice with payment by the Veterans Administration through a plan mutually agreed upon between the state medical association and the Veterans Administration', and

"*Resolved*, that the House of Delegates of the American Medical Association be requested to go on record as favoring Congressional action to interpret the following requirements of admission of nonservice-connected cases to Veterans Administration Hospitals

1 The ability ' to pay the necessary expense of hospital care', and

2 ' if a bed is available in an existing facility', and

"*Resolved*, that the House of Delegates of the American Medical Association at their next meeting be requested to go on record as favoring a definite ceiling on the number of beds to be provided in Veterans Administration hospitals, and that such a ceiling be placed at 140,000 beds, the number already authorized by Congress"

It was voted to refer this to the delegates to the A.M A. and to Dr Winslow, chairman

Section 143, House Minutes—Report of Reference Committee on Report of Planning Committee for Medical Policies Redistricting District Branches

The House voted "that the House of Delegates of the Medical Society of the State of New York refer with power to act to the Council the matter of redistricting the county medical societies into district branches with the creation, if necessary, of a ninth district branch"

It was voted to refer this to the Planning Committee for Medical Policies

Section 144, House Minutes—Report of Reference Committee on Report of Planning Committee for Medical Policies State Legislation Qualifying Title "Dr"

The following amended resolution was referred to the Council for study and implementation

"WHEREAS, in the healing arts it has been traditional in America to associate the title 'Dr' with Doctors of Medicine, and

"WHEREAS, in the past decade others than licensed Doctors of Medicine have been misleading the public by the unqualified use of the title 'Dr' on signs and stationery, and

"WHEREAS, such common practice is deleterious to the health of the public, therefore be it

"*Resolved*, that it be made mandatory by State law for all licensed practitioners of medicine and the allied healing arts to append to their names the degree which is recognized by license together with the State license number, and be it further

"*Resolved*, that the House of Delegates of the New York State Medical Society direct the Legislative Committee to draft a bill fulfilling the intent of these resolutions and introduce it for enactment into law at the next session of the New York State Legislature"

It was voted to refer this to the Legislative Committee

Section 145, House Minutes—Report of Reference Committee on Report of Planning Committee for Medical Policies U S Participation in the World Health Organization

Referring to S J Res 98, H J Res 161, the House of Delegates

"*Resolved*, that the House Rules Committee be petitioned by the Medical Society of the State of New York to present this bill for a vote by the House of Representatives in order that the leadership of American Medicine and Public Health may have its rightful voice in dealing with international health problems"

It was voted that the Secretary be instructed to write to the House Rules Committee to that effect

Section 153, House Minutes—Report of Reference Committee on Report of Council, Part IV Public Health Activities B—Group Practice

The Reference Committee reported that there had been filed "a rather extensive, informative report concerning existing rules and regulations covering partnerships and groups in practice" It was recommended that this matter should be given detailed and serious study, and further recommended that it be referred to the Council for appropriate action"

It was voted to refer this to the Planning Committee

Section 154, House Minutes—Report of Reference Committee on Report of Council, Part IV Premarital Blood Tests

The following resolution was passed

"WHEREAS, under the present public health law thirty days are allowed in which applicants may apply for a license for marriage, and

"WHEREAS, after receiving a license for marriage sixty days are allowed for the applicant to exercise his right to use such license, and

"WHEREAS, this gives the applicant ninety days in which he or she may become infected, which in effect partially nullifies the benefits of this law, therefore be it

to the individual and private practice of medicine, and

"WHEREAS, such a plan would appear to place hospitals in the business of practicing medicine, and

"WHEREAS, such a procedure, if left uncontrolled and uncurbed, except in the matter of undergraduate teaching of medical students, might lead to unforeseen difficulties for the practice of medicine, therefore be it

"*Resolved*, that the Council be instructed to refer this matter to an appropriate, existent committee of the Council to study this problem and to use its efforts to prevent hospitals from practicing medicine and interfering with the private practice of medicine and to use all moral and, if necessary, legal methods for this purpose"

It was voted to refer this to the Economics Committee

Section 166, House Minutes—Report of Reference Committee on Report of Council, Part VI Insurance Forms

The following resolution was adopted

"WHEREAS, physicians are asked to make out many illness and mortality forms of insurance companies, and

"WHEREAS, the filling of such forms often requires considerable time, and

"WHEREAS, these forms are generally never alike, be it

"*Resolved*, that the Council appoint a committee to meet with a committee of the Association of Life Insurance Companies for the purpose of standardizing the illness and mortality forms and thereby make them more brief"

It was voted to refer this to the Economics Committee

Section 168, House Minutes—Report of Reference Committee on Miscellaneous Business A Blood Banks

The House approved the following resolution

"WHEREAS, the National Red Cross has undertaken the establishment of a nation-wide Blood Donor Service Program, the basic philosophy of which is to provide blood for all, and which provides in some areas not only for donor service but also for collecting, processing and distributing blood from a centralized bank, and

"WHEREAS, free service for all economic levels of the population is not compatible with established patterns of American life, and

"WHEREAS, a centralized blood bank service under the Red Cross may tend to destroy existing blood banks in the hospitals, and

"WHEREAS, all professional and technical phases of a blood bank program should be under the control and supervision of the physicians of the community and

"WHEREAS, a permissive program adapted to meet local needs has been approved in Westchester County in full cooperation with the Westchester Chapter of the American Red Cross, now therefore be it

"*Resolved*, that the New York State Medical Society urge County Societies to consider the establishment of a Red Cross Blood Donor Service Program similar to that proposed for Westchester which provides

"1 Red Cross Blood Donor Service,

"2 Free Red Cross blood for the medically indigent who are unable to provide replacement,

"3 The continuation of existing hospital blood banks and encouraging the establishment of banks in other hospitals,

"4 Implementation and supplementation of the existing blood bank services,

"5 All professional and technical control and supervision of the donor service program vested in a committee of physicians appointed by the county medical society,

"6 And general coordination of the program through a committee representing the Red Cross, the county hospital association and the county medical society"

It was voted to refer this to the Committee on Public Health and Education

The House voted "that it was in favor of the purposes of" the American Association of Blood Banks

Also, the House approved

1 The recommendation of the Reference Committee that a special committee on blood banks be appointed

2 It is suggested that the principles of the American Association of Blood Banks be approved and ultimately have blood banks of the State possibly become associated in this group

3 It recommended that the special committee use as an example "the good cooperative plan proposed and agreed upon by both the Red Cross and Westchester County Society and in the process of being established in Westchester County" In this the medical profession operated the blood banks and supervises them, and that the Red Cross cooperates in the obtaining of blood donors and transportation of donors and blood

It was voted that the president be empowered to appoint a subcommittee under Dr Mitchell's Committee on Public Health and Education

Section 173, House Minutes.—1949 Meeting of House of Delegates

The House recommended the acceptance of the invitation of the Medical Society of the County of Erie to hold the 1949 Annual Meeting of the Medical Society of the State of New York in Buffalo It also voted that this information be communicated to the Council in order that the time of the meeting may be set

It was voted that the date and place of meeting be left to the Convention Committee

Amebiasis Attack

Anayodin

Attacking ten percent of the nation's population, amebiasis is today recognized as a problem in differential diagnosis always to be considered in the presence of gastrointestinal symptoms.

EXPERIENCE IS THE BEST TEACHER...

Carlos Finlay (1833-1915)

proved it in public health

Carlos Finlay of Cuba, a bacteriologist, believed that yellow fever was transmitted by the stegomyia mosquito His original experiments did not provide definite proof of his theory However, he continued his search in co-operation with Walter Reed and the Yellow Fever Commission The work of the Commission finally proved that infected mosquitoes could transmit the fever The public health preventive measures derived from these experiments were so successful that the fever in Cuba was under control within a year

...ynolds Tobacco Company Winston-Salem N C.

Experience is the best teacher in cigarettes, too!

MILLIONS of smokers who have tried and compared many different brands of cigarettes have found that cool, mild, flavorful Camels suit them best.

Try Camels on your "T Zone"—T for Taste, T for Throat See how your taste enjoys the rich, full flavor of Camel s choice, properly aged, and expertly blended tobaccos. See if your throat doesn t welcome Camel s cool, cool mildness.

Yes! Try Camels and see for yourself why with thousands and thousands of smokers, Camels are the "choice of experience."

According to a Nationwide survey!

MORE DOCTORS SMOKE CAMELS

than any other cigarette

Three independent research organizations in a nationwide survey asked 113,597 doctors to name the cigarette they smoked. More doctors named Camel than any other brand.

SANDOZ

More than just palatable . . .

this protein therapy is virtually *tasteless*

When 100 or more grams of protein per day must be administered to a critically ill or convalescent patient taste and bulk are real problems.

Essenamine is an essentially tasteless protein concentrate. In virtually pure form adaptable to any type of diet Essenamine supplies large quantities of the *needed* amino acids. May be administered in milk broths fruit and vegetable juices meat loaf baked goods custards ice cream etc.

The required amount of Essenamine should be mixed with a small amount of cold water to form a smooth paste then add liquid or other ingredients gradually

ESSENAMINE®

high concentration of protein
minimum bulk
tasteless bland unflavored

Supplied in 7½ and 14 oz. jars.

IN CONVALESCENCE . . . SENESCENCE

The inactivity following surgery or disease and often encountered in the aged makes constipation a likely occurrence. Dehydration too, frequently is a significant contributing factor

When the 'smoothage of Metamucil is employed in the management of constipation normal evacuation is permitted without irritation or undue pressure on sutures and incisions. Thus straining is minimized

Metamucil promotes smooth normal evacuation by furnishing a non-irritating water retaining colloidal residue in the large bowel.

METAMUCIL® is the highly refined mucilloid of Plantago ovata (50%) a seed of the psyllium group combined with dextrose (50%) as a dispersing agent

safer,
more effective
sulfonamide therapy

In charting a safe course accurately, the modern navigator's sonar depthfinder surpasses the sounding line. In chemotherapy, the modern method of combined sulfonamide administration excels in safety and therapeutic efficiency

COMBISUL*— pioneer sulfonamide combination — virtually eliminates the hazard of renal irritation from large doses of single sulfonamides By permitting simultaneous administration of partial doses of the three most widely applicable sulfonamides — each independently soluble in the same medium — greater urinary solubility is achieved

COMBISUL

(COMBINED SULFONAMIDES)

is more rapidly and completely absorbed and produces higher total sulfonamide blood and urine levels than equivalent doses of any one of its components This affords higher clinical efficacy on a gram for gram basis.

COMBISUL Tablets, 0.5 Gm., provide 0 166 Gm. each of sulfadiazine sulfathiazole and sulfamerazine. COMBISUL Liquid is a palatable suspension containing 0 166 Gm. of each of the same sulfonamides per teaspoonful. Indications are the same as for the individual components of the mixture

COMBISUL TABLETS 0.5 Gm in bottles of 100 and 1000
COMBISUL LIQUID 0.5 Gm. per 4 cc. in bottles of 4 and 16 oz.

LEG ULCERS

the DAXALAN-DOME-PASTE BANDAGE TECHNIQUE

AS INTRODUCED BY DR. WILLIAM M. COOPER Director Department of Peripheral Vascular Diseases—New York Polyclinic Medical School and Hospital

This technique is based on a 3 point program—

1. Reduction of dermatitis with wet dressings of DOMEBORO TABS *(BUROW S SOLUTION)*
2. Combat local infection and stimulate healing with thick application of DAXALAN in the center of the ulcer and surrounding areas
3. Overcome venous insufficiency stasis and edema by wrapping DOME PASTE BANDAGE around the entire leg to supply compression

DOCTOR! You may now prescribe SOOTHING Modernized Simplified Fresh and Stable BUROW'S SOLUTION 1 20 in four forms DOMEBORO Tablets Packets Powder Ointment

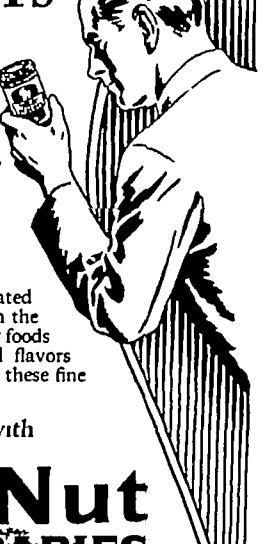
DOMEBORO —Tablets Powder Packets Ointment



Daxalan is our trademark for a rigidly standardized whole crude tar paste (low in naphthalene content) uniform in color, free of coal tar specks and aged for six months

Dome Paste bandage is a flesh colored 4" x 10 yd gauze bandage impregnated with a modified Unna s Formula consisting of zinc oxide glycerine gelatine and calamine This Unna s Boot comes to you in a soft condition and is ready for instant use

This is the type of advertising Beech-Nut is running in newspapers and magazines to reach mothers

When doctors look at a baby food

they ask these questions

1—Does it have high nutritional value
2—Does the flavor appeal to babies
3—Does it have scientific approval

From the beginning Beech Nut has cooperated closely with doctors and food specialists in the selection and scientific preparation of baby foods —the result is food values and natural flavors are retained in high degree. Babies like these fine foods—and they are good for babies

Meal time is happy time with

WATER-MISCIBLE

ALL THE ADVANTAGES OF IODINE IN A NON-IRRITATING BASE

Danger of surface infection can be combated with Vodine Brand Iodine Solusalve without smarting, stinging or staining Iodine—one of the most potent germicidal agents—in a special bland, water miscible base, Vodine Brand Iodine Solusalve is effective on skin surfaces and on open wounds

Vodine—2% iodine in Solusalve—is not injurious to even the most delicate skin It does not smart or sting and prevents surgical dressings from sticking to wounds

To prevent surface infection, without causing painful smarting or stinging, use and prescribe Vodine Brand Iodine Solusalve

*Solusalve serves as a descriptive name for a special polyethylene glycol cellulose ointment base.

middle age — a positive outlook on life

Relief of the physical and mental distress so often associated with declining ovarian function usually restores to the menopausal patient a positive outlook on life

Prompt alleviation of disturbing climacteric symptoms may generally be expected with **Premarin,** *and in the majority of cases symptomatic improvement is followed by a gratifying sense of well being This is the plus afforded by this naturally occurring orally active estrogen*

Three potencies of **Premarin** *enable the physician to adapt estrogenic therapy to the particular needs of the patient Tablets of 2.5 mg 1.25 mg and 0.625 mg are available; also liquid 0.625 mg in each 4 cc (1 teaspoonful)*

*While sodium estrone sulfate is the principal estrogen in "***Premarin***" other equine estrogens estradiol equilin equilenin hippulin are probably also present in varying amounts as water soluble conjugates*

"PREMARIN"®

MICRO PULVERIZED...

PROTINAL POWDER

A NEW, SUPERIOR INTACT PROTEIN-CARBOHYDRATE

why do patients cooperate?

BECAUSE Protinal Powder is so delicious, patients actually look forward to taking it They prefer its delicately sweetened flavor and appetizing consistency, and continue to enjoy taking adequate amounts to maintain a normal nitrogen balance

Furthermore Protinal Powder mixes far more readily with water milk or other foods than do ordinary granule preparations and is digested rapidly and completely

Protinal Powder supplies all of the protein components necessary to maintain life and growth An invaluable therapeutic agent to insure a normal rate of tissue growth and repair in infectious diseases convalescence pregnancy lactation, anemia hemorrhages, surgery; in pediatrics and geriatrics.

TASTE SAMPLES AVAILABLE UPON REQUEST

Average Dose 2 tablespoonfuls 3 or 4 times daily in water milk or other food. Protinal Powder is available in 8 oz. 1 lb. and 5 lb. bottles (chocolate or vanillin flavored)

NATIONAL

PHARMACEUTICALS BIOLOGICALS BIOCHEMICALS FOR THE MEDICAL PROFESSION

Protein Nutrition *in later years*

IN later years energy requirements are about 20% lower than in the prime of life Because of this, a reduced food intake has definite benefit All available evidence indicates that longevity is associated with body weight under the average of the population

From a nutritional standpoint the optimum feeding regime for the aged should be a *calorically restricted* diet, which maintains *proteins at a good level* A high-protein, low calorie diet helps prevent fat from becoming a burden to the vital functions of the aging body, and tends to maintain cell machinery in a good state of repair *

Swift's Strained Meats . . when age presents problems in protein supplementation

When age, disease or any injurious stimuli cause problems in protein supplementation, many physicians now prescribe Swift's Strained Meats An excellent, palatable source of complete, high-quality proteins, Swift's Strained Meats provide *all* the essential amino acids *simultaneously*—for optimum protein synthesis

Swift's Strained Meats supply goodly amounts of natural B vitamins, iron and trace minerals and are low in fat content

Originally developed for infant feeding, these meats are strained fine—may easily be used in tube-feeding, or for oral feeding in soft diets Since salt content of the meats is at a minimum for infants, additional salting is suggested for adult usage Convenient—ready to heat and serve Six kinds of Swift's Strained Meats beef, lamb, pork, veal, liver and heart, provide variety and tempting meat flavors that help combat anorexia 3½ ounces per tin

SWIFT & COMPANY CHICAGO 9, ILLINOIS

ACCEPTED COUNCIL ON FOODS AND NUTRITION

All nutritional statements made in this advertisement are accepted by the American Medical Association's Council on Foods and Nutrition

ALSO SWIFT'S DICED MEATS

—for high-protein diets requiring foods in a form less fine than strained these tender juicy pieces of meat are highly desirable.

When more than one form of anemia is present or suspected

LIAFON

SQUIBB

desiccated liver
ferrous sulfate
ascorbic acid
folic acid

Cartwright[1] points out that "the absence of certain dietary essentials retards erythrocyte formation and the addition of these essentials to diet accelerates it." Liafon supplies four erythropoietic essentials in one capsule

WHOLE LIVER (desiccated) — with nothing but the water removed — to supply the secondary antianemia fractions which have been proved to be essential experimentally and clinically

FERROUS SULFATE (exsiccated) — to supply the most easily tolerated, best absorbed and most completely utilized essential for specific therapy of iron deficiency anemias.

ASCORBIC ACID — which is intimately associated with red blood cell formation — which aids in the absorption and utilization of iron — and which is often a prerequisite in anemias complicated with C avituminosis.

FOLIC ACID — for bone marrow stimulation and to complete the development of red blood cells — as specific therapy for macrocytic anemias of malnutrition pregnancy pellagra and sprue.

1 Cartwright G E Blood 2 111 (March) 1947

EACH LIAFON CAPSULE CONTAINS		DOSAGE EQUIVALENTS 3 capsules daily	6 capsules daily
Desiccated Liver (Approx. equivalent to 2 Gm. whole fresh liver)	0.5 Gm	6 Gm fresh liver	12 Gm fresh liver
Ferrous Sulfate Exsiccated (Approx. equivalent to 2.85 gr ferrous sulfate or 18 mg. elemental iron)	2.0 gr	8 5 gr ferrous sulfate	17 gr ferrous sulfate
Ascorbic Acid	50 0 mg.	150 mg.	300 mg.
Folic Acid	1 67 mg	5 mg	10 mg

Liafon is supplied in bottles of 100 and 1 000

WHEN YOU NEED A GOOD SUPPORT FOR REDUCIBLE HERNIA—may we suggest the advantages of "custom-made" Protection, designed to meet the described needs of each particular case? Physicians, who know from experience, can tell you that Rice "custom-made" Supports for reducible HERNIA are truly different and that our methods are dependable. With dozens of different styles, shapes and types of pads at our disposal and with a full realization of our responsibility to those who put their faith in us—we respectfully offer our services for your approval Descriptive literature and measurement charts on request

IMMUNITIES CONCURRENTLY CONFERRED

Combining three antigens into one preparation, Parke Davis DIPHTHERIA TETANUS-PERTUSSIS (Combined) stimulates simultaneously the production of antibodies protective against diphtheria tetanus and whooping cough. Use of this effective and conveniently administered triple antigen greatly simplifies the immunization schedule—a factor of importance to physician, patient, and parents alike.

DIPHTHERIA TETANUS PERTUSSIS (Combined) is supplied in 3 cc vials (one immunization course) and 15 cc vials (five immunization courses) Each cubic centimeter contains 30 000 million phase I *Hemophilus pertussis* organisms and one immunizing dose each of diphtheria and tetanus toxoids An immunizing course consists of three 1-cc. doses given subcutaneously at three or four week intervals

MEDICAMENTA VERA

CAMP

ANATOMICAL SUPPORTS for NEPHROPTOSIS

Together with treatment for any existing infection of the urinary tract, Camp Supports have proven valuable adjuncts in the relief of symptoms in many cases

Camp trained fitters have been instructed to consult the physician as to the position required for the fitting, if reclining or partial Trendelenburg In the event that the physician desires the use of a pad, the fitter has been instructed to obtain information as to the type of pad to be used and to ask the doctor to mark on the garment or blue pencil upon the patient the exact location of the pad

Advantages of Camp Supports in Conditions of Nephroptosis:

1. The "lifting" power of Camp Supports is from below upward and backward
2. Camp Supports are an aid in improving the faulty posture that sometimes accompanies renal mobility
3. Camp Supports are easily and quickly adjusted
4. Camp Supports stay down on the body by reason of the foundation laid about the pelvis.
5. Camp Supports are comfortable
6. Camp Supports are economically priced

Camp fitters ask patients to return to their physicians for approval of the fitting

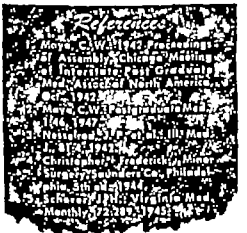
Phospho-Soda
(FLEET)*

Prominent clinicians are increasingly reporting[1,2,3,4,5] the value of sodium phosphates for controlled catharsis—available in scientific formulation in Phospho-Soda (Fleet)*, which has enjoyed such wide acceptance by the medical profession for so many years

In fulfillment of modern authoritative requirements, this dependable saline laxative provides an ease of administration and a gently efficient action that have made it a prescription favorite for *many* physicians *whenever* thorough safe elimination is desired



Phospho-Soda (Fleet)* is a precise combination of two official phosphates of soda in uniform, stable and palatable form It is advertised exclusively to the medical and dental professions; supplied in bottles of 2½, 6 and 16 fluid ounces, at all pharmacies.

Professional Samples Available on Request

Phospho-Soda (Fleet) is a solution containing in each 100 cc. sodium bi-phosphate 4.8 Gm. and sodium phosphate 18 Gm.*

. . . through effective, safe Urogenital Analgesia

Ambulant patients are promptly relieved of distressing urinary symptoms in a large percentage of cases through the simple procedure of administering Pyridium in a dosage of 2 tablets t i d

Following oral administration Pyridium produces a definite analgesic effect on the urogenital mucosa This palliative action contributes to the prompt and effective relief that is so gratifying to patients suffering from disturbing symptoms such as painful, urgent, and frequent urination nocturia, and tenesmus

Pyridium is virtually nontoxic in therapeutic dosage It may be employed safely in recommended dosage throughout the course of treatment of most cases of uncomplicated urogenital infections

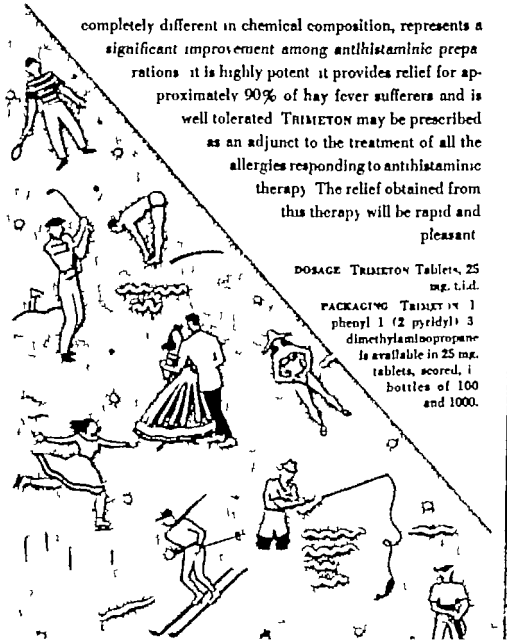
a pleasant relief from Hay Fever

It is one thing to provide relief from hay fever it is another to provide relief without inducing unpleasant reactions. TRIMETON an antihistaminic of great potency and efficacy exhibits an unusually low incidence of side actions. For example in an analysis of 726 cases where TRIMETON was employed only two discontinued the drug because of drowsiness



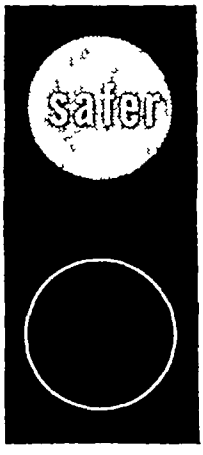
Trimeton

(*brand of prophenpyridamine*)

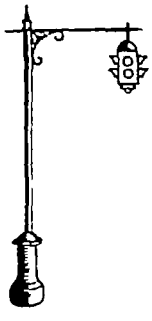
completely different in chemical composition, represents a *significant improvement among antihistaminic preparations* it is highly potent it provides relief for approximately 90% of hay fever sufferers and is well tolerated TRIMETON may be prescribed as an adjunct to the treatment of all the allergies responding to antihistaminic therapy The relief obtained from this therapy will be rapid and pleasant

DOSAGE TRIMETON Tablets, 25 mg. t.i.d.

PACKAGING TRIMETON 1 phenyl 1 (2 pyridyl) 3 dimethylaminopropane is available in 25 mg. tablets, scored, in bottles of 100 and 1000.



NOTICE THAT IT RELIEVES



TRI SULFANYL permits greater bacteriostatic activity with a minimum potential of crystalluria It is formulated on the new knowledge that "a saturated . solution of a sulfonamide could still be fully saturated with a second and third sulfonamide of different molecular structure " By using "combinations of partial dosages of 2 or more therapeutically equivalent sulfonamides", the danger of precipitation in the urinary tract is sharply decreased While two are appreciably safer than one, a mixture of three sulfonamide compounds is even "significantly less toxic "

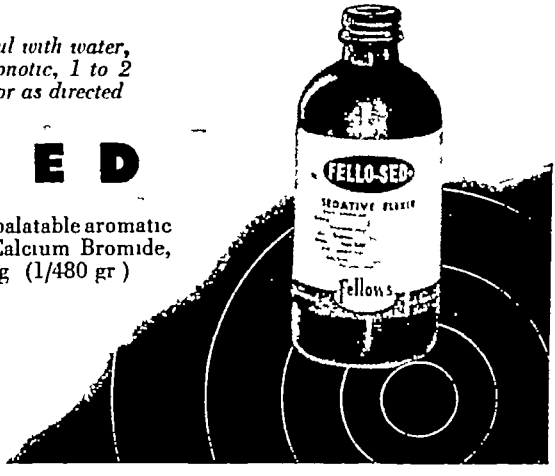
Chloral hydrate, used in medicine since 1869, is, even today, "the standard hypnotic of its class"[1]

Goodman and Gilman observe that it "is unfortunately neglected today," and that the present widespread use of the barbiturates has " caused the physician to lose sight of the fact that chloral hydrate is still one of the cheapest and most effective hypnotics"[2]

In FELLO-SED, supplementation with calcium bromide and atropine sulfate largely overcomes unwanted side-actions, enhances the sedative effect and provides valuable antispasmodic activity It is presented in palatable liquid form



[1]N.N.R., 1947 p 398

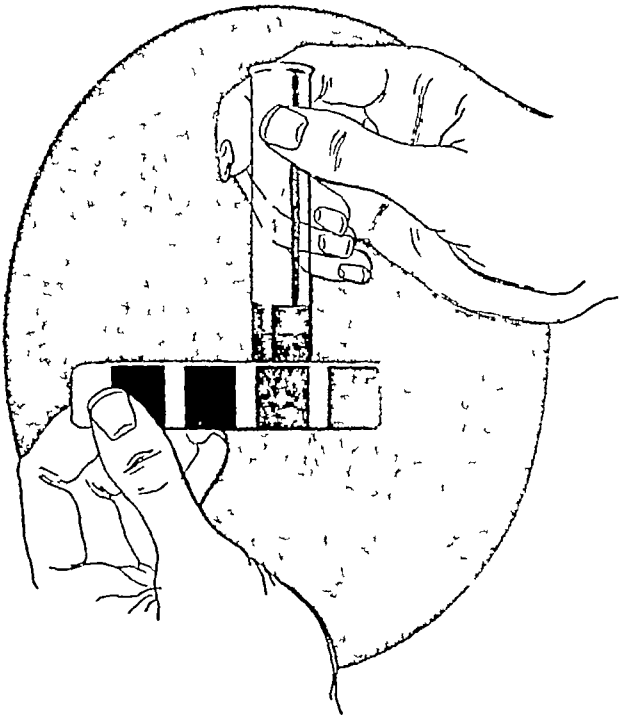
a natural preference

A revealing test[1] recently was conducted on a group of cardiac patients in congestive failure, treated with intramuscular injections of different mercurial diuretics, the identities of which were unknown at the time to both patients and observers. The results showed that the majority clearly evinced a decided—and natural—preference for a diuretic agent that caused the least pain and discomfort—

MERCUHYDRIN®

Similarly, Gold *et al*[2] prefer MERCUHYDRIN in their routine treatment of the failing heart because "it is less irritant to the muscle and is less apt to produce pain"

MERCUHYDRIN is also preferred by the treating physician because of its dependability It is well tolerated systemically,[3,4] excellent water and salt diuresis is obtained,[1,4-6] and the diuretic response by intramuscular injection is the same as by intravenous injection.[1,4] With a systematic schedule of early and frequent administration producing controlled diuresis MERCUHYDRIN aids greatly in prolonging the life, decreasing the invalidism and adding to the comfort of the cardiac patient. Symptoms of failure such as peripheral edema, paroxysmal dyspnea or acute pulmonary edema, are prevented or minimized, and the distressing consequences of intermittent massive diuresis are obviated.



DOSAGE: MERCUHYDRIN 1 cc. or 2 cc. intramuscularly or intravenously injected daily or as indicated until a weight plateau [illegible]. But apparently the interval between even injections is prolonged to determine the one [illegible] permitted [illegible] between maintenance injections.

PACKAGING: MERCUHYDRIN (mercaptide sodium solution) is available in 1 cc. and 2 cc. ampuls.

TO RESTORE THE BALANCE

Few therapeutic procedures can be used with such precision and with such assurance of benefit as the modern treatment of diabetes mellitus Not only can the degree of defect in the metabolic capacity of the diabetic be readily determined, but it is easy to increase the patient's capacity if desirable If his own supply of insulin is insufficient to support the normal metabolic load, it can be made adequate by supplementing with Insulin administered hypodermically

For prompt effect—

Iletin (Insulin, Lilly), 40 and 80 units per cc

For sustained effect—

Protamine, Zinc & Iletin (Insulin, Lilly), 40 and 80 units per cc

Intermediate effects may be obtained by suitable admixtures of Insulin and Protamine Zinc Insulin

Resist Beginnings

Precisely as international relations reached a new low and the prospect for enduring peace appeared to be dwindling, Dr John J Masterson, president-elect of the Medical Society of the State of New York, spoke at Schoharie and Saratoga Springs before the Third and Fourth District Branch meetings of the Society on the topic "Resist Beginnings"

Using John Bigelow's essay on this subject as his point of departure, Dr Masterson said

> It is not enough that we, the medical profession, be aware of the disaster that is at the bottom of the cliff down which we are sliding The people must know it, too, for in this country the voice of the people can still be heard And the people are not going to take our word for it. Enemies can say that we are seeking our own advantage. We must summon witnesses who have no stake in the outcome, whose opinions are more likely to be considered objective

While the officials of the U S Government were vainly striving for understanding in Europe with the advocates of collectivism and world revolution so that peace and prosperity might be restored to the world, advocates of collective medicine for this nation in the form of National Health Insurance are active. Principally this action emanates from the Federal Security Administration

Said Dr Masterson, advocating that the medical profession resist beginnings,

> In agitation for compulsory sickness insurance we are in this country again confronted with the danger of collectivism, which is another word for socialism. Just before Labor Day, President Truman advocated what he called "national health insurance." I do not need to tell you how damaging such a measure would be to the health of the people. What is necessary to emphasize is the need for continuous and uninterrupted opposition to this kind of thinking, which is intellectually dishonest. It is dishonest because it promises that the people are going to get something which in reality is never going to be delivered. It is the first step toward authoritarian government in which the citizen becomes a slave of

the state Even if the danger of the passage of such a law is not great, *the need to combat this type of thinking remains of first importance,** for the more prevalent it becomes, the greater the risk that step by step we shall slip gradually into a national state of mind more and more receptive to ideas which will ultimately mean the abdication of the citizen from control of his own private affairs

The spectacle of the Western nations struggling with the advocates of collectivism, the accumulating experience of English physicians with the socialist government in Great Britain, makes it harder and harder to see what possible good could accrue to the American people by the adoption of a system of governmental control of medical institutions and services which is un-American, unsuitable, and unworkable

Resist beginnings, let there be no appeasement here of the advocates of national health insurance

* Italics ours Ed

Fatal Accidental Poisoning

Says the *Statistical Bulletin* in discussing barbiturates as a leading cause of fatal accidental poisoning

Too many people who keep substances containing poison around the house are ignorant of their potential dangers As a consequence of the accidental misuse of ingestion of drugs and poisonous substances, about 1,500 persons, more than a quarter of them children under five, die in the United States each year This figure excludes deaths due to gas or food poisoning

Substantial long-term gains have been made against deaths from accidental poisoning Over the period 1933 to 1946, the death rate has averaged about one per 100,000 population annually, or about one-third less than in the preceding decade

Fewer accidental deaths have been recorded in recent years from virtually every type of poison-containing compound with the notable exception of the barbiturates, which now are far and away the leading cause of fatal accidental poisonings In 1946 barbituric acid and its derivatives accounted for more than a quarter of all fatal accidental poisonings in the United States, in the early 1930's their share was only about $1/18$ of the total [1]

It would thus appear that in only sixteen years barbituric acid and derivatives have accounted for from $1/18$ to more than $1/4$ of the total of accidental poisonings Furthermore,

In striking contrast to wood and denatured alcohol, barbituric acid derivatives caused the deaths of a larger number of women than of men policyholders—38 and 28, respectively The female deaths from this cause accounted for 40 per cent of all female deaths from poisoning Other studies show a much higher ratio of female to male deaths from barbiturates While these deaths occur mainly among adults, there were five deaths among children two years old or younger in the present investigation

Notwithstanding the long term gains in reduction of accidental poisonings and the improvement in specific categories, the barbiturates continue to be increasingly fatal, apparently Unquestionably, the legitimate use of barbiturates has been on the increase during the period 1933 to 1946, but the mounting fatalities from their *accidental* ingestion suggests that unconsumed quantities of the drug in amounts capable of producing death are accessible to the persons who are *accidentally* killed, especially to women

After all the warnings that have been given and the tragic incidents reported in the press, it is hard to understand why anyone would store disinfectants, insecticides, and similar materials near food, food containers, or medicines But this dangerous practice and others like it persist The marked rise in deaths from the barbiturates is especially disturbing Greater control by the health authorities over the sale of these sedatives may bring about a reduction in mortality from them

One understands that disinfectants, insecticides, lye, and household ammonia, in quantities dangerous to life, might be found in any household, but why barbiturates? Certainly the matter is one in which the medical profession should be interested, and for which it has a certain responsibility

More rigorous control of the sale of these

[1] Met. Life Ins. Co (Aug.) 1948, p. 7

sedatives is certainly indicated and should be put into effect without loss of time. Caution should also be exercised by physicians prescribing the drug to inform their patients of the possible dangers of careless placement of the medicine and the toxic character of the drug in excess of legitimate amounts

Current Editorial Comment

What Price the Mere Prolongation of Life? Recently, this JOURNAL published an editorial under the title "The Meanest Man in the World "[1] The magazine *Time* subsequently quoted it, which was subtly flattering But when a physician colleague took the trouble to write us a day or so ago about it, the experience was indeed heartening

Let us hasten to say that our colleague read the editorial in this JOURNAL, well, at any rate he alleges that he did He said in his communication that he had thought of the editorial many times and especially recently We quote in part, from his letter

> Three times this week I have been assailed by articles extolling the mere prolongation of the life expectancy of the average American citizen One article was in the monthly *Bulletin* of the New York City Department of Health The second was in *New York Medicine* The third was in a recent monthly magazine issued by a reputable drug firm. These might have passed unnoticed into my files were it not for your editorial and had not my wife insisted on visiting the replica of Mr Blanding's "Dream House," now open for inspection on the southeast corner of Fifth Avenue and Forty eighth Street, New York City Visitors pay what they feel they can afford for an inside view, not only of the house, but of a garage with two new cars in it Their donations go to the New York Heart Association and in return they are given blanks upon which they may supply the last line of a jingle extolling the wondrous life that will be ours when the Damoclean sword of heart disease has been removed from over the head of the human race
>
> My wife is no more avaricious than most women but she wants that house and the two cars that the successful completer of that verse will win. Accordingly my every waking hour which should have been devoted to amassing strength while in the relaxing atmosphere of the home has been dissipated in the invention of lines which exhort us to live longer by the discovery and the eradication of the causes of heart disease Not only must they exhort effectively, but they have to scan
>
> I might have been able to bear up under all this without boiling over, had I not met an aging contemporary who had recently survived a serious illness. When I asked him how he felt he said he felt fine—so fine, indeed, that his only worry was that he did not see how he was going to be able to afford to live as long as he apparently was going to do His ancestry was one of almost incredible longevity He felt he had done his duty to his country by having grandsired ten grandchildren But he did not relish the idea, he said, of living to the age when he might be a burden not only upon them, but upon generations yet unborn.
>
> The gentleman had something there What is the virtue of this indiscriminate prolongation of life? What is the virtue of life, simply as such? I do not perceive it. Does not Shakespeare remark of the ages of man
>
> Last scene of all,
> That ends this strange eventful history,
> Is second childishness and mere oblivion,
> Sans teeth, sans eyes, sans taste sans everything?

Our correspondent presents something for superconscientious geriatrists to think about Recently, employers have been chary of hiring old people, the young have been resentful of old people filling jobs which the younger folks want, and retirement to the bosom of O.A.A. leaves much to be desired We repeat that the geriatrists have a real job on their hands

Use and Abuse A correspondent writes us concerning the tearing down of a hospital building erected thirty-six years ago, and, of course, the erection of a new one He admitted that the building was not strictly up to date For instance, there was no system for emptying bed pans, the operating room was not air conditioned, the air of the operating room was not sterilized

Great and enduring monuments, buildings of brick and stone are not essential for the best care of the sick As we have often emphasized, it is not the building, but rather the people who are in it that make

[1] M y 15 1948, p. 1133

for successful medicine and surgery, or for that matter any kind of treatment of the sick

We read recently in the New York *Times* a headline "U S Backing Seen for Hospital Plan"[1] "Dr Bourke says State will get $6,000,000 July 1st for Start of Big Building Program"[2]

Such headlines, we are sure, make the public pulse beat faster, because the public pulse is a generous, warmhearted pulse, a pulse to admire

We quote again from the New York *Times*

> Dr Frederick MacCurdy, commissioner of mental hygiene for New York State, said yesterday, "If we got $20,000,000 more tomorrow we wouldn't know what to do with it because we can't get the trained personnel!"[3]

The column from which we quote is headed "Vast Need is Seen for Psychiatrists" Mere money will not alone produce competent professional personnel

Again we quote from an editorial in the New York *Times* which may explain one of the reasons why the V A hospitals are crowded

> Today, the VA operates a total of 103,189 beds, and has 5,649 beds closed because of inability to obtain personnel Their patient census is 95,652 in their own hospitals, and 13,849 in Army, Navy, civilian, and contract hospitals Of the 109,601 patients (as of January 15, 1948), however, 66 per cent are *nonservice-connected*, that is, the disabilities for which they are hospitalized have no relationship to their military service
>
> There are 18,026 awaiting admission to VA hospitals, of which only 88 are definitely service-connected The hospitalization policy in VA hospitals is that veterans with service-connected disabilities shall have admission priority, but that veterans with nonservice disabilities may be admitted, if, *by their own statement*, they are unable to pay for hospital care, and "if a bed is available in an existing facility"[4 5]

In other words, if they will sign the pauper's oath But the pauper's oath is so well concealed in small type in the mass of verbiage on the admission application that the honest veteran may well have no idea of what he is signing

From the New York *Times* we quote again

> (in) a long range coordinated hospital plan to cost $750,000,000 and provide 54,000 additional beds, Federal, State, and Local funds would be used and local facilities expanded [6]

This, at a time when our magnificent voluntary hospitals are facing bankruptcy When the shortage of nurses is acute When there are 4,000 applicants for 110 vacancies in the first-year class of the College of Physicians and Surgeons of Columbia University All of which does not make one sanguine as to the early filling up of shortages

Are there political implications in this state of mind? Treat veterans and their families for nonservice-connected disabilities which the law was never designed to cover Pauperize some of our population by permitting them to sign documents of the contents of which they are ignorant Of course no one should ever sign anything of which he has not read and understood every word, but apparently some people occasionally do

Give the public the impression that there is a grave shortage of hospital beds There is, but largely because voluntary hospitals have not the funds to maintain the beds they have, also because they cannot pay their nurses a decent living wage For the same reason, there is a shortage of orderlies, and no system has been set up for the training of men which would set them on the same respected level now occupied by the trained nurse

Pamperize and pauperize

When shall we learn to make the best of what we have? When, instead of tearing down existing institutions, when building costs are at their highest, shall we learn to make the best of them? When shall we learn not to give the public the impression that anyone remotely connected with a veteran—as who is not—is entitled to "free" hospital care and surgical services? When shall we learn to train more male and female attendants for the sick? When shall we expand our facilities to train more doctors who just want to look after sick people? Please notice that we say "shall" and not "will" The verb betrays a certain amount of confidence in our fellow man When shall we cease to pamperize and pauperize?

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

The Caloric Nutrition of Adults*

The present concept of optimum nutrition calls for liberal intakes of various nutrients—amounts markedly in excess of experimentally determined minimum needs In the case of calories, however, a different situation exists A sufficient calorie intake is of primary importance because specific nutrients cannot effectively function unless there is an adequate fuel supply for body processes Calorie intakes in marked excess of actual needs are undesirable, particularly in the adult Thus, the problem of optimum calorie nutrition is to avoid excess, as well as to provide enough

Postwar European observations have made us especially conscious of the dire effects of caloric undernutrition In this country, however, apart from certain special cases resulting from illness, poverty and ill advised dieting, the primary calorie problem in the adult is one of overconsumption rather than the opposite.

For a long time physicians have recognized, from their own observations and from the statistics of life insurance companies, that marked overweight favors the development of many degenerative diseases and is of major concern in the medical management of these diseases [1] Recently, controlled research has served to strengthen this point of view and magnify its importance.

As an example of animal experimentation, McCay and coworkers have shown in the case of rats that those which are restricted in calorie intake after middle life thereafter live longer than those allowed ad libitum intakes [2] The recent report by Wilens provides an excellent example of convincing findings in regard to men.[3,4] On the basis of a detailed study covering 1,250 autopsies at Bellevue Hospital, the relationship of body condition and fat deposits to the incidence and severity of atherosclerosis of the aorta and main branches of the coronary arteries was clearly demonstrated

In our modern life the caloric needs of the adult have tended to become less because of shorter working hours, increased mechanization, and the automobile, despite the fact that many people use their leisure time for increased activity in sports, gardening, and otherwise While many middle-aged persons appear to be as active as they were at thirty, actually they tend to conserve energy by avoiding unnecessary movements both in their occupational and general activities Further, their basal metabolism is decreased somewhat from its former level Thus, with advancing age, weight increase tends to be inevitable unless a conscious effort is made to consume less than formerly

It is impossible to set up specific figures defining caloric intakes for the individual which will provide adequate nutrition without overconsumption, because of the many variables involved, such as activity, body size, age, environment, individual differences in efficiency of caloric conversion, and others Further, activity categories such as "sedentary" "moderately active" and "very active" cannot be specifically differentiated, and they tend to grade into each other Thus, the calorie intakes recommended by the Food and Nutrition Board which have recently been revised downward are recognized to be useful only as general guides and subject to a large factor of variability in the case of the individual

*This discussion does not consider pregnancy and lactation.

It is agreed that weight maintenance is the most useful indicator of caloric needs Thus, the proper calorie intake is the one which over an extended period will maintain the body weight at the proper level, according to height, age, sex and body weight This definition recognizes that the desirable weight can differ according to body build as well as weight It provides for the needed adjustments in accordance with activity

The important question which is immediately asked, however, is what is the proper weight and how does one arrive at it for a given individual It must be agreed that precise information on this point is not available Modern students of the subject, however, feel that the data published by the Metropolitan Life Insurance Company under the heading of "ideal" weights are useful guides These tables are reproduced here for selected heights to guide physicians in their day-to-day determinations of the caloric needs of patients falling into the categories of "small frame," "medium frame," and "large frame" In each case the proper weight is expressed as a range of approximately 10 per cent It would seem unrealistic to attempt to specify an exact figure Presumably fluctuations within ranges given are ordinarily of little or no significance

SCIENTIFIC EXHIBITS
1949
ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to the Chairman of the Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss
505 State Tower Building
Syracuse 2, New York

The Annual Meeting will be held May 2 to 6, 1949, at the Hotel Statler in Buffalo

No applications can be considered after January 1, 1949

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

THE DIAGNOSIS AND MANAGEMENT OF THE POSTCHOLECYSTECTOMY SYNDROME

J Russell Twiss M.D and R Franklin Carter M D New York City

(From the New York Post-Graduate Hospital)

IN DISCUSSING the diagnosis and management of the postcholecystectomy syndrome we have made an effort to limit this term to those patients having postoperative symptoms referable to the biliary tract. This qualification is necessary because a review of the literature indicates that every patient having symptoms after operation is put in this group regardless of the source of the symptoms Our principal objectives have been to develop diagnostic routines which would indicate the source and nature of disorders of the biliary tract, both before and after operation The use of comprehensive methods of diagnosis should lower the incidence of the postcholecystectomy syndrome by aiding the proper selection of patients for operation and also should improve the results of treatment in those patients having symptoms after operation.

This investigation includes 295 patients who have had cholecystectomy A group of 121 calculus cases having no symptoms postoperatively was first studied to determine whether the initial diagnostic studies or operative findings revealed any significant differences between them and patients having postoperative symptoms. A group of 35 noncalculus patients having had cholecystectomy was then studied for the purpose of finding any significant diagnostic or operative findings which might explain the persistence of symptoms in the 20 patients so afflicted Finally a group of 159 calculus patients having post cholecystectomy symptoms is presented

In this group, detailed studies were made of the preoperative work up (when available) the operative findings and the diagnostic work-up made at the time the patient reported with symptoms A study was then made of the type of medical or surgical therapy used with an evaluation of the benefit of such treatment based upon careful, personal follow up visits. Patients without symptoms have been followed for a period of at least one year This work has been done in the combined medical and surgical Biliary Tract Clinic of the New York Post-Graduate Hospital

Studies of the postcholecystectomy syndrome have been reported by many investigators [1–13] Colp states what is apparently a consensus of opinion that the most common cause of the recurrent symptoms is dyskinesia of the sphincter mechanism with which there may be associated calculi retained cystic duct, common duct stricture, cholangitis, or pancreatitis [1] MacDonald agrees that biliary dyskinesia is prevalent but he believes that inadequate preoperative work-ups and errors in precholecystectomy diagnoses are largely responsible for poor results in surgery [3] All stress the importance of a careful and complete diagnostic work-up, especially before cholecystectomy is performed Most investigators, furthermore, recommend surgery for the postcholecystectomy syndrome only after all possible causes outside the biliary tract have been ruled out, and medical treatment has proved unsuccessful [1 9 14 15] Lahey, however, stresses the danger of delaying operation in the presence of organic obstruction of the biliary tract.[14]

Physiologic disturbances in patients having symptoms both before and after cholecystectomy are primarily concerned with functional disorders of the sphincter of Oddi and abnormal pressure relations in the gallbladder and bile ducts [9 18–26] Before cholecystectomy the normal ductal pressure is about 15 cm of water The maximal pressures of the gallbladder liver, and pancreas are from 20 to 30 cm of water [18 22] As long as these pressure relationships are maintained, the tension of the biliary tract is below the level of consciousness of the patient Under certain conditions the sphincter of Oddi may become irritable, spastic, or hypertrophied In this state it may be able to resist a pressure of 75 cm of water [19] A spasm of the common duct can cause a sudden overdistention of the biliary tract with epigastric pain colic and sometimes nausea and vomiting [9 19 20 24 27,28]

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Gastroenterology and Proctology May 20 1948.

Experimentally, many investigators have produced pain and colic, both in animals and humans, by overdistention of the gallbladder or bile ducts [8,10,19–23 25,27,28] The same effect of increased intraductal pressure and subsequent pain can be produced, as is shown by manometric readings or by creating a spasm of the common duct sphincter The spasm can result from an injection of morphine, the application of dilute hydrochloric acid to the ampulla, a psychic disturbance on the part of the patient, or by eating irritating foods [8,10 14 20,23 24 26]

Clinical investigations have shown that patients in whom pain was produced experimentally postoperatively had the same types of pain preoperatively, as the result of increased intraductal tension secondary to calculus obstruction or common duct sphincter spasm.[8] Excessive dilatation of the common duct was found to occur in patients having advanced gallbladder disease in a series of autopsy specimens examined by Benson [13] A similar amount of common duct dilatation occurred postoperatively only in those patients having recurrent attacks of pain

Calculus obstruction of the cystic or common duct results in pain, frequently with nausea and vomiting [8] Any other type of obstruction, such as those due to kinks or inflammatory changes or severe common duct sphincter spasm, can produce the same symptoms These are especially apt to occur in patients having an intolerance to fats

Obstruction of the ampulla of Vater, either by stone or spasm, can cause postcholecystectomy symptoms and may result in disease of the liver, biliary ducts, or pancreas [1 4 22 31] Doubilet found that in the gallbladder the regurgitation of the pancreatic ferments changed the normal acid reaction of the bile to alkaline with an activation of the pancreatic ferments by the infected bile and a resultant suppuration or gangrene [22] In surgical patients with cholecystitis, Womack and Haffner found extensive pathologic changes of the gallbladder wall as the result of obstruction, chemical inflammation of highly concentrated bile, and secondary infection.[30] An alteration in the usual bile salt-cholesterol ratio of the gallbladder bile may give changes of this character An excessive proportion of bile salts may give chemical inflammation, with edema, acute cholecystitis, or chronic inflammatory changes of the walls of the ducts or gallbladder An excessive proportion of cholesterol may result in the formation of gallstones or cholesterosis of the gallbladder

An important cause of the postcholecystectomy syndrome is stricture of the common duct [1 2 3 29] This may be traumatic in which there is jaundice sometimes with other symptoms of obstruction With benign fibrous stenosis there are more frequently symptoms of chills, fever, nausea, vomiting, and pruritus The same symptoms may occur with a common duct stone Jaundice occurs in 75 to 90 per cent of this group A retained remnant of a cystic duct may be associated with stones in the remnant of the gallbladder

Jaundice is a problem in differential diagnosis requiring prompt solution Organic extrahepatic obstruction requires early surgical intervention to prevent serious liver damage This type of biliary obstruction is caused by common duct stone, malignancy, pancreatitis, fibrosis, and other stenosing lesions Noncalculus organic obstruction is characterized by the gradual onset of jaundice, the initial absence of severe pain, and a progressive elevation in the serum bilirubin, alkaline phosphatase, and cholesterol Malignancy causes complete common duct obstruction In this case duodenal drainage gives no bile Blood or malignant cells may be found in the duodenal contents and are an aid in differential diagnosis With common duct stones, diagnostic tests indicate intermittent obstruction with, at times, crystalline sediment in the duodenal bile With pancreatitis there is usually an elevation in the amylase of the blood and urine for a few days after the onset of an acute attack

As a means of preventing postcholecystectomy symptoms the presence of symptom-producing stones or an infectious cholecystitis, with or without a concomitant cholangitis, should be promptly recognized and cholecystectomy performed as soon as possible [1 3,8 21 29] It is only in this way that we can prevent progressive pathologic changes While infections of the biliary tract can exist without symptoms, subsequent pathologic changes and ultimate obstructive lesions lead to increased operative mortality and progressive postoperative morbidity [6 12 21,29] Symptoms of recurrent pain, colic, chills, fever, nausea, vomiting, and jaundice are signs of advanced biliary tract disease, infection, or obstruction

The clinical diagnosis of infectious biliary tract disease, however, can be determined only by cultures of duodenal bile [13] As noted by Lyon, this is the only direct evidence of pathology available The accuracy of this method is shown in Table 1, which presents a comparative study of cultures taken from 120 patients Preoperative duodenal bile specimens were taken both before and after stimulation with olive oil, at operation, cultures were made of specimens taken from the gallbladder, the gallbladder wall, the gallstones, the common bile duct, and the cystic duct node if enlarged Of the 75 patients having all cultures of duodenal bile sterile, 74 had sterile cultures from all parts of the biliary tract at operation

Of 32 patients having significant pathogenic organisms in the duodenal drainage bile, 25 showed the same type of organisms in cultures taken from the biliary tract at operation (Table 1)

TABLE 1.—A Comparative Study of Sterile Cultures of Duodenal and Operative Bile in 120 Consecutive Cases

	Number of Patients*	
	Duodenal Drainage	Operative Cultures
Findings of diagnostic value		
Sterile, all cultures	75	74 1 positive
Pathogenic organisms, 1 or 2 types	32*	25 same type 3 different type 4 sterile
Total	107 (89%)	107
Findings not of diagnostic value		
Mixed growth 3 or more types	11	10 sterile 3 positive, different
Nonpathogenic organisms	2	
Total	120	120

* Ninety two per cent of cases showed agreement between duodenal drainage and operative findings

The routine diagnostic investigation of the clinic includes preoperatively a history, physical examination x ray, duodenal drainage, and blood chemistry Following cholecystectomy there are periodic follow up visits with repetition of the duodenal drainages and blood chemistries as indicated In patients coming to operation, an immediate cholangiogram is of great assistance in cases of suspected common duct pathology A delayed cholangiogram is routine in cases of "T" tube drainage before removal of the tube.

In the present group studied there were 295 patients 264 women and 31 men all of whom had had a cholecystectomy The distribution of symptoms is shown in Table 2

TABLE 2.—Distribution of Symptoms in 295 Patients

	Number	Per Cent

Total*	150	

* Excluding the 34 active cholangitis cases included in other groups.

Groups without Postoperative Symptoms

Calculus Group (121 Patients 109 Women, 12 Men) —The histories and physical examinations revealed no significant differences from those in patients not relieved of symptoms Cholecystograms were abnormal in showing no visualization, impaired visualization, or stones in all but seven cases The duodenal drainage was abnormal in showing no concentrated gallbladder bile in 68 of 118 drainages Sterile cultures of duodenal bile were accurate indicators of infectious biliary tract disease in most cases, operative cultures were reported sterile in 79 patients and pathogenic in 12 Blood chemistries were normal in practically all cases. The operative diagnoses in this group included ten cases of acute or subacute cholecystitis, seven cases of hepatitis, six cases of hydrops of the gallbladder, three cases of empyema of the gallbladder, and three cases of pancreatitis The diagnosis of chronic appendicitis was made 47 times, with appendectomy in each case.

Noncalculus Group (35 Patients 32 Women, 3 Men) —Following cholecystectomy, 15 patients in this group had no significant symptoms The average age of this group was forty five years. Histories and physical examinations were similar to those patients having calculi The cholecystogram showed normal visualization in ten patients, impaired visualization in five Delayed emptying of the gallbladder was not reported in this group Duodenal drainage findings and blood chemistries did not show significant differences in the two groups One third of these patients had infections of the biliary tract at operation

Groups with Postoperative Symptoms

Noncalculus Group —Twenty of these patients (all women) had symptoms following cholecystectomy The average age of this group was thirty seven years, eight years below that of the group relieved of symptoms. The average interval between operation and the onset of symptoms in 15 of the 20 patients was three months This contrasts with a similar average interval of three years in the calculus dyskinesia group The x ray and drainage findings were similar to those in the group relieved of symptoms, except that delayed emptying of the gallbladder following a fatty meal was reported in four cases Operative findings were similar except for the presence of adhesions noted in 12 cases of this group and in only two cases relieved of symptoms by operation

Dyskinesia Group (70 Patients 64 Women, 6 Men) —The review of the histories in this calculus group before and after operation indicated that only 51 patients had severe pain before operation and 52 had pain after operation. Fol-

lowing operation, the number of patients having right upper quadrant pain was reduced from 32 to 28, the number having epigastric pain, however, increased from 19 to 24

Interesting contrasts in symptoms were noted as shown in Table 3

TABLE 3 —Contrasts in Symptoms of Dyskinesia Group

Symptoms	—Number of Patients— Before Operation	After Operation
Pain		
Right upper quadrant	32	28
Epigastric	19	24
Nausea	32	42
Tenderness right upper quadrant	28	20
Fat intolerance	26	34
Vomiting	22	23
Jaundice	2	4

The average interval between operation and the onset of symptoms in 15 of the 20 patients in whom records were available was three years

Physical examinations were not of diagnostic value X-ray studies showed a high incidence (14 cases) of delayed emptying of the gallbladder, a finding not noted in the group relieved by operation Duodenal drainage in this group showed gastric hyperacidity in ten of 70 cases, the highest incidence of any group studied Another abnormal finding was that, following operation, concentrated bile was found in 49 of 99 drainages (normal postoperative bile is not concentrated) At operation most of these patients had a diagnosis of chronic cholecystitis An appendectomy was done in 13 patients Cultures at operation were sterile in 36 cases, positive in ten

The diagnosis of "reflex dyskinesia" was made in 19 patients Associated diagnoses in other cases were duodenitis, 14, psychoneurosis, three, pregnancy, two, migraine, two, stricture of ureter, two, and arthritis of spine, two

The treatment consisted of a bland diet, sedatives, antispasmodics, antacids when indicated, the relief of constipation, and an attempt to adjust the patient to environmental difficulties The results of treatment were that approximately 40 per cent were considered satisfactorily improved, 32 per cent temporarily relieved of symptoms, and 28 per cent not improved

It is our opinion that in this group the incidence of postcholecystectomy symptoms could have been lowered if the presence of dyskinesia had been recognized before cholecystectomy, and the appropriate therapy instituted promptly after operation

Surgical treatment was not employed for relief of symptoms in this group In general, surgery is considered advisable only after the failure of medical treatment, when there is evidence of recurrent jaundice or liver damage Short circuiting operations have been used with reluctance, preferably in those patients having free hydrochloric acid, to act as a protective mechanism against cholangitis Successful operation requires the maintenance of a large stoma between the bile ducts and intestines for the relief of symptoms Operations to dilate or cut the sphincter of Oddi have not been performed sufficiently often enough to formulate an opinion as to their value

Cholangitis, Active (34 Patients, All Included in Other Groups of Pathology) —This group of patients proved to have pathologic conditions of the biliary tract associated with the persistence of pathogenic organisms in the duodenal bile The diagnoses of those patients having positive cultures at operation were as follows retained common duct stone, 11, benign fibrosis, nine, dyskinesia, four, hepatitis, two, pancreatitis, one, and carcinoma of papilla, one, making a total of 28

Organisms present were in most cases Escherichia coli There were a few cases of Eberthella typhosus, Bacillus welchii, streptococcus, staphylococcus, and mixed organisms

Active cholangitis is a complication associated with biliary tract obstruction Its surgical treatment consists in the relief of the obstruction When infection was known to exist or was suspected by the appearance of the bile ducts or liver at operation, provision was made for adequate prolonged drainage Antibiotics, such as penicillin and streptomycin, while usually ineffective in ridding the ducts of infectious organisms, have been used extensively in both the preoperative and postoperative periods

Common Duct Injury (23 Cases 19 Women, 4 Men) —Most of these patients had had a cholecystectomy elsewhere The diagnosis in this group was determined at the time of re-operation The usual finding was a localized area of stricture with uniform dilatation of the duct above the stricture and an otherwise normal cystic duct except for a biloma proximal to the constriction The onset of symptoms was immediately after operation in 12 cases, the average interval was six months in 20 cases The history of this group showed pain in 17 cases, seven with dull pain and ten with colic The location of the pain was epigastric in seven cases, in the right upper quadrant in eight Jaundice was present in 13, chills and fever in 12, nausea and vomiting in seven, tenderness of the right upper quadrant in eight, fat intolerance in seven Duodenal drainage in this group rarely showed concentrated bile Seven had cultures positive for Escherichia coli Blood chemistry showed an elevation of the serum bilirubin and cholesterol in most cases

Operative diagnoses included, in addition to the diagnosis of common duct stenosis, the follow-

ing common duct stones five, pancreatitis, three, ulceration of duodenum, one, retained cystic duct remnant, one, and cut common bile duct, one

Cultures taken at operation in 18 cases were sterile in seven cases, pathogenic organisms were found in 11 Nine of the positive cultures were E coli

Operations performed were choledochoduodenostomy nine, hepaticoduodenostomy, nine, revision of hepaticoduodenostomy, three, and plastic repair of hepatic duct four

Table 4 gives a comparative study of the symptoms and physical findings in the dyskinesia group, as compared with the organic common duct obstruction cases (common duct injury and benign fibrous stenosis) It is apparent here that the symptoms of pain and colic, nausea, vomiting, and fat intolerance are more prevalent in the dyskinesia group With organic obstruction on the other hand, the characteristic symptoms were jaundice, chills fever, pruritus, and biliary *fistula*

TABLE 4.—PERCENTAGE OF PATIENTS SHOWING ABNORMAL LABORATORY FINDINGS IN FUNCTIONAL AND ORGANIC OBSTRUCTION OF THE COMMON BILE DUCT FOLLOWING CHOLECYSTECTOMY

	Dyskinesia	Organic Common Duct Obstruction
Number of patients	70	32
Duodenal drainage		
Concentrated bile %	49	86
Cultures		
Sterile, %	87	34
Pathologic, %	13	66
Blood chemistry (elevation)		
Icterus index, %	8	78
Cholesterol, %	15	72
Alkaline phosphatase, %	0	12
Operative cultures		
Sterile %	78	34
Pathogenic %	22	66

Repeated operations were necessary in many patients of this group In some cases five to eight operations had been performed on the same patient before admission to our clinic Operative procedures were based upon the findings in the individual case

Cholangitis Inactive (15 Patients 10 Women 5 Men)—In this group without symptoms repeated duodenal drainages showed the presence in the bile of some pathogenic organisms, 13 had E coli The average age of this group was fifty years five of the patients being over sixty Before operation ten of these patients had tenderness of the right upper quadrant or an enlarged liver All were relieved following operation On duodenal drainage 13 had no free hydrochloric acid in the fasting gastric contents Eleven had highly concentrated bile, indicating probable inflammatory involvement of the sphincter of Oddi

The conclusions relative to this group are that the presence of cholangitis in the absence of obstruction does not produce symptoms. These patients, however, should be carefully followed and treated for any functional disturbances which may produce obstruction

Surgery is not indicated in this group unless the patient is a typhoid carrier A continuation of the typhoid carrier state after cholecystectomy justifies an exploration and a complete removal of the cystic duct if there is any reason to believe that this had not been done adequately at the first operation

Common Duct Stones (11 Patients 10 Women 1 Man)—The histories of these patients are shown in Table 5 Recurrent symptoms began within one year in six cases, the average interval was one month For the remaining five cases, however, average interval before onset of symptoms was twelve years Physical examination revealed jaundice in seven patients, tenderness in the right upper quadrant in five in only one case was the liver palpably enlarged

TABLE 5.—AN ANALYSIS OF SYMPTOMS AND PHYSICAL FINDINGS IN SPASTIC, INTERMITTENT, AND ORGANIC TYPES OF OBSTRUCTION OF THE COMMON BILE DUCT FOLLOWING CHOLECYSTECTOMY

	Dyskinesia	Common Duct Stones	Organic Common Duct Obstruction
Number of patients	70	11	32
Symptoms

Fistula (bile)	0	0	6 (18%)
Interval between operation and onset of symptoms			
Average time	3 years*	1 month	4 months (29 cases)
Physical examination			
Tender right upper quadrant	18(25%)	5	1 (37%)
Enlarged liver	2 (3%)	1	12 (37%)

Records available in 20 cases

Duodenal drainage in this group showed pathogenic organisms in practically all cases, the predominating organism being E coli Chemical blood examinations indicated in most cases intermittent elevation in the blood cholesterol serum bilirubin, and alkaline phosphatase with positive cephalin flocculation tests in some cases Operative findings in this group included three cases of pancreatitis and six cases of retained remnant of cystic duct. Stones were present in three of the dilated gallbladder remnants. Cultures at operation were positive in eight cases six of these were E. coli

lowing operation, the number of patients having right upper quadrant pain was reduced from 32 to 28, the number having epigastric pain, however, increased from 19 to 24

Interesting contrasts in symptoms were noted as shown in Table 3

TABLE 3.—CONTRASTS IN SYMPTOMS OF DYSKINESIA GROUP

Symptoms	Number of Patients—Before Operation	After Operation
Pain		
Right upper quadrant	32	28
Epigastric	19	24
Nausea	32	42
Tenderness right upper quadrant	28	20
Fat intolerance	26	34
Vomiting	22	23
Jaundice	2	4

The average interval between operation and the onset of symptoms in 15 of the 20 patients in whom records were available was three years

Physical examinations were not of diagnostic value X-ray studies showed a high incidence (14 cases) of delayed emptying of the gallbladder, a finding not noted in the group relieved by operation Duodenal drainage in this group showed gastric hyperacidity in ten of 70 cases, the highest incidence of any group studied Another abnormal finding was that, following operation, concentrated bile was found in 49 of 99 drainages (normal postoperative bile is not concentrated) At operation most of these patients had a diagnosis of chronic cholecystitis An appendectomy was done in 13 patients Cultures at operation were sterile in 36 cases, positive in ten

The diagnosis of "reflex dyskinesia" was made in 19 patients Associated diagnoses in other cases were duodenitis, 14, psychoneurosis, three, pregnancy, two, migraine, two, stricture of ureter, two, and arthritis of spine, two

The treatment consisted of a bland diet, sedatives, antispasmodics, antacids when indicated, the relief of constipation, and an attempt to adjust the patient to environmental difficulties The results of treatment were that approximately 40 per cent were considered satisfactorily improved, 32 per cent temporarily relieved of symptoms, and 28 per cent not improved

It is our opinion that in this group the incidence of postcholecystectomy symptoms could have been lowered if the presence of dyskinesia had been recognized before cholecystectomy, and the appropriate therapy instituted promptly after operation

Surgical treatment was not employed for relief of symptoms in this group In general, surgery is considered advisable only after the failure of medical treatment, when there is evidence of recurrent jaundice or liver damage Short circuiting operations have been used with reluctance, preferably in those patients having free hydrochloric acid, to act as a protective mechanism against cholangitis Successful operation requires the maintenance of a large stoma between the bile ducts and intestines for the relief of symptoms Operations to dilate or cut the sphincter of Oddi have not been performed sufficiently often enough to formulate an opinion as to their value

Cholangitis, Active (34 Patients, All Included in Other Groups of Pathology).—This group of patients proved to have pathologic conditions of the biliary tract associated with the persistence of pathogenic organisms in the duodenal bile The diagnoses of those patients having positive cultures at operation were as follows retained common duct stone, 11, benign fibrosis, nine, dyskinesia, four, hepatitis, two, pancreatitis, one, and carcinoma of papilla, one, making a total of 28

Organisms present were in most cases Escherichia coli There were a few cases of Eberthella typhosus, Bacillus welchii, streptococcus, staphylococcus, and mixed organisms

Active cholangitis is a complication associated with biliary tract obstruction Its surgical treatment consists in the relief of the obstruction When infection was known to exist or was suspected by the appearance of the bile ducts or liver at operation, provision was made for adequate prolonged drainage Antibiotics, such as penicillin and streptomycin, while usually ineffective in ridding the ducts of infectious organisms, have been used extensively in both the preoperative and postoperative periods

Common Duct Injury (23 Cases 19 Women, 4 Men).—Most of these patients had had a cholecystectomy elsewhere The diagnosis in this group was determined at the time of re-operation The usual finding was a localized area of stricture with uniform dilatation of the duct above the stricture and an otherwise normal cystic duct except for a biloma proximal to the constriction The onset of symptoms was immediately after operation in 12 cases, the average interval was six months in 20 cases The history of this group showed pain in 17 cases, seven with dull pain and ten with colic The location of the pain was epigastric in seven cases, in the right upper quadrant in eight Jaundice was present in 13, chills and fever in 12, nausea and vomiting in seven, tenderness of the right upper quadrant in eight, fat intolerance in seven Duodenal drainage in this group rarely showed concentrated bile Seven had cultures positive for Escherichia coli Blood chemistry showed an elevation of the serum bilirubin and cholesterol in most cases

Operative diagnoses included, in addition to the diagnosis of common duct stenosis, the follow-

ing common duct stones five, pancreatitis, three, ulceration of duodenum, one, retained cystic duct remnant, one, and cut common bile duct one

Cultures taken at operation in 18 cases were sterile in seven cases pathogenic organisms were found in 11 Nine of the positive cultures were E coli

Operations performed were choledochoduodenostomy, nine, hepaticoduodenostomy nine revision of hepaticoduodenostomy, three, and plastic repair of hepatic duct, four

Table 4 gives a comparative study of the symptoms and physical findings in the dyskinesia group, as compared with the organic common duct obstruction cases (common duct injury and benign fibrous stenosis) It is apparent here that the symptoms of pain and colic, nausea, vomiting and fat intolerance are more prevalent in the dyskinesia group With organic obstruction on the other hand, the characteristic symptoms were jaundice chills fever, pruritus, and biliary fistula

TABLE 4.—PERCENTAGE OF PATIENTS SHOWING ABNORMAL LABORATORY FINDINGS IN FUNCTIONAL AND ORGANIC OBSTRUCTION OF THE COMMON BILE DUCT FOLLOWING CHOLECYSTECTOMY

	Dyskinesia	Organic Common Duct Obstruction
Number of patients	70	32
Duodenal drainage		
Concentrated bile %	49	36
Cultures		
Sterile %	87	34
Pathologic %	13	66
Blood chemistry (elevation)		
Icterus index %	8	78
Cholesterol %	16	72
Alkaline phosphatase %	0	12
Operative cultures		
Sterile %	78	34
Pathogenic %	22	66

Repeated operations were necessary in many patients of this group In some cases five to eight operations had been performed on the same patient before admission to our clinic Operative procedures were based upon the findings in the individual case.

Cholangitis, Inactive (15 Patients 10 Women 5 Men) —In this group without symptoms repeated duodenal drainages showed the presence in the bile of some pathogenic organisms 13 had E coli The average age of this group was fifty years, five of the patients being over sixty Before operation ten of these patients had tenderness of the right upper quadrant or an enlarged liver All were relieved following operation On duodenal drainage 13 had no free hydrochloric acid in the fasting gastric contents. Eleven had highly concentrated bile, indicating probable inflammatory involvement of the sphincter of Oddi

The conclusions relative to this group are that the presence of cholangitis in the absence of obstruction does not produce symptoms These patients however, should be carefully followed and treated for any functional disturbances which may produce obstruction

Surgery is not indicated in this group unless the patient is a typhoid carrier A continuation of the typhoid carrier state after cholecystectomy justifies an exploration and a complete removal of the cystic duct if there is any reason to believe that this had not been done adequately at the first operation

Common Duct Stones (11 Patients 10 Women, 1 Man) —The histories of these patients are shown in Table 5 Recurrent symptoms began within one year in six cases the average interval was one month For the remaining five cases, however average interval before onset of symptoms was twelve years. Physical examination revealed jaundice in seven patients tenderness in the right upper quadrant in five in only one case was the liver palpably enlarged

TABLE 5 —AN ANALYSIS OF SYMPTOMS AND PHYSICAL FINDINGS IN SPASTIC INTERMITTENT, AND ORGANIC TYPES OF OBSTRUCTION OF THE COMMON BILE DUCT FOLLOWING CHOLECYSTECTOMY

	Dyskinesia	Common Duct Stones	Organic Common Duct Obstruction
Number of patients	70	11	32
Symptoms			
Pain			
Dull	38 (54%)	4	11 (34%)
Colic	36 (51%)	7	12 (37%)

Pruritus	0	0	10 (23%)
Fistula (bile)	0	0	6 (18%)
Interval between operation and onset of symptoms			
Average time	3 years*	1 month	4 months (29 cases)
Physical examination			
Tender right upper quadrant	18(25%)	5	12(37%)
Enlarged liver	2 (3%)	1	12 (37%)

Records available in 70 cases.

Duodenal drainage in this group showed pathogenic organisms in practically all cases the predominating organism being E coli Chemical blood examinations indicated in most cases intermittent elevation in the blood cholesterol, serum bilirubin, and alkaline phosphatase with positive cephalin flocculation tests in some cases Operative findings in this group included three cases of pancreatitis and six cases of retained remnant of cystic duct Stones were present in three of the dilated gallbladder remnants. Cultures at operation were positive in eight cases, six of these were E coli

Most stones found in the common duct were faceted or laminated in appearance, suggesting that they had originated in the gallbladder, been extruded into the common bile duct, and overlooked at the time of cholecystectomy Another type is the dark, amorphous or crystalline, calcium bilirubinate stone This type of stone, however, is more likely to have been formed after cholecystectomy When removed, it may reform Some patients have required as many as eight operations for recurrent stones of this character Occasionally, a short circuiting operation is necessary to relieve biliary stasis

Retained Cystic Duct Remnant (8 Cases 5 Women, 3 Men)—The history of this group revealed colic in five cases, location epigastric in four Jaundice, chills, and fever occurred in seven cases, nausea and vomiting in six The average interval between operation and the onset of symptoms in two cases was five and one-half months, in the remaining six cases the average interval was fourteen years Physical examination showed a tender liver in six cases The blood chemistry in this group showed an elevation of the serum bilirubin in five cases, and the cholesterol was elevated in three cases

Operative findings revealed stones in the gallbladder remnants in three cases, stones in the common duct in five cases Hepatitis was noted in three patients, pancreatitis in two Cultures at operation were of interest in that all eight cases had positive cultures, six of these showed two organisms—one was usually E coli At operation the gallbladder remnants were of two types

1 A portion of the gallbladder left because of high amputation Stones present were probably overlooked at the first operation, since all patients in whom stones were found had stones at the time of cholecystectomy

2 A dilated remnant of the gallbladder, consisting of the cystic duct and a portion of the ampulla of gallbladder, with a dilatation of the common bile duct Regeneration of the gallbladder is probably the best designation of this condition.

Treatment in the former group consisted in the removal of the remnant and stones In the latter group the obstructive lesion of the common duct was of far more importance than the gallbladder remnant The treatment was dependent upon the cause of the common duct obstruction

Benign Fibrous Stenosis (9 Cases)—The nine patients of this group showed at operation a diffuse fibrotic thickening of the common or hepatic bile ducts, as differentiated from the localized constriction and proximal dilatation of the common duct found following definite injury Colic in this group was rare, jaundice being the outstanding symptom Pruritus occurred in four patients On physical examination six of the nine patients had an enlarged, tender liver The average onset of symptoms after operation was two months, most cases occurring promptly The blood chemistry was an important diagnostic finding, all patients showed a definite elevation in blood cholesterol and serum bilirubin (Table 4)

Operative procedures in this group were varied Short circuiting procedures were favored For intrahepatic duct lesions, dilatation and prolonged drainage by "T" tube was used, the superior fork of the tube extending through the strictured area

Little is known about the underlying cause of this type of fibrosis The onset may be acute During this phase the bile ducts appear to be acutely inflamed and the mucous membrane lining the ducts hemorrhagic in appearance The surrounding lymph glands are enlarged and inflamed All of the structures of the gastrohepatic ligament appear to be undergoing an inflammatory reaction to a powerful agent Culture studies for bacteria in the early stages have not been conclusive

The stage of fibrosis may be complicated by stricture, perforation, and subsequent obstruction to bile flow The lesion may be regional, being found in any part of the intra- or extrahepatic ducts In many respects this regional choledochitis resembles regional ileitis

Pancreatitis (3 Cases 2 Women, 1 Man)—In three patients pancreatitis was found to be responsible for postoperative symptoms A man of sixty-six years was found to have pancreatitis at the time of a re-operation for stones In one case there was found fat necrosis, in another an enlarged liver In two women the diagnosis of pancreatitis had been made at the time of a cholecystectomy Two of the patients had cultures of E coli from the biliary tract at operation, cultures from the third were sterile Two patients were considered cured following operation The third with a duodenal diverticulum and a persistent colon infection in the biliary tract continued to have symptoms over a period of six years observation

Surgical treatment of pancreatitis by "T" tube drainage of the common bile duct is indicated after cholecystectomy as it was before or at the time of the primary operation Removal of the associated obstructive factor, stones when found, followed by prolonged drainage suffices, and recurrences of pancreatitis are infrequent Diagnosis of the obstructing factors present by means of the cholangiogram is becoming more accurate When obstructing factors that cannot be corrected directly are encountered, an operation to short circuit the flow of bile around the obstruction to the intestine has been chosen

Summary

1 Symptoms of biliary tract disease before and after cholecystectomy are due to pathologic disturbances resulting from conditions which may be inflammatory, metabolic, mechanical, or functional in origin.

2 The presence of functional disorders, with or without organic disease should be determined before cholecystectomy

3 The incidence of postcholecystectomy syndrome can be lowered by the use of a comprehensive diagnostic investigation before cholecystectomy

4. In patients having symptoms after cholecystectomy, a similar diagnostic work-up is of value in determining the cause of symptoms and in indicating specific treatment.

5 In functional disturbances medical therapy is indicated. When functional disorders are concomitant with organic disease, this diagnosis should be established before cholecystectomy Medical therapy should be instituted promptly after operation

6 Surgery is indicated for calculus, infectious, and obstructive disease of the biliary tract.

7 The usual findings in patients who require surgery are

(a) Pain (especially recurrent), jaundice, nausea, vomiting, chills, fever, and occasionally pruritus

(b) Physical findings of tenderness in the right upper quadrant, sometimes with an enlarged liver

(c) Duodenal drainage findings of pathogenic organisms in the bile

(d) Blood chemistry Elevation in serum bilirubin alkaline phosphatase, and cholesterol

MIGRAINE HEADACHE RELIEF POSSIBLE WITH HISTAMINE

Relief for migraine headache sufferers is possible with the body chemical believed involved in allergy histamine, according to two Mayo Clinic physicians, Dorothy Macy, Jr., and Bayard T Horton.

Their description of the treatment of 144 patients with migraine headache at this clinic from 1937 to 1946 appears in the *Journal of the American Medical Association* for July 24.

While 98 of these patients showed a 25 to 100 per cent improvement, they emphasize that histamine is not a cure for the condition.

Drs. Macy and Horton stated that freedom from migraine attacks in these patients paralleled the period of treatment with histamine. They declared that patients who were free of symptoms after one year or more were still taking histamine once daily or every other day —*Science News Letter August 7 1948*

ACUTE PANCREATITIS

H L Bockus, M D , and Edward C Raffensperger, M D , Philadelphia, Pennsylvania

(*From the Graduate Hospital of the University of Pennsylvania*)

A GOOD concept of the pathologic characteristics of acute catastrophic inflammation of the pancreas may be gleaned from the first comprehensive description of acute pancreatitis given by Fitz in 1889 [1–3] At present the severe form of acute pancreatitis associated with necrosis of the pancreas and surrounding tissues is usually designated acute necrosis of the pancreas Neither hemorrhage nor suppuration accompanies the inflammation in every instance One or the other, or both, may be present in varying degrees The necrotic lesion is due to the liberation of pancreatic enzymes, giving rise to the white opaque areas of so-called fat necrosis, described by Balser in 1882 [4]

As a result of observations at necropsy and operation, together with the accrued experience of many observers with pancreatic serum enzyme determinations, many instances of less severe acute inflammation of the pancreas with little or no necrosis have been recognized and described [5–7] This milder type of inflammation has been termed edema of the pancreas, subacute pancreatitis, acute transient pancreatitis, or interstitial pancreatitis As compared with acute necrosis of the pancreas, usually in so-called edema of the pancreas, the clinical symptoms and signs are milder, serum enzyme values are lower, and perhaps there is a lessened likelihood of occurrence of delayed hypocalcemia Acute edema of the pancreas has been recognized most often in association with acute episodes of biliary tract disease In fact, it has become customary to consider acute edema of the pancreas as being commonly due to acute episodes of biliary tract disease It should be borne in mind, however, that any mechanism which is capable of causing acute necrosis may at times cause only edema of the pancreas without concomitant necrosis Perhaps the only tenable concept concerning the pathogenesis of acute pancreatitis is that all grades of acute inflammation of the pancreas, with or without massive necrosis, are but manifestations of the same basic process, merely representing varying degrees of inflammatory response to the insulting agent Various factors undoubtedly enter into the degree of response which occurs They must include the following (1) the modus operandi of the inciting cause or causes, (2) the presence or absence of obstruction to the outflow of pancreatic juice, (3) the presence or absence of antecedent pancreatic inflammation, (4) the degree of escape of pancreatic enzymes into the surrounding tissues, and (5) the presence or absence of a disturbance of the blood supply to the pancreas In the early stages of an attack it is not possible to prognosticate with certainty whether the inflammation will be characterized by edema alone with little or no necrosis or whether extensive necrosis will take place

It is only during the last decade that the early diagnosis of acute pancreatitis has become a frequent achievement, and that a procedural pattern for therapy has been established Our interest in acute inflammation of the pancreas has been renewed recently as a result of a review of patients encountered on the gastrointestinal service at the Graduate Hospital during a fourteen-month period extending from March, 1946, to May, 1947 During this time, ten patients with the disease were studied A review of data derived from this case study serves to emphasize the lack of ability to make a clinical diagnosis at the bedside and the efficacy of certain laboratory procedures in differential diagnosis A plan of therapy based on a knowledge of the physiology of the pancreas has yielded excellent results Six detailed case reports will be found at the end of the article * The other four cases are not reported in detail here since clinical observation and operation indicated that the patients had had an underlying chronic interstitial pancreatitis They were admitted and studied during an episode of superimposed acute inflammation of the pancreas No effort is made to review completely all of the various features of acute pancreatitis We wish to stress the importance of certain laboratory procedures in differential diagnosis and the efficiency of conservative medical management during the acute fulminant stage of the disease

Etiologic Features

The present status of knowledge of the cause and pathogenesis of acute pancreatitis has been given elsewhere [8] No effort is made to elaborate upon these features at this time Two etiologic factors have been of great importance in our patients They are a history of the excessive im-

Presented by invitation, at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Gastroenterology and Proctology May 20, 1948

* Due to lack of space the individual case reports cannot be included with this paper but may be found in the authors reprints

bibing in alcohol and the presence of biliary tract disease A history of the excessive use of alcohol was obtained in four patients (40 per cent) in whom no evidence of biliary tract disease could be found In an additional patient both alcoholic excesses and gallbladder disease were noted Thus, in 50 per cent of our patients a history of excessive use of alcohol was obtained In three of these the acute attack responsible for the patient's admission followed excessive drinking Although the prevalence of pancreatic disease among chronic alcoholics has been noted, too little attention has been given to the relative frequency of attacks of acute pancreatitis following bouts of excessive drinking [9 10]

It has been stated that in 60 to 80 per cent of cases of acute pancreatitis biliary tract disease has been considered to have etiologic importance [11] Biliary tract disease was present and probably accounted for the pancreatic insult in five of these patients. In one an addiction to alcohol was also found. It is of interest that obstructive jaundice was a feature of the illness in four patients The preoperative diagnosis of acute pancreatitis in each instance was made only by the finding of an increased concentration of the pancreatic serum enzymes It is of great practical importance to keep in mind the possibility of insult to the pancreas during the course of acute biliary tract inflammation, particularly if associated with jaundice. If pancreatic serum enzyme determinations are not routinely performed in all patients with biliary colic, certainly these tests should be carried out under the following circumstances (1) pain of greater severity than one usually encounters in association with biliary colic, (2) radiation of pain to the left epigastrium and/or to the region of the left scapula, (3) the presence of marked muscle guarding bordering on rigidity, (4) a greater degree of constitutional reaction than one usually finds in biliary colic—higher fever markedly increased pulse rate and marked leukocytosis (5) the association of mild shock or vascular skin changes which occur at times in association with acute pancreatitis and (6) a lack of relief of pain following hypodermic injection of opiates It is essential to keep this association in mind since it is unwise to operate in the presence of acute severe inflammation of the pancreas if it can be avoided A pancreatic rest regimen should be instituted at once and the patient carefully watched

It is of interest that in this series only one patient was encountered with acute pancreatitis who did not use alcohol to excess or who did not have evidence of biliary tract disease.

Clinical Features

Almost all experienced clinicians freely admit that acute pancreatitis follows no consistent symptom pattern The location of the initial pain is frequently not characteristic, although commonly it is experienced in the epigastrium. Not infrequently the initial pain may be in the lower abdomen in the lumbar region, beneath the sternum or in the left chest The character of the pain is not consistent, often it is sharply intense and constant, but not rarely it may be dull and at times somewhat intermittent The more usual epigastric pain may radiate to the left and to the area of the first or second lumbar vertebra However, radiation may take place in almost any direction.

Acute pancreatitis masquerades in many different guises One of the most dramatic is an onset simulating that of other acute abdominal emergencies like that of free perforation of peptic ulcer or ruptured viscus Oftentimes, as compared with perforated viscus, the abdominal wall in acute pancreatitis is less rigid and one is less likely to encounter the so-called 'silent abdomen" The pain in pancreatitis is often of lesser severity than the initial pain of perforated peptic ulcer and radiation to the tip of the shoulder is less common However in acute catastrophic inflammation of the pancreas the shocklike state is often more intense and more lasting

The shocklike state may attract greatest attention in some patients This in combination with high epigastric substernal or high back pain, may cause one to suspect an acute coronary occlusion The shocklike state in acute pancreatitis may cause consideration to be given to other vascular accidents particularly acute mesenteric occlusion More than an ordinary suspicion of an acute pancreatitis should be aroused if the curious skin changes happen to appear These include a peculiar cyanosis or patches of slate-blue color distributed over the abdomen and limbs and a queer brownish discoloration appearing below the ribs posteriorly or petechial patches, particularly in the region of the buttocks. A queer mottling of the skin of the limbs has also been described These signs are not commonly present but if they do exist in a patient suspected of having acute pancreatitis, they may add some support to that diagnosis

Acute pancreatitis occasionally mimics small bowel obstruction because of the tendency for small intestinal adynamic ileus to occur in some of the more ill patients. In one of our patients intestinal obstruction was given serious consideration on admission. One could go on mentioning many other conditions which are mimicked by acute inflammation of the pancreas. In the cases which we have reviewed, some consideration was given to the diagnosis of acute alcoholic gastritis, acute appendicitis, and acute pneumonitis It

should be borne in mind that, even in association with acute severe necrosis of the pancreas, the symptoms may be very mild and go unrecognized This is particularly true in pancreatitis occurring in association with biliary colic

The difficulties in arriving at a diagnosis based on clinical bedside methods will become obvious to the reader by perusal of the case reports We should like to draw attention to the bizarre clinical picture presented by case J R His family physician gave primary attention to the possibility of coronary occlusion Upon arrival in the hospital, the physical examination revealed suggestive signs of a pneumonitis at the left base, which was confirmed by roentgen studies At this time the abdominal signs were minimal Some hours later, one of us found exquisite tenderness in the lower right abdominal quadrant, sufficient to arouse a suspicion of the presence of acute appendicitis Somewhat later, tenderness was also found in the lower left abdominal quadrant, and some thought was given to a primary acute diverticulitis The diagnosis became clear only with the arrival of the report on the serum amylase concentration, which was 1,068 mg

Another patient illustrating the difficulties of bedside diagnosis was H F When he arrived in the admission ward, the house officer gave serious consideration to a volvulus of the sigmoid with complete intestinal obstruction because of the degree of abdominal distention which seemed more marked in the lower left abdominal quadrant

As a result of our recent experiences we are prepared to state unequivocally that a bedside diagnosis of acute pancreatitis is rarely, if ever, possible.

Blood Serum Enzyme Tests

Fortunately, we have in the serum enzyme tests a means of establishing the diagnosis of acute inflammation of the pancreas These tests have great value in the differential diagnosis of the so-called "abdominal emergencies" We have not encountered an instance of acute necrosis of the pancreas in which a marked hyperenzymemia has not been found during the first three days of the illness It should be stated, however, that one cannot with certainty exclude the presence of some degree of inflammation of the pancreas by obtaining negative blood serum enzyme tests We have recently studied a patient with chronic relapsing pancreatitis in whom, during the course of an acute episode of abdominal pain, undoubtedly of pancreatic origin, there was no increase in the concentration of pancreatic enzymes in the blood Obviously, if the parenchyma of the pancreas has been destroyed by long-continued inflammation, then the manufacture of enzymes ceases, and one cannot expect to obtain evidence of hyperenzymemia Usually, even in patients with chronic interstitial pancreatitis, the blood serum enzymes are elevated during the course of an acute attack

We employ for determination of the serum amylase the saccharogenic method of Somogyi [12] The normal values by this method in our laboratory range between 60 and 140 mg For determining the concentration of serum lipase we use the Loerenhart method, modified by Cherry and Crandall, previously described [13,14] Normal values by this method in our hands do not exceed 1 0 cc

The amylase test has proved of greatest value in the diagnosis of acute pancreatitis for two reasons The determinations can be carried out within one hour, whereas the lipase test requires twenty-four hours In acute inflammation of the pancreas the rise in blood serum amylase occurs earlier It may be noted that the initial serum amylase concentration was abnormally high in all of the six cases reported in detail (Figs 1–6) In two of these patients the first determination for lipase was normal

The lipase determination has greatest value after the first forty-eight hours of the illness, and the concentration of serum lipase remains greater for a longer period of time than that of serum amylase Amylase is excreted from the body in most instances quite rapidly Evidently, the elimination of lipase from the body lags considerably behind that of amylase For these reasons it is advisable to test the serum for both enzymes when the presence of acute pancreatitis is suspected Figure 7 is a composite curve of the concentrations of serum amylase and lipase during the course of acute pancreatitis in eight patients

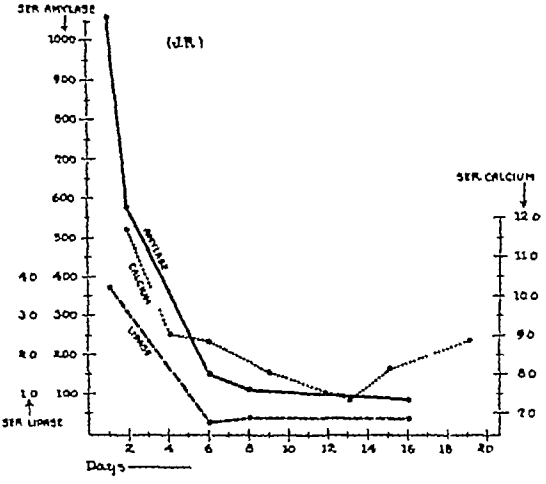

FIG 1 Behavior of pancreatic enzyme and calcium concentrations of the blood during the first attack of acute pancreatitis in case J R.

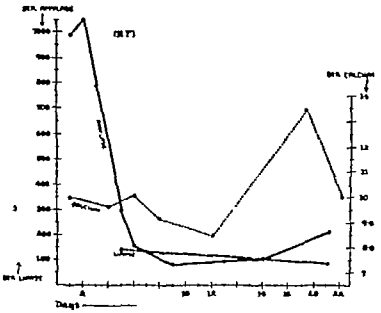

FIG 2. Curves of pancreatic enzymes and calcium values of the blood in very severe acute pancreatic necrosis in case H F

The frequent employment of serum enzyme tests is essential whenever the possibility of acute pancreatitis is under consideration. We employ these tests routinely in all patients suspected of fitting into any of the following categories (1) acute cholecystitis, (2) severe biliary colic (3) all patients with acute severe abdominal pain of undetermined origin, particularly those giving a history of excessive imbibing in alcohol or previous attacks attributed to biliary tract disease, (4) patients admitted with severe injury to the abdomen, and (5) patients admitted in a shocklike state. The frequent use of these tests probably accounts for the appreciable increase in the incidence of diagnosis of acute pancreatitis in the wards of the Graduate Hospital We should like to give a word of warning in the interpretation

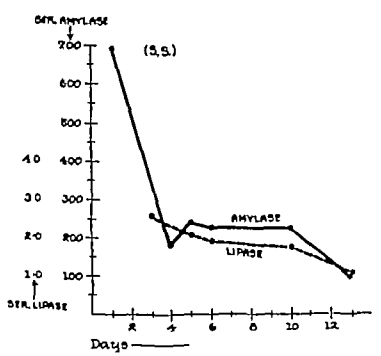

FIG 3 The curve of serum enzyme values in case S. S. The brief duration of the attack and the absence of striking constitutional signs suggest a lesser degree of inflammation than in cases J R. and H. F

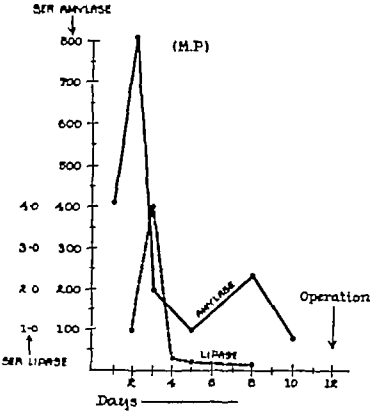

FIG 4 Chart of serum enzyme values in case M P, an example of acute pancreatitis occurring in association with biliary colic and jaundice.

of hyperenzymemia which is only moderate One of us (E. C R.) is accumulating data that suggest the occurrence of a moderate increase in the serum enzymes in other acute abdominal conditions not originating in the pancreas. At present, we look upon all patients showing increases in the concentration of serum amylase beyond five times the average normal values (500 mg or greater) as highly suggestive, if not indicative, of primary acute inflammation of the pancreas Values for amylase below five times the normal concentrations may possibly be the result of acute abdominal processes not originating in the pancreas

Blood Calcium Values

In acute pancreatitis white opaque areas of so-called fat necrosis are commonly seen on the surface of the pancreas and in the mesentery, omentum and parietal and visceral peritoneum These areas of fat necrosis' have been attributed

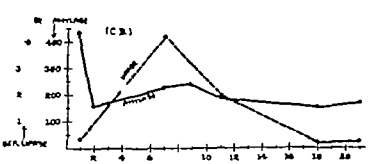

FIG 5 Case C. B is probably an example of acute edema of the pancreas in association with acute gastritis. Note the lag in the elevation of the blood serum lipase and the abrupt drop in the amylase value.

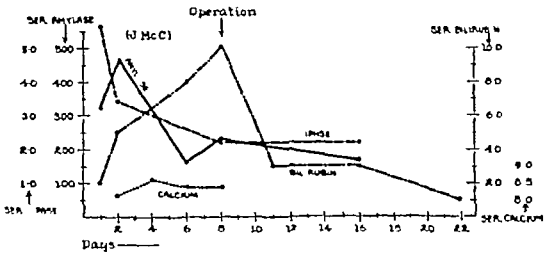

FIG 6 Serum enzyme, calcium and bilirubin values during the course of an attack of severe upper abdominal pain and jaundice Evidently an example of acute pancreatitis superimposed on chronic interstitial pancreatitis (J M)

to the action of pancreatic enzymes, which hydrolyze fat into glycerin and fatty acids, the latter then combine with calcium to form calcium soaps Recently, Edmondson and Berne have drawn attention to the marked mobilization of calcium in and around the pancreas as a result of the formation of calcium soaps [15] This shift in body calcium frequently resulted in a decreased concentration of calcium in the blood serum The latter concentration was below 9 mg per 100 cc of blood in 36 of 50 cases of pancreatic necrosis between the second and fifteenth day of the disease [15] According to these observers concentration of serum calcium below 7 mg entailed a fatal prognosis The lowest figure for the serum calcium in their series of patients was obtained on the sixth day of the disease

In four of our patients (40 per cent) the serum calcium values were reduced In two of them hypocalcemia was sufficiently marked to cause us to administer calcium intravenously The lowest serum calcium value in our patients was 7 4 mg per cent It is of interest that the patients who were most seriously ill were those in whom the lowest values for serum calcium were obtained Our series is too small to permit of com-

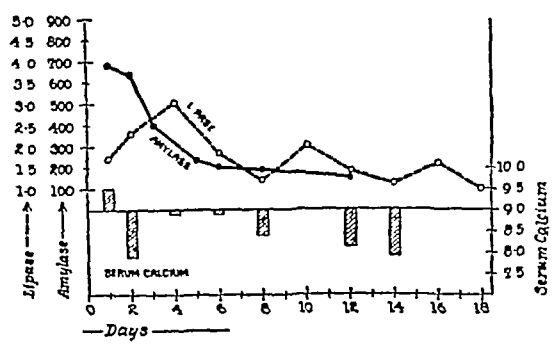

FIG 7 Composite curve of concentrations of serum amylase and lipase during the course of acute pancreatitis in eight patients The average mean blood calcium values in four cases are also shown The low calcium value in one patient on the second day probably represents a laboratory error

ment on the relative importance of hypocalcemia in prognosis in acute pancreatic disease By consulting Fig 7 it will be noted that the greatest depression in serum calcium concentration in these four patients occurred on the fourteenth day One determination in one patient on the second day of the disease showing a marked hypocalcemia is probably a laboratory error It will be noted that the serum calcium determination has little value in the early diagnosis of acute necrosis of the pancreas It is probable that marked hypocalcemia appearing on the fourth day or later adds support to the diagnosis of acute necrosis rather than that of a lesser degree of inflammation, as in so-called acute edema of the pancreas

Electrocardiographic Changes

Not infrequently, in the differential diagnosis of acute pancreatitis, coronary occlusion must be excluded One must also consider the concomitant occurrence of cardiac insult because of the associated shock and at times of a marked disturbance in electrolyte balance due to vomiting, dehydration, etc Obviously, these changes would be most marked in patients with antecedent cardiovascular disease In five patients with acute pancreatitis, Gottesman and his associates have recently reported the occurrence of electrocardiographic changes simulating those of coronary thrombosis [16,17] The abnormalities in the tracings were present when the patients were acutely ill and when the serum amylase was elevated With improvement in the clinical status of the patient and a return of the serum amylase concentration to normal, the electrocardiographic changes disappeared In their patients there was depression of the S-T segment in leads 2 and 3, and diphasic T waves were noted in leads 1, 2, and 3 Six days later, the T wave in lead 1 was inverted, and the T wave of lead 2 was diphasic, whereas fourteen days after the onset of the acute pancreatitis the tracings were normal

In three of our patients with acute pancreatitis, electrocardiographic changes were noted In case C B , four days after admission, the heart rate was 84, and PR interval 0 14 second The rhythm, P waves, and QRS complexes were normal The RS-T segments were iso-electric, the T waves were low in amplitude in L_2, CR_3, CR_4, and CR_5 and were inverted in CR_2 (Fig 8) This tracing was interpreted by our cardiologist, Doctor Samuel Bellet, as showing evidence of myocardial abnormality The electrocardiographic tracings, recorded four, seven, and eight days after the first tracing, were considered to be normal

In patient S S , two days following the acute attack, the electrocardiographic tracing revealed a rate of 75, PR interval of 0 19 second Rhythm

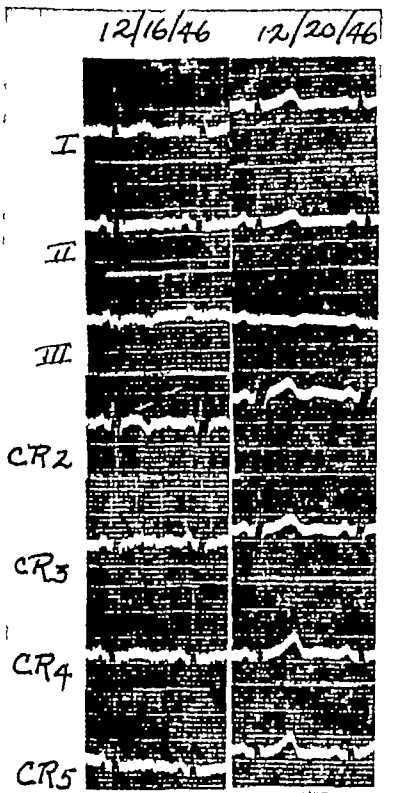

FIG 8. The tracing of C. B on December 12, 1946 showing evidence of myocardial abnormality was made three days after admission (see Fig. 5 for enzyme values) Four days later the tracing was essentially normal.

P waves, and QRS complexes were normal RST complexes were elevated in CR_3, CR_4 CR_5, low T waves in L_2 and L_3 and inverted T waves in L_1 CR_1, CR_2, and CR_5. These findings were interpreted as being indicative of advanced myocardial disease and suggestive of coronary artery involvement with possible recent myocardial infarction An electrocardiogram four days later showed normal RS-T complexes in all leads, low and upright T waves in L_1 L_2 L_3 CR_4, and CR_5.

Twenty two serial electrocardiographic tracings were performed on H F during the course of

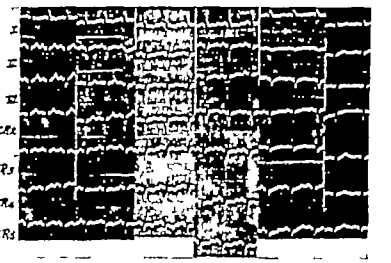

FIG 9 Acute severe pancreatic necrosis in case 11 F At the time of first tracing patient was in shock with a serum amylase value of 989 mg (Fig 2) Acute lateral coronary infarction was suspected. The abnormal findings improved but did not entirely disappear

eight weeks observation (Fig 9) In general, the interpretation of the tracings was that of acute lateral myocardial infarction The abnormal findings improved but did not completely disappear during this period It should be noted that the patient was extremely ill, being comatose for one week. Diabetes mellitus occurred during the course of the illness

As a result of the study of the electrocardiographic tracings in these three and in several other patients observed by Doctor Bellet, he has expressed the following opinion

'Profound changes occur in the electrocardiographic tracings in many patients with acute pancreatitis They include inversion of the T waves in lead 1 in the other limb leads, and in the precordial leads, accompanied by varying degrees of depression of the S-T segment These changes gradually return to normal with improvement in the clinical state of the patient These findings in conjunction with the clinical picture might be confused with the findings of acute myocardial infarction."

He expressed the opinion that the electrocardiographic changes in acute pancreatitis are to some extent the result of the shocklike state, particularly in older individuals with coronary arteriosclerosis. He likewise has considered the possible effect of a diminution in the concentration of serum potassium He believes that decreased serum potassium values could occur in association with acute pancreatitis particularly if vomiting or dehydration has accompanied the illness and if the patient is treated with large amounts of parenteral fluid and/or Wangensteen drainage.[18] He also mentioned that the loss of serum potassium may be increased in patients with concomitant diabetes mellitus since the administration of in-

sulin and glucose may still further diminish the concentration of serum potassium

We are of the opinion that the causes of the electrocardiographic changes occurring in association with acute pancreatitis have not been clearly established, but certainly the factors mentioned by Bellet should be given serious consideration We have presented the electrocardiographic examinations of these patients in some detail in order to emphasize the possibility of arriving at an erroneous diagnosis of acute coronary occlusion in patients with acute pancreatitis This mistake is not likely to occur if serum enzyme determinations are performed Unfortunately, coronary occlusion may occur in association with pancreatic necrosis, rendering the complete diagnosis very difficult

Treatment

Formerly, immediate operation was frequently employed in the treatment of acute pancreatic necrosis The mortality following immediate operation is something more than 50 per cent [19–21] In 1927 Schmieden and Sebening culled from the literature a total of 1,278 cases of acute pancreatitis treated by operation, resulting in a mortality of 51 2 per cent DeTakats and MacKenzie were apparently the first observers to question seriously the concept that acute pancreatitis was a surgical emergency [22] They observed that only eight of 22 patients with acute pancreatitis who were not operated on within the first twenty-four hours died (a mortality of 36 6 per cent) In 1934 Mikkelson reported 39 instances of acute pancreatitis, 20 of those patients were acutely ill and were treated conservatively in the acute stage of the disease [23] The mortality in this group was only 7 5 per cent It is now generally agreed that immediate operation is unwise, providing other acute "abdominal emergencies" can be excluded It is thought best to withhold operation during the acute stage of pancreatitis unless it becomes complicated by suppuration, severe hemorrhage, or spreading peritonitis After convalescence from the acute attack, if a severe complication has not developed, definitive biliary tract surgery is required in many patients Obviously, because of the peculiar physiologic activity of the pancreas, the need for a plan of medical treatment destined to curtail excessive pancreatic function is required Rowland devised such a plan [24] An outline of the principles of treatment employed in our patients follows

1 Relief of Pain—Aside from the unpleasantness of pain, it must be looked upon as definitely deleterious to the organism and certainly to the myocardium It has been pointed out by Popper and others that morphine should not be used because of its possible vagotonic action At any rate, in our experience it is a frequent cause of nausea and vomiting Demerol evidently has an atropine-like action and may be looked upon as the analgesic of choice Phenobarbital may likewise be given as needed Paravertebral block on the left side at the level of the eighth to tenth thoracic spinal processes has been used in several patients by Popper with good results We have had no experience with this method in acute pancreatitis but have employed it in the management of intractable pain in chronic relapsing pancreatitis

2 Treatment of Shock and Dehydration—Every effort should be made to overcome shock as quickly as possible by the administration of plasma and blood transfusions as required Because of the complete fasting which is recommended for these patients, sufficient parenteral fluid is required to maintain normal renal function and good electrolyte balance A word of caution is needed in the administration of glucose and insulin Diabetes mellitus accompanies acute pancreatic necrosis occasionally Glucose infusion must be given cautiously with frequent blood sugar determinations With the occurrence of hyperglycemia sufficient insulin is required with each glucose infusion Usually 5 to 10 units of regular insulin are given subcutaneously with each 25 Gm of glucose intravenously Even of greater importance is the necessity for avoiding insulin shock and hypoglycemia. The vagotonic action of hypoglycemia on pancreatic secretion may prove deleterious We have usually employed either 2 5 or 5 per cent glucose solutions, slowly infused, and have avoided the use of solutions of greater concentration.

3 Measures Adopted to Avoid Hormonal Stimulation of the Pancreas—When acute pancreatitis is suspected, a nasal tube should be introduced into the stomach at once and constant Wangensteen suction begun Care must be taken to maintain the position of the tube proximal to the pylorus in order to avoid the passage of gastric juice containing hydrochloric acid into the duodenum We have been in the habit of administering either soluble or insoluble alkalis every one or two hours during the period of Wangensteen suction If these measures are carried out meticulously, it is likely that the hormonal phase of pancreatic secretion may be suppressed

4 Measures to Avoid Nervous Stimulation of the Pancreas—Atropine sulfate in the dose of $1/75$ to $1/150$ grain every four hours is employed to depress vagal activity It is hoped that this may likewise tend to reduce the volume of gastric secretion Perhaps ephedrine may similarly assist in the inhibition of flow of pancreatic juice Obviously, drugs which stimulate the vagus nerves, such as prostigmine, which might conceiv-

ably be used to overcome distention, are to be withheld

5 Other Measures—Perhaps some thought should be given to the possible occurrence of hypocalcemia in patients who have suffered very acute attacks of pancreatitis Blood calcium determinations should be carried out, at least after the third day, and calcium gluconate administered parenterally if a calcium deficit is detected

The length of time in which the more rigid type of therapy is to be carried out depends upon the clinical status of the patient Recovery from shock, return of the temperature to normal a drop in the leukocyte count, and recedence in the physical evidences of inflammation constitute the most important guides It was necessary to continue the strict regimen for two weeks in patient H Γ and for only four days in patient S S

Our enthusiasm for the plan of treatment outlined above seems justified in view of recovery in 100 per cent of patients, an experience which was unheard of in the treatment of acute pancreatitis on our service previously It should be stated however that in only three of our patients was a diagnosis of acute severe massive necrosis of the pancreas entertained In three of the remainder it was thought that the inflammation was of lesser degree, and the lesions were classified as examples of acute edema. In the remaining four cases proof was finally obtained supporting a primary diagnosis of chronic interstitial pancreatitis, and *our treatment was carried out for a severe episode* of acute inflammation of the pancreas superimposed upon chronic interstitial pancreatitis

Summary

The diagnosis and treatment of acute pancreatitis constitute a problem with many facets This paper is not concerned with a detailed discussion of every phase of the problem A study has been made of ten instances of acute inflammation of the pancreas, consecutively diagnosed and treated during a period of fourteen months. As a result of this study the following items have been discussed (1) difficulties encountered in making a diagnosis at the bedside, (2) the significance of imbibing of alcohol and of gallbladder disease in the precipitation of the attacks, (3) the definitive value of blood serum enzyme determinations (4) experience with delayed hypocalcemia following the acute attack (5) electrocardiographic changes occurring in association with the acute pancreatic insult, and (6) an outline of treatment designed to splint the pancreas, based upon sound physiologic principles.

We should like to express our appreciation to Dr Samuel Bellet for his cooperation in the study and interpretation of the electrocardiographic changes in these cases.

FORRESTAL APPROVES INTEGRATION OF PANAMA CANAL ZONE HOSPITALS

Secretary of Defense James Forrestal has approved integration of National Military Establishment hospital and medical services in the Panama Canal Zone area, according to a news item which appears in the August 14 issue of the *J.A.M.A.*

Approval was given on recommendation of the committee on medical and hospital services of the armed forces of which Dr Paul R. Hawley, former chief medical officer of the Veterans Administration is chairman.

Under the integrated program hospitalization of the personnel of all three military services is assigned to the Navy on the Atlantic side of the zone and to the Army on the Pacific side.

STREPTOMYCIN IN TUBERCULOSIS EXPERIMENTAL OBSERVATIONS ON EFFICACY, SHORTCOMINGS, AND LIMITATIONS

WILLIAM H FELDMAN, D V M , D Sc , Rochester, Minnesota

(From the Division of Experimental Medicine, Mayo Foundation)

IN THE present phase of the development of specific drug treatment of tuberculosis, it might be profitable to examine first certain basic considerations of the problem of chemotherapy of this disease, second, the character of the evidence obtained by animal experimentation on which the clinical use of streptomycin has been based, and lastly, the present limitations or shortcomings of the clinical use of streptomycin

The Problem

The problem of successful chemotherapy of tuberculosis is especially difficult for reasons inherent in the nature of the disease First of these reasons is the essential pathologic character of infections produced by the tubercle bacillus The pathogenesis of tuberculosis differs markedly from that of many infections that have proved amenable to a chemotherapeutic attack. Tuberculosis is not a simple bacteremia or a localized acute or subacute infection Instead, it represents an elaborate immunologic and complex morbid reaction, which usually develops in a leisurely manner and may persist for years In the evolution of the process, proliferation and destruction of tissue frequently go hand in hand As older portions of the lesions necrose or soften, other portions may fibrose, heal, or calcify Retrogressive and progressive changes are frequently operative in the same patient In fact, it is common to find within a tiny focus signs of quiescence associated with signs of earliest activity and softening Cavitation and dense peripheral fibrotic encapsulation are characteristic in certain forms of the disease Such lesions are in marked contrast to the miliary lesions of hematogenous dissemination

The pathogenesis of tuberculosis can best be understood if it is recognized that this disease is protean in character As a matter of fact, the variability of the morbid conditions produced by the tubercle bacillus is so great that we may well question the correctness of referring to tuberculosis as a single disease This is illustrated by the dissimilarities of tuberculosis in different situations, such as the skin, the kidneys, the meninges, the endobronchial mucosa, and the bones, and the various forms of pulmonary tuberculosis The multiplicity of the morbid aspects of the disease and the inconsistent and complex character of the reactive process make the problem of arrest, healing, and cure of tuberculosis an exceedingly formidable one

Evidence of Streptomycin Effectiveness

The capacity of streptomycin to exert a deterrent effect on tuberculosis has been established by animal experimentation [1–3] Previous work with a long list of sulfones, particularly derivatives of 4,4′-diaminodiphenylsulfone, had demonstrated the vulnerability of the tubercle bacillus in vivo to the antagonistic action of specific chemicals Particularly, the results of the work with promin, diasone, and promizole left no doubt that tuberculous infections could be modified favorably by chemotherapy [4–7] It is true that the shortcomings of the sulfones in treating clinical tuberculosis were many and formidable, yet the application of these substances to the problem of a chemical attack on the tubercle bacillus was noteworthy After countless failures, it became evident that the disease produced by the tubercle bacillus could be attacked chemically with expectations of success

That streptomycin is a potent antituberculous substance became evident from the first (and inadequate) experiment that Hinshaw and I performed with this drug [1] Our first supply of streptomycin was received directly from Dr Waksman in the spring of 1944 The amount available was sufficient to treat only four tuberculous guinea pigs for a relatively short time The results indicated without question that in the presence of streptomycin fully virulent tubercle bacilli in the experimental animal were unable to express their usual pathogenicity Many additional experiments followed, the results of which demonstrated unequivocally the antituberculous potency of this antibiotic

The more important of the observations from our numerous animal experiments may be referred to briefly It was demonstrated repeatedly that, under the influence of streptomycin, tuberculous infections, established many weeks before treatment was started, were dramatically changed The disease lost its progressive momentum, the lesions became quiescent, retrogressed, or resolved Many animals in which the disease was widely disseminated when treatment was started were without gross or microscopic evidence of in-

Presented by invitation at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Medicine May 20 1948.

fection when treatment was discontinued [2] This was truly a dramatic and unprecedented demonstration of the ability of a drug to gain mastery over infections produced by tubercle bacilli The results with streptomycin were superior to those obtained previously with the sulfones. This fact coupled with the relatively low toxicity of streptomycin for animals, provided justification for its limited clinical trial [6]

Additional studies demonstrated that streptomycin was effective therapeutically against experimental infections induced by a considerable number of recently isolated human strains of tubercle bacilli and against tubercle bacilli of the bovine type [9] In previous experiments the infection had been established by a laboratory stock strain of tubercle bacilli (H37Rv) The results with the human and the bovine strains provided the clinician with additional confidence in the use of streptomycin in treatment of the naturally acquired disease

The most convincing evidence of the ability of streptomycin as an antituberculous agent was *revealed in an experiment in which the animals* were inoculated intravenously with an exceedingly large (1 mg) dose of tubercle bacilli [10] In this experiment the mean survival time of the untreated controls was approximately nineteen days This was in striking contrast to the results among the animals that received streptomycin, most of which, as a consequence of therapy, lived for many months

In this experiment a widely disseminated hematogenous infection was obtained almost immediately after inoculation. One may assume, therefore, that the character of the infection induced would offer profound difficulties for any known or hypothetic therapeutic substance It is true that the infection was suppressed, for the most part, and not eliminated as a consequence of streptomycin therapy This limitation of the effective range of streptomycin being recognised, the fact remains that even under conditions that were most formidable, the drug did modify favorably—in fact, dramatically—what was in the untreated controls a violent and rapidly fatal disease.

While additional data could be presented the experiments referred to indicated the capacity of streptomycin to reverse a highly malignant infectious process in an animal whose natural resistance to tuberculosis is of low degree The treated animals gained weight, they lived longer and had very little, if any, demonstrable parenchymal disease when treatment was discontinued

Morphologic Evidence of Therapy

In addition to the significant extension of life in the tuberculous animals as a result of streptomycin therapy and the fact that little if any tuberculous disease is demonstrable when the treated animals are observed at necropsy, another important criterion of antituberculous action should be considered. This is concerned with the ability of streptomycin to promote striking changes in the histologic characteristics of residual disease These changes connote healing and provide tangible evidence that, when the pathogenic activities of the infective agent are suppressed, the natural mechanism of healing and repair becomes effectively operative.

In animals treated adequately with streptomycin, the residual lesions are usually small, discrete structures with the features associated with regression or arrest of a tuberculous infection "Hard" or epithelioid tubercles may be found in the spleen and liver, less often in the lungs. The most frequent changes indicative of retrogression are fibrosis, hyalinization, and calcification of what one may assume were lesions previously progressive and potentially destructive Not infrequently after treatment with streptomycin, *residual lesions occur which have the structural* appearance of nonspecific granulomatous nodules with few if any recognizable features of tuberculosis.

Under natural conditions, when tuberculosis heals, alterations similar to those observed in streptomycin therapy also occur However, under natural conditions, in which the suppression of tubercle bacilli is dependent entirely on the intrinsic power of the host, the regressive histologic changes are relatively slow to evolve and frequently inadequate The principal value of an antagonistic agent effective in vivo against tubercle bacilli is the fact that the host is not dependent for the suppression of the bacterial population on the too often ineffectual mobilization of the natural antagonistic factors. An effective therapeutic substance creates a situation whereby the progression of the bacterial population continues with increasing difficulties, if at all. Consequently, there is created a threshold favorable for the healing mechanism to become effective within a relatively short period In tuberculosis this is the essential value of streptomycin

Limitations of Streptomycin*

Like every other substance of value in chemotherapy streptomycin *possesses certain short*comings or limitations. On a comparative basis the antibacterial efficacy of streptomycin against tubercle bacilli in vivo is amazingly high. However, from data obtained in our first animal

* Admirable discussions of the limitations and shortcomings of streptomycin as a therapeutic agent in certain forms of clinical tuberculosis have been contributed by McDermott Muschenheim, and their associates. [12]

experiment it was apparent that with this drug a complete bactericidal effect on tubercle bacilli in vivo would be difficult to achieve Many additional observations have confirmed this impression This was the first limitation of streptomycin as a therapeutic agent to be recognized

As mentioned previously, the antagonistic action of streptomycin against tubercle bacilli results largely in a suppression of the normal pathogenic activities of the organisms As a consequence of this suppressive action, the natural mechanisms of resistance and repair gain ascendancy over the factors of pathogenesis As a result, the disease may soon be converted from a progressive, destructive process to one that is arrested, with progression unlikely during the period of treatment This provides reason for the belief that by the intelligent use of this drug the time necessary for the arrest and stabilization of the tuberculous process and for the final rehabilitation of the tuberculous patient may be significantly shortened

Another limitation of streptomycin as an antibacterial agent in tuberculosis is that of drug resistance There are many aspects of the problem of streptomycin-resistant tubercle bacilli that are not well understood Until more information is available, it would be well to be circumspect in assessing the exact significance of this phenomenon Our present point of view may be summarized briefly as follows Before treatment with streptomycin the population of acid-fast bacilli in most patients is predominantly sensitive to streptomycin However, even before treatment with streptomycin there are in many patients a few tubercle bacilli that are more resistant than the vast majority of the bacterial population These resistant bacteria we regard as mutants or variants

As a consequence of the combined antagonistic action of streptomycin and the related activated mechanism of retardation on the part of the infected host, the streptomycin-sensitive bacteria are gradually rendered impotent and may even disappear Conversely, the suppression of streptomycin-sensitive bacteria is accomplished without a similar antibacterial action on the spontaneous variants which are resistant to the drug Since these latter strains are not amenable to the action of streptomycin, their persistence or eventual disappearance depends on the intrinsic ability of the infected tissues to mobilize factors of effective somatic opposition The resistant variants may persist for many months after cessation of treatment of the patient with streptomycin. In some instances they have eventually been replaced by tubercle bacilli predominantly sensitive to streptomycin When the population of tubercle bacilli is predominantly resistant to streptomycin by in vitro tests, further administration of the drug is unwarranted It has been shown experimentally in animals that infections due to streptomycin-resistant tubercle bacilli do not respond to treatment with this drug [13]

One should not, however, assume that, because the tubercle bacilli present at the end of the period of treatment are highly resistant to streptomycin, treatment has failed or that the disease will necessarily continue to progress There is no evidence that streptomycin-resistant strains of tubercle bacilli are more virulent than are strains highly sensitive to streptomycin Furthermore, my associate, Dr Hinshaw, has observed several cases in which severe progressive pulmonary tuberculosis continued to improve clinically after treatment had been stopped, this, in spite of the fact that tubercle bacilli markedly resistant to streptomycin predominated at the end of the treatment period In addition, in many of these cases the patients have eventually become bacteriologically negative for tubercle bacilli

If the use of streptomycin in treatment of tuberculosis is restricted to patients who, as experience has taught, will be most likely to benefit from this form of therapy, the problem of streptomycin-resistant tubercle bacilli will be reduced to one of minor importance

Unlike the treatment of many of the more acute infectious diseases, the successful treatment of tuberculosis involves a great deal more than the elimination or the suppression of the infective bacteria Unfortunately, in tuberculosis there usually exist alterations of tissue of varying degrees of severity These must be corrected by surgical measures or by the slower process of natural healing, repair, resolution, regression and calcification

It is illogical to assume that a chemotherapeutic substance can in some incredible manner cause the immediate and complete structural restoration of tissues irreversibly damaged or destroyed The rehabilitation of the injured tissues, once the infection has been subdued or eradicated, will depend largely on the individual constitutional capacity of the patient to restore that which has been damaged or destroyed Streptomycin or any other specific chemotherapeutic agent cannot properly be held responsible for failure to attain restoration of anatomic defects which characterize many tuberculous infections

The toxicity of streptomycin must be considered as another of the limitations of this substance as a specific agent in the treatment of clinical tuberculosis Like all other agents used in chemotherapy, streptomycin has certain toxic potentialities The most important of these toxic effects is a very unusual neurologic reaction manifested as vestibular dysfunction The occurrence

and severity of this reaction appear to be related to the size of the daily dose, the duration of streptomycin therapy, and, perhaps, to the interval of time between injections of the divided individual daily dose

Dr Hinshaw considers that a daily dose of 1 Gm. of streptomycin for six to eight weeks is usually well tolerated In patients receiving this amount of the drug, the symptoms of vestibular dysfunction are ordinarily mild or may be absent. Since this dose seems to be therapeutically effective in many forms of clinical tuberculosis, larger doses should be used only in exceptional circumstances

Experience indicates that, when streptomycin is used properly, its toxicity is sufficiently low to justify its use in situations that are serious or which may become so In infections that have a favorable prognosis under conventional forms of therapy, the drug should be used with great discretion if at all.

In recapitulation one may say that the shortcomings or limitations of streptomycin as a tuberculochemotherapeutic agent are essentially the same as those associated with the use of specific drugs, including present known antibiotics in the treatment of nontuberculous infections The effective range of all known antibacterial agents is definitely circumscribed, and none of the agents is able to replace or repair structural alterations or tissue damage existing as a consequence of the infection It is important that none of these drugs be used without proper regard for potential untoward effects.

A complete understanding of the bacteriologic and pathologic characteristics of the condition to be treated will assist in resolving much of the confusion that is sometimes apparent when the actual results of chemotherapy fall short of the unreal expectations frequently engendered when new agents are administered indiscriminately It is reasonable to assume that, as more information regarding streptomycin is obtained, the drug will be used more effectively and with fewer disappointments

Comment

In appraising the efficacy of any drug in the treatment of a tuberculous infection it is important to distinguish clearly between the antibacterial action against the tubercle bacillus and the structural alterations that represent the reaction of the body to infection by this organism.

The objective of the search for new drugs against tuberculosis should be an agent capable of preventing further progression of the disease by eliminating the infective agent. Only the natural reparative processes of the body can heal or repair the damaged tissues. However, a suitable antibacterial agent in treatment of tuberculosis can contribute importantly to the final arrest of the disease and healing of the injury by suppressing or by eliminating the infective bacteria. When tubercle bacilli are inactivated or destroyed, the natural processes of stabilization and of healing, which are notoriously slow in tuberculosis treated conventionally, may be markedly accelerated As mentioned previously, this appears to be the most likely explanation for the beneficent effects of streptomycin as an antituberculous agent.

Considering the relatively short time that has elapsed since streptomycin was first announced considerable information regarding certain aspects of this antibiotic has accumulated. The problem of its preparation in large quantities has been solved, its chemical structure has been revealed, and its therapeutic indications and contraindications are becoming better understood as are its limitations and toxic potential However, a great deal more remains to be discovered before this drug ceases to be of interest to the biologist the chemist, the pharmacologist, the bacteriologist, the pathologist, and others concerned with certain basic problems that streptomycin has propounded

The momentum acquired by the therapeutic assault on tuberculosis as a consequence of the clinical results with streptomycin prompts a word of caution in the future development of this field of therapeutics It can be predicted with considerable assurance that eventually other antituberculous drugs will be found that will be more effective than any known at the present time In the search for such new drugs let us not be impatient and bypass important basic experimentations Let us not subject patients prematurely to substances that may be entirely useless therapeutically and even potentially dangerous.

The initial clinical application of a new drug to determine its possible value as an antituberculous agent must be undertaken only when its relative safety and effectiveness against tubercle bacilli have been established by animal experimentations There is no acceptable substitute for this approach.

Lastly, we should be realistic in our expectations as to the attributes or essentials of the theoretically ideal chemotherapeutic substance. Even though a drug becomes available that is essentially nontoxic and is sufficiently antagonistic to tubercle bacilli to achieve a completely bactericidal effect within a few hours, the tuberculous patient will still require expert medical or surgical attention.

In other words, it is illogical to assume that treatment of the tuberculous patient will ever become the sole responsibility of the chemotherapist. Instead, experience has definitely shown

that the patient's best chance for recovery is provided when the conservative and intelligent use of chemotherapy is combined with modern medical and surgical procedures

Discussion

Howard Dayman, M D , *Buffalo* —It is a privilege to hear Dr Feldman present his observations on the antibiotic properties of streptomycin in tuberculosis, and I am sure that most clinicians would find their views generally in accord with those he has expressed Administration of the drug unmistakably favors resolution of exudative pulmonary lesions, particularly if it is used early, before extensive tissue necrosis has come about It has less effect on chronic productive lesions in the lung and, so far as we can determine, will very seldom cause closure of cavity At the Meyer Memorial Hospital, we give streptomycin quite regularly in the presence of acute pneumonic tuberculosis It is also used to shield the patient against extension of the disease during collapse therapy and in selected cases of tuberculous bronchitis, laryngitis, and enteritis We look upon it as a supplement to standard methods of treatment rather than an independent remedy

We are inclined to view the development of streptomycin resistance more seriously than Dr Feldman's remarks might imply Clinical effectiveness of the drug in man as well as animals depends on the presence of susceptible tubercle bacilli Organisms resistant to 10 or more units of streptomycin per cc have appeared in the body secretions as early as one month after starting treatment, but in one case of tuberculous meningitis in relapse the organisms were sensitive to streptomycin after eight months of drug therapy In most cases there would appear to be a time limit on the effective use of streptomycin This is unfortunate in a disease so prone to relapse as tuberculosis Even following a favorable response to streptomycin, the ultimate outlook may be grave if natural resistance is poor This has been demonstrated in susceptible animals which, despite continued use of the drug, succumb because the invading organisms are drug resistant

Clinically, our aim in using streptomycin has been to tide the patient over an acute phase of the disease, obtaining as much resolution as possible during the period of drug effectiveness It is hoped that the patient can thereby muster sufficient resistance to continue the healing process To further this end we have used collapse therapy concurrently in some cases, and in all instances have employed such supportive measures as would improve the patient's immunity With combined treatment of this sort the early response has been most gratifying, particularly in young people with acute disease It remains to be seen whether the response will continue In the final analysis, lasting recovery will probably depend on the degree of immunity which the patient develops This is as true now as it was before the use of streptomycin

It would be highly desirable if drug resistance could be circumvented In some cases drug resistance appears late Dr Feldman has remarked that in certain instances streptomycin-sensitive strains return in the secretions The view that a resistant variant to one drug may not be resistant to another drug suggests that the use of multiple drugs would be a logical step

Susan J Hadley, M D , *New York (By invitation)* —The fight against tuberculosis has, until recently, been largely confined to the field of preventive medicine and public health For years, workers, beginning with Robert Koch, have proposed and exploited many types of parenteral medications It was not until Dr Feldman and Dr Hinshaw first demonstrated the outstanding effectiveness of streptomycin on experimental tuberculosis in 1944 that real hope could be held for a curative agent Since then, their original, careful clinical and laboratory work has been repeatedly confirmed by others, and a bulk of statistical data has served to add further support We have just heard an excellent discussion of the present status and problems associated with the use of streptomycin in tuberculosis

Certainly, no one who has seen a single case of miliary tuberculosis respond to streptomycin can doubt the profound effect the antibiotic has on the disease In our group of patients at the New York Hospital we now have treated 20 cases of hematogenous tuberculosis, of which nine are alive and six completely well for a period which averages sixteen months since the end of therapy That we have not been completely successful in our treatment is not so important as the fact that we have reduced the case fatality from 100 per cent to 75 per cent on a long-term basis This figure compares well with the penicillin treatment of pneumococcal meningitis

The problem of the treatment of pulmonary tuberculous infections is a more common one Here, unfortunately, the nature of the disease restricts the success of treatment, as Dr Feldman has pointed out Although less than 5 per cent of patients will progress and at least 80 per cent will show symptomatic improvement under therapy, even short-term follow-up and, certainly, immediate laboratory evaluations are not as encouraging In our series of 60 patients who have been followed six months or more since the end of streptomycin treatment, almost 50 per cent who showed initial improvement had x-ray evidence of progression later Most of these exacerbations occurred within four months of the finish of therapy

More encouraging, however, is the fact that 50 per cent are completely well up to one and one-half years after streptomycin was discontinued To accomplish this, various types of ancillary therapy were employed I cannot stress enough the need for continued bed rest, despite what may seem to be unusual short-term improvement This should approximate the amount previously calculated before antimicrobial drugs were used Some of our most remarkable cases have eventually broken down because of unsupervised aftercare as a result of poor patient cooperation In addition, there is no doubt that streptomycin can be used to great advantage to prepare what would ordinarily have been hopeless patients for collapse therapy We have used thoracoplasty particularly to advantage

The chief disadvantage in treatment is the emer-

gence of resistant organisms. There are many unsolved aspects to this problem from an experimental point of view However certain facts are now known clinically which are of help First is that there is a fairly good correlation between in vitro and in vivo effectiveness. That the phenomenon of resistance is principally a time factor can be determined from certain of our statistics. Of a group of 27 patients treated with 3 Gm of streptomycin for one hundred twenty days, only two showed sensitive organisms at the end of treatment and for a period of follow-up as long as one year while with 12 patients treated with 3 Gm for only forty two days all but one showed the predominant organism to be sensitive up to four months With the dose of 1 Gm. a day for forty two days, which is now more commonly used, only 10 per cent were out of the therapeutic range after four months It is of interest however, to note that in a small group of eight patients who were treated for a second forty two-day period with 1 Gm., 50 per cent showed the emergence of resistant organisms by the end of treatment.

One more important factor in determining the length and amount of therapy is the toxicity of the drug We have encountered no important difficulties other than damage to the vestibular apparatus At first with the use of 3 Gm of the drug for forty two days or more, almost 100 per cent became dizzy and showed loss of response on caloric stimulation With 1 Gm., however only 13 per cent lost function Dr Tompsett in our department has determined that this 13 per cent fell into a group who received more than a total daily dose of 20 mg per Kg From this, a safer method of computing dosage becomes apparent. At present providing there is no serious kidney damage, no more than 20 mg per Kg per day should be used in long-term therapy

From the accumulated data, it is apparent that treatment can be short term only because of the early emergence of resistant strains of tubercle bacilli and must be limited in dosage to avoid vestibular damage. In addition, although remarkable results are possible the disease remains chronic and recurrent so that often for maximum benefit, collapse therapy and, certainly, bed rest are necessary to consolidate gains achieved

The early predictions made by Dr Feldman and his associates have served as a reliable foundation for the clinical studies which have been undertaken in the past two years. Although the complete answer to the successful treatment of tuberculosis has not been found streptomycin has been adequately demonstrated to be a valuable adjunct in therapy

STARVATION AND THE LIVER

Hepatic tissue and function are not always damaged by malnutrition, as shown by 21 German citizens, 6 to 46 per cent underweight, who had eaten low-protein diets for more than a year Biopsy revealed no fatty degeneration, cirrhosis, or necrosis Drs. Sheila Sherlock and Veryan Walshe of the Postgraduate Medical School of London England observed low blood volume, hemoglobin, serum protein and cholesterol, and fecal urobilinogen. Hippuric acid synthesis, bromsulfalein excretion, glucose and adrenalin tolerance, Insulin sensitivity hepatic glycogen serum bilirubin, and alkaline phosphatase of liver and serum were unaffected. Liver cells contained much iron.—*Modern Medicine, July 15 1948*

ALTITUDE DOES NOT INJURE HEART

Contrary to widespread belief, living at an altitude as high as 8 000 feet is not injurious to the heart, says Gonzalo Esguerra Gomez M.D., of Bogota, Colombia.

Writing in the August 7 issue of the *Journal of the American Medical Association* Dr Gomez bases his conclusion on a study of 480 residents of Bogota, which is 8,016 feet above sea level. In none of these residents did he find enlargement of the heart out of proportion to the general build, or abnormal variations in blood pressure pulse, respiration or number of red blood cells.

Prolonged strenuous exercise can cause enlargement of the heart, he says but no more so at 8 000 feet than at sea level.

RICKETTSIALPOX

HARRY M ROSE, M D , New York City

(From the Departments of Medicine and Bacteriology, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital)

RICKETTSIALPOX is the denomination of a disease entity which was first recognized in 1946 and, up to the present time, has not been observed outside the metropolitan area of New York City Huebner and others identified the causative agent as a new species of rickettsia, Rickettsia akari, and showed that the infection is, in all likelihood, transmitted to man by the bite of a blood-sucking insect, a rodent mite, Allodermanyssus sanguineus [1 2] These same investigators isolated R akari from mice trapped in apartment houses where cases of rickettsialpox had occurred, and there is no doubt that the common house mouse, *Mus musculus*, is a reservoir of the infection [3] The clinical features of rickettsialpox were first reported by Sussman, Shankman, and later in an extended series of cases by Greenberg and his collaborators [4–7] The illness is usually characterized, at its onset, by the appearance of a primary cutaneous lesion which develops at the point of the insect's bite This is followed about a week later by fever, chills, headache and malaise, and a generalized skin eruption that may simulate the rash of chickenpox Although the patient may be severely ill for several days, the disease is benign, and no fatalities have been reported

Rickettsialpox is now of common occurrence in all parts of New York City, except Staten Island More than 350 cases have been formally reported to the Department of Health since the spring of 1946, and many others have probably passed unrecognized, especially those of mild or atypical character [8] During the past year, since April, 1947, we have observed 21 cases of rickettsialpox at the Columbia-Presbyterian Medical Center, of which 17 were hospitalized and studied closely These cases furnish the basis for the present communication, which deals with the clinical manifestations of the disease, the methods employed for specific serologic diagnosis, and the technics used to isolate the responsible agent

Case Reports

Three cases which illustrate important features of the disease, are reported in brief detail

Case 1 —The patient was a 40-year-old white man, a painter, who entered the hospital on July 25, 1947 The past history was irrelevant, except that he had received typhus vaccine while in the Army in 1944 Three days before admission the patient noticed a lesion on his back, just below the right scapula, which he thought was a boil There were no symptoms at this time On the day of admission he awoke with headache and a feeling of feverishness He took his temperature and found it to be 103 F He had chilly sensations but no shaking chill He also noted that he ached all over and that his throat was slightly sore

On admission to the hospital, his temperature was 105 F Physical examination revealed a lesion just below the right scapula consisting of an area of erythema and induration about 1 5 cm in diameter with a central dark eschar The leukocyte count was 6,500 with polymorphonuclears 81 per cent, lymphocytes 7 per cent, monocytes 5 per cent, basophils 1 per cent There were no other findings of importance at this time

The following day the patient continued to have malaise and headache, and the temperature was 103 2 F Enlargement of the right posterior cervical and supraclavicular nodes had now developed, and a rash on the trunk was observed for the first time, consisting of erythematous macules, many of which had central vesicles These were described as having a varicelliform appearance

During the next forty-eight hours the temperature fluctuated between 103 and 104 F The rash persisted, but no new cutaneous lesions made their appearance Throughout the febrile period there was a marked relative bradycardia Additional laboratory findings showed urinalysis, negative, blood culture, sterile, chest x-ray, no abnormal findings, Weil-Felix test negative with Proteus OX19 and OXK The patient's skin eruption and fever disappeared rapidly after the fifth hospital day, and at the time of discharge he was without symptoms

We were unable to determine where the patient contracted his disease In his occupation as a painter it is possible that the exposure might have occurred in his place of work However, it is of interest that at least four adults who lived in his apartment house had recently been ill with what was called "chickenpox"

A specimen of blood taken on the seventh day of the patient's illness gave a negative complement fixation test with rickettsialpox antigen The test was positive in a serum dilution of 1 32 on a specimen of blood obtained seven weeks later

Case 2 —The patient was a 33-year-old Negro woman, a domestic, who entered the hospital on June 19, 1947 The past history was irrelevant

SIX days before admission the patient noticed a papule near the left angle of her mouth, together with some swelling of a lymph node beneath her

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Medicine May 21, 1948

On the following day the papule became er and a vesicle appeared in its center The mental node became painful Two days before ission she developed a headache felt feverish found her temperature to be 102 F On the owing day a rash appeared generally distributed r the body and she had two shaking chills On ission to the hospital she did not appear acutely

Physical examination revealed a crusted lesion ut 1 cm in diameter at the left angle of the uth. Scattered over the trunk, extremities and was a maculopapular eruption and many of the ons exhibited a central area of vesiculation Be- th the chin there was a firm tender node about 2 . in diameter

The rest of the examination was essentially nega- e. The leukocyte count was 2,500 with poly- rphonuclears 54 per cent lymphocytes 40 per it, monocytes 5 per cent, basophils 1 per cent. r the first twenty four hours the temperature led between 101 and 102 F but during the next o days it fell to normal, and the rash rapidly led. Additional laboratory examinations were follows urinalysis negative blood culture, rile, chest x ray, no abnormal findings sheep l agglutination test positive in a serum dilution of 8 Weil-Felix test negative with Proteus OX19 d OXK.

The source of this patient s infection was not de- mined but was probably in the home. She had ted that her apartment was infested with mice ie did however in the course of her work as a mestic, make frequent trips to downtown Man- ttan and to the Bronx. There is no history of her countering mice in the homes of any of her em- oyers.

The rickettsialpox complement fixation test on a mple of blood collected on the seventh day of the ness was negative. The test was positive in a rum dilution of 1 64 with a specimen of blood ken seven weeks later

Case 3—The patient was a 56-year-old white oman a housewife who was admitted to the hos- ital on July 20 1947 The past history was irrele- ant.

About ten days before admission the patient be- an to note chilly sensations and to have frequent veats accompanied by a low-grade fever ranging om 100 to 101 F At the same time she had moder te malaise and a little frontal headache. Three ays before admission she had a shaking chill and her emperature rose to 104 F The headache became ery severe Two days before entry a rash appeared ver the trunk and extremities but was particularly oticeable over the chest and abdomen At the ime of admission the temperature was 103 6 F The patient appeared moderately ill and com- lained of severe frontal headache.

Scattered over the back chest abdomen and ex remities were numerous papulovesicular lesions about 0.5 cm. in diameter One lesion was seen on the left side of the palate. There was no lymph adenopathy A questionable primary lesion was present on the left lower leg The remainder of the physical examination was essentially negative. The leukocyte count was 2 800 with polymorphonuclears 58 per cent and lymphocytes 32 per cent. Eleven abnormal lymphocytes suggesting those seen in in- fectious mononucleosis were observed in the blood smear

On the following day the rash had increased. It was now observed over the legs arms body and scalp with several lesions on the palate The leuko- cyte count was 2 900 with polymorphonuclears 76 per cent and lymphocytes 24 per cent. The lymph ocytes in this smear were described as normal. The patient continued to run a fever for the first four days during which time she had moderate malaise headache and frequent chilly sensations By the fifth day however the temperature had declined to normal and the rash was fading Additional labora tory examinations gave the following results urin alysis negative blood culture sterile, chest x-ray negative sheep cell agglutinins positive in a serum dilution of 1 16 Weil Felix test negative with Proteus OX19 and OXK. At the time of discharge the patient was completely free of symptoms.

We have no definite idea where the patient may have contracted the infection She was a house- wife and it must be presumed that the infection was acquired in her home although she had not observed mice on the premises.

The rickettsialpox complement fixation test on the eleventh day of the disease was negative but it was positive in a serum dilution of 1 32 four weeks later

Clinical Manifestations

Most of the outstanding clinical and laboratory features of rickettsialpox are represented by the three cases just described The over-all findings in the series of 17 hospitalized patients will now be presented. The oldest of the patients was fifty six years of age, and the youngest was two years of age Eleven were men, and ten were women

Initial Lesion—In 15 of the 17 patients a pri- mary lesion could be identified with certainty These consisted of areas of erythema and indura tion from 1 0 to 2 5 cm. in diameter In two early primary lesions there was a large, central vesicle containing cloudy fluid In the others, however, the site of the original vesicle was represented by a central dark brown or blackish, crusted area, simulating closely the initial eschar that is seen in cases of tsutsugamushi disease or fievre boutonneuse The primary lesion was never tender or painful and in several cases had not been previ ously recognized by the patient.

Eight patients had single lesions on either the arms or legs In four others the primary lesions were seen near the left angle of the mouth at the base of the neck in the right anterior cervical area, on the neck in the left suboccipital area, and on the back below the right scapula. The remaining three patients were of interest in that two primary lesions were seen In one of these cases the lesions were on the forehead and abdomen in the second

on the forehead and the left leg, and in the third they were situated close together on the anterior aspect of the right thigh In practically every instance the lymph nodes draining the area or areas where the primaries were situated were enlarged and slightly tender In several instances the magnitude of the lymphadenopathy was striking, but there was never any evidence of lymphangitis

Cutaneous Eruption—In the majority of the cases the rash appeared within six days after the onset of the febrile period of the disease In one patient, however, an interval of nine days elapsed between the development of fever and the first appearance of the cutaneous eruption The individual lesions varied considerably in their appearance but usually consisted of erythematous maculopapular lesions ranging from 2 or 3 mm up to as much as 8 mm in diameter They were discrete and generally distributed over the body surface, including the face, and in three cases they were observed on the palms and soles In one individual the rash was so faint as to be almost inapparent In another patient the eruption was indistinguishable from that seen in murine typhus

The chief feature of the individual lesion in most cases, however, was the development of vesiculation In some instances this amounted to no more than a small, pinpoint, opaque area containing a little cloudy fluid at the summit of the papule In others the vesiculation was more outstanding, constituted the majority of the papule, and was surrounded by a narrow band of erythema These latter vesicles were individually difficult to distinguish from those seen in chickenpox The eruption was never pruritic, nor did it cause the patient any form of discomfort Following the disappearance of the eruption a few spots of brownish pigmentation remained, but no residual scarring was ever noticed

In five of the 17 cases an enanthem was present, the lesions on the buccal mucous membrane resembling those on the body surface The enanthem was present for less than forty-eight hours in three patients and, therefore, may be missed unless carefully searched for at daily intervals

Symptoms and Physical Signs—The constitutional symptoms were represented chiefly by fever, headache, chills or chilly sensations, and backache or general muscular aching These symptoms appeared from two to seven days after the appearance of the primary lesion Fever was present in every case, and the maximum temperatures ranged from as low as 101 F to as high as 105 6 F The fever curve was of the remittent type and fell to normal by lysis, generally within a week Headache was a very prominent feature and was usually frontal, although in two cases it was chiefly occipital Complaints of chilliness were made by nearly all patients, and nine of the 17 patients had frank, shaking chills with drenching sweats Backache and general muscular aching were quite severe, approximating that seen in cases of influenza Other symptoms occasionally noted were pain and stiffness of the neck, photophobia, nausea and vomiting, cough, and sore throat

Other than the presence of the primary lesion and the skin eruption there was ordinarily little to be discovered on physical examination Although the regional lymph nodes draining the area of the primary lesion were usually enlarged, a generalized lymphadenopathy was observed in only two cases The spleen was palpable at the height of the disease in three patients, and a mild conjunctivitis appeared in three others Examination of the cardiovascular system was not remarkable, and there were no abnormal physical findings in the lungs

Laboratory Findings

Routine laboratory examinations failed to reveal anything noteworthy with the exception of the leukocyte and differential counts Nearly all the patients showed a moderate or a marked leukopenia during the acute phase of the illness, and ten of the cases showed initial counts ranging between 2,500 and 4,500 cells per cubic millimeter, while only three had counts in excess of 7,000 In twelve of the patients the differential count was normal, and no abnormal cells were seen on the smear In five individuals, however, the smears showed a number of abnormal leukocytes—large mononuclear cells with vacuolated cytoplasm—resembling the peculiar cells that are customarily observed in the blood of patients with infectious mononucleosis Indeed, three of these five patients were admitted to the hospital with an original diagnosis of infectious mononucleosis It should be noted that these abnormal lymphocytes did not tend to persist in the blood and were present for only a day or two Tests for heterophile antibody never showed a significant titer of sheep cell agglutinins, either during the acute illness or in convalescence

Weil-Felix agglutination tests with Proteus OX19 and OXK were done with the acute and convalescent phase sera of 13 patients Although low agglutinin titers were occasionally observed in some cases, in no instance was a positive result obtained

Specific Serologic Diagnosis

During recent years serologic methods have been developed for the precise diagnosis of rickettsial infections The method most widely employed at present is the complement fixation test,

using antigens prepared from rickettsiae cultivated in the yolk sac of developing chick embryos. The principle involved is to perform such tests on serum obtained during the acute phase of the patient's illness and again during convalescence, usually from two to six weeks later. The detection of a significant rise in rickettsial antibody in the convalescent serum determines the temporal relationship of the immune response to the disease and thereby enables a retrospective diagnosis to be made. Short of actually recovering and identifying the causative agent, specific serologic reactions offer the only means for the exact diagnosis of infections caused by viruses and rickettsiae.

Blood specimens were obtained from all the patients during the acute phase of the illness and again during convalescence, from two to seven weeks later. The paired serums were tested by the complement fixation technic with antigens prepared from R. akari grown in chick embryos and also with similar antigens prepared from the rickettsiae of murine typhus and Rocky Mountain spotted fever.* In every case these tests revealed the development of specific antibody (Table 1) and thereby confirmed the clinical diagnosis. It is of interest that a considerable degree of cross reaction was observed in most cases with the rickettsialpox and spotted fever antigens, indicating a close antigenic relationship between R. akari and R. rickettsii. In addition, minor cross reactions were frequently observed with R. mooseri, the agent of murine typhus. These serologic relationships require further study.

Isolation of the Causative Agent

Attempts were made in nine patients to recover the causative agent by inoculating blood collected early in the disease into mice, guinea pigs, and chick embryos. From seven of the patients R. akari was successfully isolated by mouse inoculation and from one of these patients the organism was also cultivated directly in chick embryos. In our experience the easiest and most certain method of isolation is to inoculate a group of eight or ten adult Swiss mice intraperitoneally each with 0.5 cc. of fresh citrated or defibrinated venous blood obtained as early in the febrile period of the disease as possible. Dilute brown agouti mice may be used as well as Swiss mice and appear to be about equally susceptible. If animals are not immediately available, the blood may be frozen and stored in solid carbon dioxide. We have isolated rickettsiae from such frozen specimens at intervals up to six months after storage.

Following inoculation, the animals rarely die in this first passage, but they often appear ill during the second week, exhibiting lassitude, ruffled fur, and labored breathing. Regardless of their external appearance the mice are sacrificed from seven to ten days after inoculation and examined for inguinal and axillary lymph adenopathy, splenic and hepatic hypertrophy and congestion and increased amounts of peritoneal fluid. Any or all these signs may denote infection, and rickettsiae can usually be easily demonstrated in smears of the liver, spleen, and peritoneal fluid stained by the Macchiavello method. Subsequent passage of suspensions of infected liver and spleen intraperitoneally into fresh mice usually results in a fatal illness, the animals dying five to nine days after infection with typical findings at autopsy.

From infected mice on the first or later passages, rickettsiae may be readily transferred to chick embryos. Suspensions of liver and spleen are inoculated into the yolk sacs of seven-day-old embryos which are incubated at 35° C. The embryos die four to nine days later, depending on the size of the inoculum, and numerous rickettsiae may be demonstrated in smears of the yolk sac stained by the Macchiavello method. Once established, the organisms may be maintained indefinitely in chick embryos by serial passage.

Differential Diagnosis

Rickettsialpox has been most frequently confused with chickenpox and in some cases especially in children the differential diagnosis may

* The murine typhus and spotted fever rickettsial antigens were generously supplied by Dr. Herald R. Cox, director Section of Viral and Rickettsial Research, Lederle Laboratories, Pearl River, New York.

not be easy The most important points are the presence of a primary lesion and the fact that the exanthem develops as a single crop of cutaneous lesions, whereas in chickenpox the eruption appears as successive crops of vesicles

In early cases of rickettsialpox, before the rash appears and when atypical mononuclear cells are present in the blood smear, infectious mononucleosis may be suspected The brief persistence of these cells, the negative heterophile agglutinin test, and the ultimate appearance of the rash are helpful differential criteria

Other rickettsial infections to be distinguished are murine typhus and Rocky Mountain spotted fever In neither is there a primary lesion, the rash is never vesicular, and in both the Weil-Felix test with Proteus OX19 is usually positive It should be pointed out, however, that one of our cases of rickettsialpox had no detectable primary lesion and exhibited a nonvesicular rash indistinguishable from that seen in murine typhus The Weil-Felix test was negative, however, and the complement fixation test was positive in convalescence with rickettsialpox antigen

In the last analysis, the definitive diagnosis of rickettsialpox rests on the demonstration of the specific immune response or the recovery of the causative agent

Treatment

Since rickettsialpox is a nonfatal disease, the only form of therapy required is for the relief of symptoms Certain antibiotics, including streptomycin and chloromycetin have been shown to exercise a rickettsiostatic effect in chick embryos and experimental animals [9 10] We have treated one case of rickettsialpox with streptomycin in a patient who acquired the infection in the laboratory The drug was started immediately upon the appearance of symptoms but, in doses of 2 0 Gm. every twenty-four hours, did not appear to modify the disease

Summary

Rickettsialpox is apparently a new disease as yet confined to New York City The clinical and laboratory features of the infection have been discussed, together with means for specific serologic diagnosis and recovery of the causative agent, Rickettsia akari

Discussion

John K Miller, M D , *Albany* —Since rickettsialpox is the most recently recognized member of the group of arthropod-transmitted diseases incited by rickettsiae, it is of interest to determine its present place in the epidemiologic scheme of these diseases

In the "typical epidemic series," Baker conceives of arthropod-borne diseases as originating in an arthropod, developing in a series of steps which eventually reach their climax in epidemic form and then regressing to possible extinction [1] According to Burnet, the first stage is probably a colonization of the arthropod gut by saprophytic agents, some of which exploit their opportunities and begin to derive their nutriment from the living cells rather than from the content of the gut [2] The agent then comes to equilibrium with the host and lives as a symbiont (Class 1) The potential pathogenicity of the agent, however, is maintained and can be activated if it comes into association with the living cells of another organism, which may occur when the arthropod obtains a blood meal Thus the disease in animals, Class 2 in the series, is accomplished An example is the rat flea with its host in murine typhus The disease may be almost or entirely subclinical in the rat host and the rickettsial infection harmless to the arthropod

The third step (Class 3) is the establishment of the human endemic disease, as in endemic typhus Man is usually an accidental host of arthropods A reservoir of the disease is maintained by passage back and forth between the vector and its lower mammalian host, or if the agent is hereditarily transmitted by the arthropod, the vector alone is all that is necessary for a reservoir

When the etiologic agent involves a new host, arthropods other than the original may become transmitters In the case of typhus fever, Baker conceives of the flea as the primary vector and the rat as the primary host When man becomes a secondary host, an arthropod closely associated with him, the louse, becomes the secondary vector Thus Class 4 is reached With the appearance of a secondary vector, the primary vector and host, i e , flea and rat, may drop out of the cycle, and the disease is characterized by a specialized reversible transmission between the secondary host-vector combination, such as man and his lice This constitutes the classic epidemic typhus (Class 5), in contrast to the endemic form in which the main interchange of rickettsiae is between flea and rat, with man being sporadically infected by the flea In the secondary arthropod vector, the biologic equilibrium obtained between the primary vector and the pathogenic agent may not be attained For example, by long transfer from man to louse to man, the classic strain in Europe loses its tendency to follow the rat-flea cycle, and the man-louse cycle operates alone The rickettsiae, however, overwhelm the louse, which dies in about ten days Thus, Baker believes that the secondary arthropod may disappear from the cycle, leaving the disease lying dormant in a human reservoir in which late but mild recrudescences may occur such as Brill's disease (Class 6) [3]

In Class 4 the cycle may become very complex, as in Australian Q fever contracted in abattoirs The rickettsiae in their natural vector, Haemaphysalis humerosa, are transmitted to the bandicoot host carrying also the tick Ixodes holocyclus This latter arthropod transmits the etiologic agent to cattle, which are also infested with a third arthropod, Boophilus annulatus It is the rickettsiae-infected feces of the Boophilus tick which contaminate the dust in the hides, which is the source of human infections

Where is rickettsialpox in this scheme? At present it seems to be in Class 3. The primary arthropod is the mouse mite the primary host, the mouse and man is accidentally the secondary host through association with the mice Further study may reveal secondary arthropod vectors. If such vectors for example the louse are closely associated with man, the disease may move into subsequent stages of the epidemic cycle

RADIO-ISOTOPES CANCER AID

Exploding atoms are among science s greatest hopes today in the fight against cancer Just as radium and the surgeon s knife can be used to destroy some malignant tissue that is cancer, so radioactive elements resulting from the processes of the atomic bomb can be used to wipe out some malig nant growths.

Iodine, gold, and cobalt in radioactive forms are the most promising of the potential anticancer radioisotopes.

No scientist would be foolhardy enough—or cruel enough to cancer victims—to hold out too much hope in individual cases Nevertheless, the years of human life to be saved by future applications of radio-isotopes promise to compensate many times over the loss of human life due to use of the atomic bomb in warfare—if the world can arrange not to use the atomic bomb as a weapon in the future.

When the cancer is in the thyroid gland, radioiodine is used as a means of diagnosis and often as treatment. The thyroid gland picks up and utilizes nearly all of the iodine in the human system nor mally about 80 times as much as any other tissue.

When the uranium atom splits up—fission, it is called—as it does in the atomic bomb and in the more peaceful chainreacting uranium pile, one of the many elements formed is a special kind of iodine with a weight 131 times the mass of the hydrogen atom This special fission-made iodine gives off powerful gamma rays, like radium does It can therefore destroy human tissue if it can get at it. Since it is attracted to thyroid tissue, it can be used to destroy it, whether or not it is diseased. Separate out this particular kind of iodine from all the many products of uranium fission as the Atomic Energy Commission does at Oak Ridge Tennessee feed it to the patient and the radio-iodine will go to the thyroid and do its work. Fortunately, this kind of radio-iodine is relatively short-lived, half of it losing its activity in eight days. So it is relatively safe to use since it will not go on with its lethal bombardments when they are no longer needed.

For treating overactive thyroid glands a condition known as toxic goiter, radio-iodine has been very successful. The Mayo Clinic reports success in 80 per cent of the cases treated. Radio-iodine also helps to diagnose the disordered thyroid, whether it is overactive, underactive or cancerous. It is also used as a tracer to locate the deposits of thyroid cancer tissue in various parts of the body far removed from the parent growth—metastases they are called.

The results of treatment of thyroid cancer with radio-iodine have not been nearly so satisfying as the treatment of toxic goiter The latest report of the Atomic Energy Commission explains that malig nant thyroid tissue often does not pick up as much of the radioactive iodine as does the normal thyroid tissue. Much research is underway some of it very promising particularly attempts to put the radioiodine in organic compounds that will be selectively absorbed by cancerous tissues

At the Sloan-Kettering Institute for Cancer Research in New York, animal experiments are testing whether natural antibodies can be made to carry radio-iodine to special parts of the body such as the liver and kidney, there to administer strong doses of radioactivity

The metal cobalt when irradiated in the Oak Ridge pile omits radiations similar to those of radium Since it can be made inexpensively and fabricated into special applicators it will come into general use for cancer treatment when handling and dosage are worked out.

The radioactive form of phosphorus is being used to treat leukemia a cancerous condition of an excess of white corpuscles in the blood and results are as effective as x-ray therapy without causing uncomfortable radiation sickness. This use is based upon the fact that phosphorus concentrates in the blood producing centers.

Treatment of cancer by radio-isotopes is still in its early stages Much more must be learned about basic bodily processes generally and specifically what molecules concentrate in diseased body tissues and can therefore carry to them the exploding atoms that can blast out the disease.

Science has had ample supplies of radio-isotopes for only a short time as scientific progress goes. The first shipment of a radio-isotope was made from Oak Ridge just two years ago (August 2) and it was radiocarbon 14, a substance that Massachusetts General Hospital research hints may be absorbed rapidly by diseased tissue when it is incorporated in protein compounds.—*Science News Letter August 14, 1948*

AN EVALUATION OF THE PRESENT STATUS OF ANTIHISTAMINIC SUBSTANCES

W C Spain, M D , and F A Pflum, M D , New York City

(From the Allergy Division, Department of Medicine, New York Post-Graduate Medical School and Hospital)

THE phenomenon of anaphylactic hypersensitiveness was recognized first about a century ago [1] It was not until some fifty years later, however, that investigators became curious and actually interested in the condition as a result, largely, of the observations of Portier and Richet, Arthus, von Pirquet and Schick, Otto, and of Rosenau and Anderson [2–6] In his search for that protein poison, which was generally hypothesized as being responsible for the condition, Dale noted in 1912 that the specific reaction of sensitized muscle to its antigen was identical in every respect to the effect produced by exposure of nonsensitized muscle to histamine, a substance which had been known for some time but which was only isolated from ergot by Barger and Dale in 1911 [7–9] Histamine, an amine of relatively simple form, has since been the subject of intensive study [10] Best, Dale, Dudley, and Thorpe showed that various normal tissues contained loosely combined histamine and that there was a sufficient amount in unstriped muscle to cause a typical anaphylactic contraction in that muscle upon its liberation [11 12] Code has demonstrated that most of the normal blood histamine is in the white cells, while he and Dragstedt and Gebauer-Fuelnegg have shown that a histamine-like substance is present in the blood of the lower animal during anaphylaxis [13,14] From these observations and those of very many others, it seems certain that histamine is closely linked with the phenomena of sensitization in the lower animal and plays an important role in anaphylaxis

In 1927 Lewis and his coworkers focused attention sharply upon the importance of histamine in the human [15] These investigators were able to show that the wheal experimentally produced in the human skin following cell injury was due to the liberation of a loosely combined substance which could not be differentiated from histamine According to the theory of Lewis, the union of antigen and antibody in sensitized tissues causes the liberation of the histamine normally present there, and that, through tissue injury, the histamine thus released produces phenomena characteristic of the allergic reaction or of anaphylactic shock

The opinion favoring the idea that histamine is an important agent in the allergic conditions of man rests largely on the theories and findings of Lewis and his associates Actually, the evidence is circumstantial The literature on the subject is conflicting and confusing It ranges from reports upon the efficacy of histamine itself as a therapeutic agent to the description of sundry attempts to identify it as important or vital to the hypersensitive reaction in man Despite these efforts, it is the data upon the linkage of histamine with anaphylaxis, rather than the data on any proved linkage with allergy in man, that has led to the development and to the application of antihistaminic therapy as a countermeasure in human sensitization Such therapeutic measures against histamine have developed along the following lines

1 Attempts have been made to increase the individual's tolerance to histamine by subjecting him to repeated, increasing doses, usually administered by hypodermic injection, of histamine itself, a weak antigen, or of histamine linked with a protein such as casein or serum globulin of the horse or cow [16] Such histamine-azoprotein has been regarded as having an antigenic potency greater than that of histamine [17]

2 Clinical use has been made of an antihistamine enzyme, histaminase, whose behavior in the test tube encouraged the idea that it would prove effective in neutralizing histamine in the body [18–21]

3 The clinical use of synthetic chemical compounds or antihistaminic substances which have been shown to prevent anaphylactic activity in the lower animal by rendering the histamine ineffective, displacing (or replacing) it at its site of reaction

The efforts at improving allergic symptoms by increasing histamine tolerance by injections of histamine itself or histamine-azoprotein in series have not been very successful, while the attempts to destroy or alter histamine by the administration of the enzyme, histaminase, have been discouraging [22–28] Indeed the American Medical Association, through its Council on Pharmacy and Chemistry, stated in 1940 that histaminase possessed too little clinical value to warrant inclusion in the "New and Nonofficial Remedies" [29]

More successful has been the effect of the

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City, Section on Medicine, May 21 1948

oral administration of antihistaminic substances which have the characteristic competitive effect of displacing or replacing histamine by attachment to the cell receptor Earlier known compounds with antihistaminic effect were ineffective or toxic These were the amino acids, arginine histidine, cysteine, and the phenolic ethers [20] The preparations used at present, characterized by an ethylene-diamine radical, have the following features

1 They act as counter agents against histamine in several principal ways

(*a*) They will protect the normal guinea pig against lethal shock which would otherwise follow the injection of histamine

(*b*) They will protect the anaphylactic guinea pig against lethal shock which would otherwise follow the injection of the specific antigen

(*c*) They will diminish the activity of wheal production from histamine peptone, morphine, and atropine in normal human skin [21]

(*d*) They will diminish the activity of wheal production on introduction of the specific allergenic substance in allergic human skin.

(*e*) They will often reduce the swelling and congestion in many allergic disorders, such as nasal edema in hayfever, bronchial edema in asthma, and cutaneous and subcutaneous edema in urticaria.

2 They often have a local anesthetic effect.[21,22]

3 They are relatively nontoxic but frequently do produce symptoms of drowsiness lassitude, nervousness, and insomnia even in small doses

Among the antihistaminic drugs which have been most intensively studied are Benadryl (Parke Davis & Co), Pyribenzamine (Ciba) Neo-Antergan (Merck) Hydryllin (Searle), and Trimeton (Schering) *

Clinical Value

Obviously, any prompt clinical evaluation of a new drug on a large scale is most difficult. The differences in the investigational methods of various workers, the presence or absence of controls, the use of the preparation under study alone or with other medications, the evaluation of the patients' symptoms after treatment, all these factors complicate the process In the data presented here, however, these faults, although present have been somewhat minimized, since the figures were obtained largely through the efforts of a single agency the Committee on Therapy of the American Academy of Allergy (Table 1) [23] Standardized forms of investigation and reporting were used by approximately 75 physicians who were requested to study the effects of these drugs Benadryl was not included in the study of the Academy since it had been previously investigated by a great number of independent workers the findings of many of these investigators have been assembled in this article [24-29]

Hay Fever —In a series of 2 500 hay fever cases treated with the various antihistaminic drugs, from 60 to 75 per cent showed much improvement, the greatest degree occurring apparently in those with a slight or average pollen sensitiveness who were also undergoing pollen therapy The alleviating effects often were noticeable within a half hour of administration of the dose Many patients who received no pollen therapy but relied wholly on the drug obtained a good result. Patients with a high degree of pollen sensitiveness often obtained disappointing results Since there is no prolonged protection from these drugs the doses must be repeated two to four times daily from the onset of the pollen season until the end. Unpleasant effects of vertigo lassitude headache, and intestinal disturbances may prevent such extended treatment.

The antihistaminic drugs should not be used in an attempt to control the general or constitutional reaction resulting from overdosage in pollen therapy Epinephrine with its prompt and decisive effect is always indicated in such situations

Vasomotor Rhinitis —In a series of 614 cases of vasomotor rhinitis about 50 per cent were benefited These figures are lower than for those of hay fever since while hay fever is a single allergic

* This by no means comprises the present list of antihistaminic drugs. Since the completion of this study others have been made available commercially and there will be more.

entity being the result of pollen allergy, vasomotor rhinitis may be due to a multiplicity of causes such as airborne substances (dusts, animal danders, and vegetable powders), foods, drugs, bacterial sensitizations, and endocrine and metabolic disturbances The congestion of acute upper respiratory infections usually does not seem to respond to antihistaminic therapy, although there are occasional exceptions to the rule

Bronchial Asthma —In a series of 1,418 cases of bronchial asthma, 35 per cent reported an appreciable degree of improvement from the use of the antihistamines In many instances the drug was not used continuously, as in the cases of hay fever, but during or at the onset of attacks and in conjunction with other therapeutic measures In this series many allergies were probably of a bacterial type with pathologic intractable features which could not be expected to respond satisfactorily to the antihistamines No opportunity was offered for the classification of this group into the several clinical types of bronchial asthma, a step necessary for any accurate evaluation

In some instances, asthmatic patients given these drugs complain of a "drying effect" upon the respiratory membranes and seem to have an aggravation of the asthmatic symptoms following their use

Urticaria —Urticaria seems to be the clinical condition in which the antihistaminic drugs prove most useful, the cases benefited numbering 80 per cent in a series of 493 studied The acute cases obtain the greatest relief, but it must be remembered that in many instances the symptoms of urticaria are self-limited and disappear, regardless of the type of treatment Among the chronic cases where more complicated causes may be responsible for the symptoms, as endocrine disorders or chronic infections, the results are less satisfactory

The antihistaminic drugs have been found useful in pruritis ani and the pruritis of serum sickness and contact dermatitis [40] While the itching of poison ivy dermatitis may often be successfully controlled, the vesiculation is not lessened In the experimental animal, however, the development of the skin lesions of contact dermatitis has been successfully checked by local use of the drug [41] The antihistamines seem to be of little value in flexural eczema or neurodermatitis, except for relief of the itching [40] Physical allergies due to hypersensitivity to heat, cold, and sunlight often respond to treatment with these drugs [42 43]

Conflicting reports are given of their value in the treatment of migraine, gastrointestinal, and food allergies As yet, insufficient data has been obtained in these conditions

Dosage

These drugs are supplied in capsule or in tablet form for the adult and usually in an elixir vehicle for children The adult single oral dose is 25 and/or 50 mg , to be given preferably after meals The dosage for children is one half of this amount The dosage often may be doubled or tripled The unpleasant side-effects may effectively limit the amount of increase Antihistamines may be used locally for itching, 2 to 3 per cent in a water soluble or in an ointment base [44,45] Parenterally by injection, they are irritating, although they are used this way at times [40] Benadryl has been employed intravenously for migraine, and urticaria and is being studied for its effectiveness in aerosol form [39 40,46]

The antihistaminic drugs are offered as palliatives, they are in no sense curative Their great value is in the temporary relief of swelling and itching They develop no specific immunity for the patient They are unable, for instance, in the hay fever patient to replace immunizing pollen therapy Nor is their influence so sufficiently prompt or effective as to replace epinephrine in emergencies Even in moderate or severe allergic attacks, they are often less satisfactory than epinephrine or ephedrine

Side-Effects

The unpleasant associated effects mentioned, such as dizziness, lethargy, weakness, headache, stimulation, insomnia, and gastrointestinal disturbances, occur in approximately one third of all cases There seems to be great variation in individual effect, one commercial brand causing stimulation and another sedation in the same person In the next case, the effects may be reversed The dosage necessary to produce the effect also varies with the individual, in some it is so small as to discourage further use The majority of patients, however, overcome a part of the unpleasant effect by persistence In some apprehensive patients, the relaxing and somniferous effect may prove desirable

The antihistamines should not be employed without proper supervision A lad recently seen had become the object of concern to his high-school principal as well as his parents because of the gradual conversion of his ambition and interest in his studies into poor scholarship and indifference It was found that the parents had continued the regular and intensive use for his asthma of an antihistaminic drug advised by a physician deceased for more than a year No permanent harm apparently resulted, and within a week of discontinuing the drug the boy's original interests had returned

Summary

In summary it may be said that the anti-

histamine drugs have proved to be most helpful agents against those allergies whose symptoms result from sudden and acute edemas and against many forms of pruritis They are not intended to replace specific immunizing procedures, except possibly in the mildest of cases They are not intended to replace epinephrine or ephedrine. The chief criticism today against their use is the unpleasant side-effects—a criticism which promises to be lessened with the continued improvement in their manufacture.

Discussion

George F Koepf, *Buffalo*—Dr Spain and Dr Pflum have carefully pointed out the benefits as well as the harmful side-effects of many compounds with antihistaminic activity Judging from their review, it appears that these substances have been unusually successful in the control of the symptoms in many allergic disorders. This indicates that histamine plays an important role in the causation of allergic symptoms. However the fact that all allergic disorders do not disappear in all patients suggests that the role of histamine in the production of allergic manifestations may vary from patient to patient and from shock organ to shock organ The side-effects mentioned by the authors must be borne in mind and their evidence indicates that the benefits overbalance in most cases the harmful effects of the antihistaminic substances used clinically to date. Nevertheless the appearance of a potent but less toxic antihistaminic substance would be welcomed by the clinician

Two factors should be stressed in order to obtain equivalent or better effects First, the dosage must be carefully regulated before discarding the drug as useless In the absence of side-effects, the patient with a severe allergic manifestation who fails to respond to the usual amount of drug may respond to larger doses. For example in several cases of severe penicillin sensitivity with a marked generalized urticaria and joint pain and tenderness we have found it necessary to administer as much as 1 400 mg of pyribenzamine per day to obtain relief The premature abandonment of the drug would have resulted in failure in these cases.

Second, Dr Spain has pointed out that in the series of drugs studied, Hydryllin is the most beneficial for asthmatics. This may be due to a synergism involving benadryl and aminophyllin the two components of Hydryllin Experimental work has shown that such a synergism exists between pyribenzamine and ephedrine and between pyribenzamine and aminophyllin More recently Stavraky has also shown that certain iron salts may potentiate the effect of antihistaminic agents

GUIDED LIVER BIOPSY THROUGH LAPAROTOMY INCISION

EDWARD E JEMERIN, M D , New York City

(*From the Surgical Service of Mt Sinai Hospital*)

THE determination of the presence of distant spread to the liver is of obvious significance in deciding the operability of intra-abdominal neoplasms When laparotomy has been performed through a lower abdominal incision for a lesion of the pelvic viscera, one has to depend upon palpation for the interpretation of the significance of a nodule or nodules felt in the liver This may be deceptive in cases of pre-existing liver pathology or if only a small, solitary, uncharacteristic nodule is palpated. Under such circumstances, it would be of great help if a definitive biopsy of a liver nodule could be taken Yet, without extending the incision to an unwise degree this cannot ordinarily be done, and even when extended, it would probably be impossible to visualize for direct biopsy a nodule situated on the liver dome Confronted with such a situation recently, a simple device was utilized which enabled an adequate biopsy of the lesion in question to be effected

Case Report

E M , a man of seventy-seven, was admitted to Mt Sinai Hospital on September 17, 1947, with a history suggestive of incomplete large bowel obstruction Until three months prior to admission he had been in good health. At that time he became constipated, and what stools he had were loose and watery One month before admission, anorexia developed For eight days he had not had an adequate bowel movement although some flatus had been passed There had been no nausea or vomiting, but his abdomen, he stated, was somewhat larger than it had been previously Forty pounds had been lost in the last year There was a previous history of an appendectomy twenty years ago, followed by evisceration and secondary suture. Eighteen years ago an upper abdominal operation, the nature of which was not entirely clear, was performed As far as the patient could remember, some sort of epigastric tumor was removed

Examination revealed a moderately distended abdomen without palpable masses There was no tenderness There was a midline epigastric scar with an incisional hernia in it, and there were two right lower quadrant scars On rectal examination, at the tip of the examining finger anteriorly, there was the suggestion of a mass thought to be palpated through the rectal wall, as though a sigmoidal lesion had prolapsed into the cul-de-sac The remainder of the physical examination was of no significance. A flat plate of the abdomen showed moderate distention of the large bowel proximal to the rectosigmoid

An enema and colonic irrigation were immediately effective so that further study was undertaken Sigmoidoscopy showed a polypoid friable stenosing lesion occupying the anterior wall of the rectosigmoid, beginning 11 cm. from the anal margin Biopsy of this lesion showed fragments of colonic mucosa with severe acute inflammation and lymph channels filled with carcinoma cells

The patient was prepared for operation by cathartics, daily enemas and colonic irrigations, a low residue diet, sulfasuxidine by mouth, and various supportive measures, including parenteral fluids and vitamins, iron, and blood. After ten days of this preparation he was considered ready for resection.

Laparotomy was performed on September 27, 1947 The abdomen was opened through a left lower rectus, muscle-splitting incision. It was found that despite the extensive preoperative preparation the large bowel was still quite distended Apparently, a moderate degree of subacute obstruction persisted Resection at this stage was, of course, out of the question, and it was decided to perform a decompressing colostomy as a preliminary procedure However, exploration to determine future operability was made. Locally, an extensive lesion was found The rectosigmoid was the seat of a hard mass and was firmly baked into the bladder anteriorly and the other adjacent parietes No peritoneal implants were seen, and there was no gross evidence of spread to the regional lymph nodes Whether the reaction surrounding the local lesion represented inflammation solely or was comprised of carcinomatous infiltration in addition could not be determined It was felt, though, that preliminary colostomy drainage would permit whatever inflammation existed to subside, allowing resection at a later date if no distant metastases were present Accordingly, the liver was palpated This offered some difficulty because of adhesions of the abdominal contents to the anterior parietal peritoneum at the previous operative sites However, these were penetrated bluntly and the liver examined The left lobe of the liver was found to be free On the dome of the right lobe of the liver a single firm area was felt This was thought to be a metastasis but was not absolutely characteristic and, therefore, could not definitely be described as such. Since future management depended upon the nature of this liver nodule, it was important that definite information concerning it be acquired. Formal biopsy was out of the question through the incision that had been made, and naturally it was preferable to avoid making a second incision in the right upper quadrant for this purpose Actually, even through a right upper quadrant incision, biopsy would have been difficult because of the location of the lesion on the dome of the liver Accordingly, the following device was utilized in an effort to procure a biopsy

While one hand remained in the abdomen over the dome of the liver, an aspirating needle was intro-

duced through the right lower chest wall at the level suggested by the position of the fingers on the liver nodule. The fingers within the abdomen then guided the needle into the lesion The lesion was aspirated, and examination showed that a satisfactory piece of tissue had been obtained A piece of gelfoam was then introduced into the abdomen and placed on the aspiration site in order to prevent bleeding

The operation was completed by making a loop transverse colostomy over a glass rod through a separate supra-umbilical left rectus transverse incision The major incision was closed in layers

The biopsy proved to be satisfactory Histologic study revealed "fragments of liver tissue infiltrated by adenocarcinoma.' The colostomy was made permanent by dividing it completely across. The patient was discharged from the hospital on October 15 1947, in satisfactory condition with a functioning colostomy

Comment

The procedure described in the case report above presents a device by means of which a selective liver biopsy may be obtained once the abdomen has been opened, even though the abdominal incision is too far distant for direct biopsy under vision This is effected by guiding into a palpated liver lesion an aspirating needle introduced through the upper abdominal or lower chest wall, a hand inserted into the abdomen through the original incision serving as the guide. Such a procedure may be found useful on the various occasions that palpatory findings are not clear The true nature of pathology felt in the liver may be determined in this manner with relative assurance that the selected area is being sampled definitively In some cases this may have considerable value prognostically and in determining whether further surgery is indicated

Summary

A method is described for obtaining a selective liver biopsy by guided aspiration once the abdomen has been opened, notwithstanding an incision too distant to permit direct sampling under vision

---

SCHOLARSHIPS AWARDED FOR STUDY OF CEREBRAL PALSY

Eight physicians, surgeons, and therapists have been awarded scholarships for specialized training in cerebral palsy by the National Society for Crippled Children and Adults, Inc. This is the first national scholarship program established to meet the challenge of a crippling condition that disables some half million Americans, the Society stated.

Lawrence J Linck the Society's executive director, revealed that the scholarships were made possible under the first of six $5 000 yearly grants from Alpha Chi Omega, national women s sorority, which has adopted help to the cerebral palsied as its major national altruistic project. The scholarships will help meet the *acute shortage of specialists trained in* cerebral palsy a disability of muscular control which results from damage to control centers in the brain.

The first eight recipients are Arline F Bovee, Mukilteo Washington, Miriam Bunce, Denver, Colorado, Dr Harriet E. Gillette, Decatur, Georgia Dr Stanford F Hartman, Phoenix, Arizona, Bette Redwine, Albuquerque, New Mexico Dr Louis Spekter, Hartford Connecticut Joan A. Schauble Seattle, Washington and Dr Harold Westlake, Wilmette, Illinois.

The scholarships cover study at the Children s Rehabilitation Institute Cockeysville, Maryland, under supervision of the Institute s director Dr Winthrop M Phelps. Dr Phelps, internationally recognized authority on cerebral palsy, is also president of the American Academy for Cerebral Palsy and chairman of the National Society's Medical Advisory Council on Cerebral Palsy

The National Society whose services to all types of handicapped persons is made possible by the *annual sale of Easter Seals*, is the only agency conducting a nation wide program on behalf of the cerebral palsied. The recipients of the new scholarships will assist the Society's 2 000 state and local affiliates in expanding cerebral palsy facilities and research through hospital diagnostic and treatment clinics nursery schools for cerebral palsied children treatment centers, and special education and recreation projects.

SELECTION OF HYPERTENSIVE PATIENTS FOR SYMPATHECTOMY

HENRY I RUSSEK, M D , F A C P , JAMES L SOUTHWORTH, M D , F A C S , and
BURTON L ZOHMAN, M D , F A C P , Staten Island, New York

(From the Cardiovascular Research Division, U S Marine Hospital)

SURGICAL sympathectomy for hypertensive disease has had sufficient clinical trial to warrant certain conclusions regarding its applicability It is generally agreed that best results are obtained in patients under fifty years of age, having labile blood pressure, relatively unimpaired cardiac and renal function, and no arteriosclerotic complications Even when these conditions are satisfied, however, an appreciable percentage of the favorable cases remain unimproved or little benefited by surgical intervention On the other hand, dramatic response is occasionally encountered in cases viewed as unfavorable preoperatively

Since this surgical procedure is a major one, carrying a mortality and morbidity, some method is required which will permit the identification of favorable candidates for operation The most widely used laboratory test employed for this purpose is the sodium amytal test introduced by Allen and Adson [1 2] Three grains of this drug are given every hour for three hours, and the blood pressure is measured during this period It was originally hoped that the degree of fall in blood pressure would reflect the postoperative response Unfavorable results have been obtained, however, in many cases in which the test predicted a satisfactory outcome Allen actually found it easier to be accurate in the prediction of poor results than of good ones More recently, Hinton and Lord reported the sodium amytal test as being "a safe and simple method of measuring sympathetic tonus" [3] In general, they considered it to be broadly indicative of the type of postoperative blood pressure result which will be obtained following lumbodorsal sympathectomy Examination of their data, however, indicates that almost half of the subjects of their series who manifested a fair response to the sodium amytal test had a relatively poor result from surgery On the other hand, two out of eight patients with a poor sodium amytal response showed a good postoperative result Grimson has found that it is impossible to determine by this means which patients will receive benefit from operation [4] The writers, from their own experience, also believe that no reliance can be placed upon this procedure [5 6]

The cold-pressor test has been recommended to identify the so-called hyperreactor group of patients, i e , the ones in whom the nervous mechanism is considered largely responsible for the hypertension Inasmuch as almost all hypertensive patients are hyperreactors, the method would appear to be of little value in the problem of selection. Clinically, the test has not been found useful for this purpose

Other tests have been proposed, such as the administration of 1/2-grain doses of sodium nitrite each hour for six hours and the intravenous injection of pentothal sodium, but trial in various clinics has demonstrated the unreliability of these methods Smithwick has for some time employed the pulse pressure as a prognostic criterion [7] The results of sympathectomy are considered to be less favorable when the pulse pressure is high However, since increase of pulse pressure is generally attributed to loss of elasticity of the aorta and its large branches, the question arises as to whether this index of arterial aging is also capable of reflecting the degree of irreversible organic change in the arterioles Some authorities do not consider this to be the case

A valuable and accepted practice in surgery of the autonomic nervous system is the use of diagnostic procaine block prior to operation in an effort to predict postoperative results Several groups have considered that preoperative sympathetic block of this type might be of value in forecasting the outcome of lumbodorsal splanchnicectomy Schwartz and Findley suggested that paravertebral block of the sympathetic ganglia might accomplish this purpose.[8] Theoretically, this procedure would be ideal, but practically, its application is limited, owing to the large number of deep needle injections involved Page and his coworkers suggested that spinal anesthesia might be useful in selecting patients preoperatively by differentiating the "neurogenic" from the "humoral" form of the disease [9] Spinal anesthesia by the usual technic, however, is objectionable because it introduces several factors which might influence blood pressure aside from sympathetic nerve block.[6]

Russek and associates reported their experience with continuous caudal (high caudal block) and lumbar peridural anesthesia in selecting hypertensive patients for sympathectomy [5 6] In a small series of cases they found a close correlation between predicted and postoperative results In their opinion this test appeared to be an aid not only in the problem of selection but also in dictating the extent of sympathectomy

indicated in the individual case They con sidered caudal anesthesia superior to high spinal anesthesia when used for this purpose, because, with the former, muscle tone and respiration are little affected After further experience with a significant number of cases, these authors still consider an efficiently performed caudal test as the most accurate single procedure now available

Recently, Sarnoff and Arrowood have in troduced a method of spinal anesthesia in which there is no loss of motor power or muscle tone [10] Their method, called differential spinal block, is continuous spinal anesthesia in which 0.2 per cent procaine solution is introduced into the subarachnoid space by constant drip Their detailed studies show that with this method, sympathetic nerves are blocked coincident with loss of pain sensation to pinprick. By adjusting the dose, they can produce sympathetic block without interfering with tendon reflexes or muscle tone Tests are under way with differential spinal block to determine how effective it may be in predicting the results of dorsolumbar sym pathectomy

More recently, Etsten and Schwab produced a differential type of block by employing a technic consisting of the intermittent intrathecal in jection of concentrations of procaine ranging from 0.2 to 0 4 per cent over a period of an hour [11] The functional depression of the sympathetic chain was discerned by the measurement of electric skin resistance by means of a dermo meter The results of this test in 24 patients suggested that it may be a valuable prognostic guide to the neurosurgeon.

Temporary block of the sympathetic nervous system through the paranteral administration of tetraethyl ammonium chloride has been em ployed as a means of selection for surgery [12] Inasmuch as this drug causes a blockade of autonomic ganglia, parasympathetic as well as sympathetic, its generalized effect cannot be expected to mimic accurately that of lumbodorsal splanchnicectomy Although some have con sidered this test to be reliable, Page and his co workers have reported it to be of no value in the problem of selection [13]

In summary it may be stated that no test is yet available which will predict the hypertensive patient's postoperative reumbent blood pressure infallibly Although a block anesthesia test will come nearer doing this than any other single procedure, it must be emphasized that the test can foretell only the immediate postoperative result The height of the blood pressure one or more years after sympathectomy is largely de pendent upon sympathetic nerve regeneration and other factors. No test, therefore, can be expected to indicate long range results following operation

DR. VAN SLYKE HEADS NATIONAL HEART INSTITUTE

The National Heart Institute was established in August to combat heart disease, the nation s fore most killer Dr Cassius J Van Slyke a 47 year old Public Health Service veteran, was named direc tor

The institute was created by Congress to map a broad program of attack against all types of cardio vascular diseases.

Dr Leonard A. Scheele Surgeon General said the program will include research by the institute s staff, financial aid to outside institutions for research and training, fellowships for individual scientists and Federal grants-in-aid and technical assistance to the states for heart disease services

Dr Van Slyke, former chief of the research grants and fellowships division, will be under the general supervision of Assistant Surgeon General R. E. Dyer in his new post

Case Reports

TUBERCULOUS MENINGITIS COMPLICATED BY PREGNANCY

E G Silverman, M D , and T M Feinblatt, M D , Brooklyn, New York

(*From the Kings County Medical Division, Kings County Hospital*)

A SEARCH of the literature has failed to reveal a case of tuberculous meningitis treated by streptomycin with delivery of a healthy baby and subsequent recovery of the mother Such a case is presented in this report, along with a brief review of the other cases of tuberculous meningitis encountered at Kings County Hospital during the past five years

Of the 66 cases reviewed, there were 36 men and 29 women The average age was twenty-six and seven-tenths years, with the youngest fourteen months and the oldest sixty-seven years

In 36 cases, acid-fast bacilli were found by direct smear of the spinal fluid In the remaining 30 cases, the tubercle bacillus was not found on smear Ten of these were proved at autopsy In the remaining 20, the diagnosis was presumptive, based on the clinical picture and the changes in the spinal fluid

Six cases were treated with streptomycin, and, of this group, the case presented is the only one living at the time of this report Of the sixty not treated with streptomycin, there were no survivors

The average survival period after hospital admission of the untreated cases was 15 6 days, for the patients treated with streptomycin, the time was 66 8 days

Case Report

Mrs M P , aged 24, height 66 inches, weight 110 pounds, a white woman, was admitted to a private hospital in July, 1944, for minimal pulmonary tuberculosis She received supportive therapy and bed rest for four months At the end of this time, she was told that her lungs were well enough for her to return home and be treated by her local physician She spent the following three months in bed at home and was told, after repeated chest x-rays, that she could gradually resume activities

She was followed carefully with roentgenographic studies at the end of one month, three months, and finally at six-month intervals There was no apparent change Her last chest roentgenogram was taken in May, 1947 There were no changes from the previous film.

On May 20, the patient noted headaches and weakness of her lower extremities On May 30, she was admitted to a private hospital following an episode of delirium and emesis

That hospital reported delirium, high fever, neck rigidity, Babinski sign present bilaterally, and other signs of meningeal involvement Spinal tap showed initial pressure, 14 mm. Hg There was the appearance of ground glass The cells showed 150–100 per cent lymphocytes Protein was 57 mg , sugar was 60 mg , chlorides were 472 mg , smear was negative, and pellicle formation was present

She received 4 Gm of streptomycin intramuscularly over a four-day period while at this hospital and then was transferred to Kings County Hospital.

The medical history disclosed the usual childhood diseases In 1938 the patient sustained a fracture of the right ankle, which was treated surgically, leaving an ankylosed joint Menstruation began at 14 years of age with a regular 27-day cycle and three-to-four-day flow Her last menstrual period was January 3, 1947 There was no known tuberculosis in the family

On admission to Kings County Hospital on June 4, 1947, the patient's temperature was 100 F , pulse 90, respirations 20, and blood pressure 110/54. She was fairly comfortable, alert, and cooperative, complaining of headache

Physical Examination —The pupils were equal and active The neck showed tender cervical adenopathy (bilateral) The lungs were clear to percussion and auscultation The heart had a regular sinus rhythm, and was not enlarged to percussion, the sounds were of good quality, and no murmurs were heard The abdomen was soft and flat with no tenderness The uterus was enlarged to the size of a five-month pregnancy The pelvic examination was deferred. The extremities showed generalized increased reflexes with flexion contracture, there was an operative scar on the dorsal aspect of the left foot and a foot drop on the right The neurologic examination disclosed 4 plus nuchal rigidity The Babinski sign was absent bilaterally, while the Kernig sign was negative on the right and one plus on the left The Brudzinski sign was 4 plus

Hospital Course —In view of the history, clinical findings, and report on the spinal fluid, the diagnosis was possible tuberculous meningitis She was treated with 3 Gm of intramuscular streptomycin daily in divided doses Lumbar punctures were performed daily Smears and cultures were made for acid-fast bacilli On the fifth hospital day acid-fast bacilli were found in the spinal fluid by the Board of Health Laboratories After this, 0 2 Gm. of intrathecal streptomycin was given daily, in addition to the established intramuscular dosage No other positive smears or cultures were obtained, although all specimens were sent to both the hospital laboratory and the Board of Health

From the fifth hospital day (when acid-fast bacilli were found and intrathecal streptomycin begun) to the twelfth hospital day, the spinal fluid white blood cell count gradually dropped from a high of 2,000 to about 300 It remained low with slight fluctuations During this period the patient improved clinically

On the fifty-first day the patient appeared clini-

cally well but the spinal fluid white blood cells rose quite sharply to 2 500 (mostly lymphocytes) This demonstrated a more active tubercular process Intrathecal streptomycin was increased to 0 3 Gm. daily with parenteral dose remaining the same On the next day the white cell count had dropped to 250

On the fifty-seventh hospital day the patient complained of headache nausea and pains in both legs radiating downward from hips to below the knees. On the previous night she had experienced some vertigo There was no tinnitus.

After a comfortable day, she suddenly became stuporous on the evening of her sixty fifth hospital day This lasted several hours. The next morning she was alert and cooperative with no subjective complaints. Her neck was supple and only minimal neurologic signs were present.

On the sixty-ninth hospital day the patient became lethargic and complained of headache and emesis. Intrathecal streptomycin was stopped.

On the seventy-second day the patient had been asymptomatic for two days Intrathecal streptomycin was started again at a dosage schedule of 0.3 Gm. once each day

On the seventy fifth hospital day a convulsive seizure developed. It started with twitching of the eyelids, progressed to clonic movements of both upper and lower extremities There was frothing at the nose and mouth. Ten minutes later the patient was comatose and markedly cyanotic with labored respirations. The chest was full of moist rales, predominantly in the upper lung fields. Neurologic examination was unsatisfactory The neck was supple and Babinski sign was absent.

Impression.—Convulsion was probably secondary to meningeal irritation due to intrathecal streptomycin.[1] Intrathecal streptomycin was discontinued. The intramuscular dosage was not changed.

The patient improved rapidly Within a few days she was oriented and comfortable.

On the ninety-seventh hospital day a healthy male child was delivered with the aid of low forceps and under local anesthesia.

The patient has been completely asymptomatic since August 17 The last lumbar puncture performed on December 23 showed only 30 lymphocytes.

Audiometric Examination.—The ears had both drums and canals normal. There was no mastoid tenderness. Hearing according to the Weber test, was lateralized to the left. The Rinne test disclosed that air conduction was greater than bone conduction bilaterally The Schwabach test showed that bone conduction was reduced about one half bilaterally

The vestibular function showed no spontaneous nystagmus Caloric testing with ice water 40 cc in 15 seconds gave no response for either ear

The impression was of impaired hearing and vestibular function central type, caused by basilar meningitis and streptomycin reaction.

Streptomycin levels were spinal fluid high of 31 units per cc. and low of 1 unit per cc., blood a high of 16 units per cc. and a low of 4 units per cc.

Follow-up.—On August 20 1948 eight months after leaving the hospital the patient and baby are living and well

Summary

A case of tuberculous meningitis complicated by pregnancy with the delivery of a healthy infant and clinical arrest of the meningitis, has been presented

A total of 315 Gm. of streptomycin was given intramuscularly over a period of one hundred five days. A total of 15 4 Gm. of streptomycin was given intrathecally over a period of seventy two days

PENICILLIN NAMES BAFFLE DOCTORS

Trade names for penicillin are becoming so numerous and so confusing that even doctors cannot keep up with the terminology according to an editorial in the July 17 issue of the *Journal of the American Medical Association*

Doctors have to contend with such titles as Buffecillin, Duracillin Poultrycillin Dairycillin, Denticillin, Pen-Troche and P O B the editorial says.

The *Journal* protested editorially in 1946 against the multiple names for the product. Now comes procaine penicillin with a variety of titles that fail to indicate the nature of the product and a number of other penicillins named with relation to the section of the body at which they are aimed

The editorial entitled More Silly Names for Penicillin Products follows in part

To select a rose from such a garden would require a botanist with more basic knowledge of the naming of plants than most physicians possess. Perhaps the next step will be numbers to correspond with certain entrances or exits of the human body we may be talking about cillin No 1' for the front and cillin No 2' for the rear

In a previous editorial attention was called to the combination of the manufacturer's name with cillin. Since there were almost 30 manufacturers, that offered almost 30 possibilities Now the emphasis seems to be inclining toward the port of entry plus cillin.

The Council on Pharmacy and Chemistry in recent years has tried to be more than reasonable about the acceptance of fanciful names for widely used products of varying manufacture Even the patience of the proverbial Job would be tried by contemplation of a list such as is here cited

In the previous editorial the editor offered 8 to 5 that doctors would not guess the nature of a product called Penoral. The odds are improving We now offer 5 to 1 on P O B

HEPATITIS DUE TO CINCOPHEN, WITH RECOVERY

ZACHARY H BENJAMIN, M D , New York City

(From the Bellevue Hospital)

THIS case is being reported because it shows several interesting and unusual aspects, the rarity of the disease at this time, the complete discrepancy between the clinicopathologic findings and the laboratory, and a liver biopsy during the course of the disease

[illegible] decades ago, cinchophen poisoning was not uncommon This was to be ascribed to its [illegible] and to the fact that it could [illegible] the counter and was an ingredient [illegible] remedies" [1] Undoubtedly, [illegible] occurred and were not recognized as the causative agent was not suspected or [illegible] 1936, Palmer and Woodall collected cases with 88 deaths of hepatitis associated with cinchophen administration [2] Since [illegible], there were reported [1,3–6] [illegible] there is no [illegible] seven years months [illegible] were found by direct examination of [illegible] In the remaining 30 [illegible] was not found on smear [illegible] at autopsy In the [illegible] was presumptive, based [illegible] changes in the spinal [illegible] streptomycin, and, [illegible] is the only one [illegible] Of the sixty not [illegible] were no survivors [illegible] after hospital admission was 15 6 days, for [illegible] streptomycin, the time [illegible], weight 110 [illegible] to a private [illegible] pulmonary tuberculosis [illegible] therapy and bed [illegible] this time, she [illegible] enough for her [illegible] her local physician [illegible] this in bed at home [illegible] chest x-rays, that she [illegible] with roentgenographic [illegible] with, three months, and [illegible] There was no apparent [illegible] chest roentgenogram was [illegible] There were no changes from [illegible] the patient noted headaches and [illegible] of her lower extremities On May 30, [illegible] was admitted to a private hospital following an [illegible] episode of delirium and emesis.

That hospital reported delirium, high fever, neck rigidity, Babinski sign present bilaterally, and other signs of meningeal involvement. Spinal tap showed initial pressure, 14 mm Hg There was the appearance of ground glass The cells showed 150–100 per cent lymphocytes. Protein was 57 mg , sugar

Examination revealed an elderly white man in no acute distress with moderate icterus of sclerae and skin Blood pressure was 130/75, temperature 98 4 F Head, neck, heart, and lungs were otherwise negative, and the liver and spleen were not palpable A few small hemorrhoids were found on rectal examination, and a bilateral equinovarus deformity was noted The patient was placed at bed rest, and therapy consisted of a high protein, high carbohydrate diet with vitamin and protein supplements and choline, methionine, and vitamin K by mouth On the following day, the icterus index was 60, the cephalin flocculation was negative in forty-eight hours, and the urine was positive for bile but negative for urobilinogen

During the first week at home the patient was fairly comfortable and stable, the only complaint being marked anorexia His stools were consistently light, except for one day when they were dark On occasion the liver edge could be palpated just beneath the costal margin on deep inspiration, but never was there any tenderness The day before admission the jaundice became more intense and the pruritus and anorexia more severe The patient was admitted to the hospital on July 10, 1947

Physical examination revealed 4,170,000 [illegible] blood cells, 13 Gm of hemoglobin, and 10,900 and active blood cells with 70 per cent polymorphoadenopathy (bilateral) The lungs, and 3 per cent percussion and auscultation negative except for 4 regular sinus rhythm, and was not rate was 46 mm. in cussion, the sounds were of good direct, prompt, 18 4 murmurs were heard The abdome[illegible]d as a faint trace in flat with no tenderness The uterus[illegible] to the size of a five-month pregnancy[illegible] eight hours The examination was deferred The extrem[illegible]-globulin ratio generalized increased reflexes with flexio[illegible] units, and a ture, there was an operative scar on t[illegible] serum amylaspect of the left foot and a foot drop on [illegible] subsequent urine The neurologic examination disclose[illegible]sitive in a dilunuchal rigidity The Babinski sign were positive for bilaterally, while the Kernig sign was [illegible] pertinent the right and one plus on the left. The A simple film sign was 4 plus [illegible], and a gastro-

Hospital Course —In view of the history findings, and report on the spinal fluid, [illegible] July 16, 1947, was possible tuberculous meningitis [illegible] the seventy-treated with 3 Gm. of intramuscular [illegible] normal liver function daily in divided doses Lumbar [illegible] on July 19, 1947, performed daily Smears and cul[illegible] second specimen after in- for acid-fast bacilli On the fif[illegible] fast bacilli were found in [illegible] Board of Health Laborat[illegible] of intrathecal streptomyc[illegible] tion to the established [illegible] other positive smears [illegible] although all specimens [illegible] pital laboratory and the

From the fifth hospital [illegible] were found and intrathec[illegible] the twelfth hospital day, [illegible] cell count gradually dropp[illegible] about 300 It remained [illegible] ations During this peri[illegible] clinically

On the fifty-first day th[illegible]

	Albumin-Globulin Ratio	Prothrombin Time Seconds	Alkaline Phosphatase Units
[illegible]tal			
[illegible]ro-

	1 33		
	2 40		

stillation of magnesium sulfate and occult blood in all specimens. For two to three days after the duodenal drainage the stools were dark green and then reverted to a light yellow There was a slight temporary drop in the serum bilirubin from 33.6 to 20 7 after this occurrence, but it rose again to as high as 34.6. Subsequent cephalin flocculation tests were never more than a trace in forty-eight hours.

During this period of hospitalization the patient's temperature was always normal, but his course was progressively downhill with increasing weakness, weight loss, anorexia, some upper abdominal distension nausea, and pain. The pruritus was well controlled by synergen at first and then by pyribenzamine in 50-mg. doses.

Inasmuch as the evidence pointed so strongly to an incomplete or intermittent obstructive jaundice, despite the history of cincophen after suitable preparation with blood transfusion and intramuscular vitamin K the patient was operated on under spinal anesthesia on July 30 1947, twenty days after admission and thirty nine days after the onset of his illness. At operation the entire extrahepatic biliary tract, gastrointestinal tract, and pancreas were normal. The liver and spleen were slightly enlarged the former being firm greenish, and finely granular A section of liver was taken for biopsy and was reported by Dr Henry Brody as follows (Fig 1)

Gross examination Three tiny wedges of liver deep brown in color with numbers of gray dots.

Microscopic examination The liver cells are markedly swollen practically obliterating the sinusoids. However there is no destruction of the normal architectural arrangement of the liver cords no necrosis is found Many cells in the liver cords have larger than normal nuclei some are binucleated The cells show little vacuolation they are finely granular Some cells show a central concentration of the granular material. In addition many contain fine greenish-brown pigment granulation. In the central portion of each lobule the bile canaliculi are strikingly distended. Bile is also seen accumulated between liver cells and within Kupfer cells The portal spaces appear compressed There does not appear to be any real increase in portal fibrous tissue The portal areas all show considerable round cell infiltration The portal bile ducts do not appear to be distended, nor do they contain bile pigment

Diagnosis Granular degeneration of liver cells. Central bile stasis.

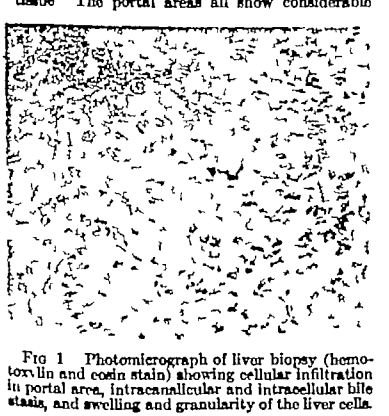

FIG 1 Photomicrograph of liver biopsy (hemotoxylin and eosin stain) showing cellular infiltration in portal area, intracanalicular and intracellular bile stasis, and swelling and granularity of the liver cells.

The patient s immediate postoperative course was good. He was given a continuous intravenous injection of glucose in distilled water and glucose in saline, to which was added daily 1,000 cc. of parenamine, 10 Gm. of methionine parentosol, vitamin K, and ascorbic acid. On the second postoperative day he began to take small amounts of fluid and food by mouth. By the evening of the third postoperative day, he began to have severe nausea and upper abdominal distress, associated with increasing restlessness. He was given codeine and sodium phenobarbital for sedation, but by the following day August 3, 1947 he gradually became semistuporous, disoriented and, at times, violently irrational and hallucinatory His temperature began to rise very gradually up to 101 6 F A sweetish fetid odor (fetor hepaticus) was noted that pervaded the entire room. Blood chemistry at this time revealed no essential change from previous ones, except for considerable lowering of the total protein to 4.32 Gm. with an albumin-globulin ratio of 1 09

Therapy consisted of approximately 4,000 to 5,000 cc. of intravenous fluid daily consisting of 15 per cent glucose in distilled water 10 per cent glucose in saline and 1,000 cc. of parenamine Ten grams of methionine, vitamin B complex, and ascorbic acid were added to the intravenous injection. Twenty to thirty units of insulin were added to each 1 000-cc. flask containing glucose, and 2 cc of crude liver were given intramuscularly daily

The patient was critically ill and almost moribound for twenty four hours when the temperature began to drop and he began to respond slowly Three days later, on August 6 1947, he began to take small amounts of fluid by mouth, but his main intake for about one week was intravenous fluids as above His total intake was kept between 4 000 and 5 000 cc. of fluid daily with a corresponding urinary output. Several transfusions were given during this period. By August 7 1947 he was taking small amounts of food by mouth and was given 5 units of insulin before each meal to stimulate his appetite At this time he still had a low-grade fever with no signs of infection. The penicillin was stopped, and the temperature returned to normal in twelve hours. During the ensuing few days, the infusions were cut down as the patient took more and more by mouth. On August 10 1947, one hour after intravenous parenamine, the patient had a severe chill with a rise in temperature to 103.4 F By August 12, 1947, he was getting only 1 000 cc. of 10 per cent glucose in distilled water with 10 Gm of methionine By the following day all the infusions were stopped. The patient was then taking a full high protein high carbohydrate diet with vitamin and protein supplements methionine choline, and ferrous sulfate by mouth, and 2 cc. of crude liver intramuscularly daily Following surgery his bilirubin gradually dropped to 12.8 mg. per cent. His cephalin flocculation was never more than 2 plus in forty-eight hours and by August 15, 1947 his stools were consistently dark brown and his urine light in color He was discharged from the hospital on August 16 1947, thirty-eight days after admission, to convalesce at home.

Following discharge the patient continued to improve very rapidly in regard to weight, appetite, strength and loss of icterus. He was continued at

bed rest for a while and then gradually allowed to resume activity, so that by September 15, 1947, he was completely ambulatory and by October 1, 1947, he had returned to his business for short periods His jaundice rapidly cleared, by August 21, 1947, it was 0 5 mg per cent, September 6, 1947, 0 25 mg per cent, October 7, 1947, 0 2 mg per cent, and November 6, 1947, 0 2 mg per cent Cephalin flocculation on November 6, 1947, was 1 plus in forty-eight hours During this period of convalescence, the oral medication and supplements and intramuscular crude liver were gradually cut down and were completely eliminated by October 1, 1947, except for vitamin supplements and ferrous sulfate The patient is now well and moderately active in business At present he shows no sequelae

Comment

The most interesting feature of this case is the discrepancy between the clinicopathologic findings and the laboratory findings The impairment of excretory function, manifested by marked jaundice, in contrast to normal metabolic function as evidenced by the cephalin flocculation, the normal cholesterol and esters, the normal total protein and albumin-globulin ratio, negative to normal urine urobilinogens, normal prothrombin times, normal intravenous galactose tolerance test, and the response to duodenal drainage, pointed to an obstructive jaundice

The clinicopathologic findings in this case are quite similar to a series of cases, reported by Watson, of infectious hepatitis of the periacinar or cholangiolitic type which display all the signs and laboratory findings of a severe regurgitation jaundice with little or no evidence of impairment of metabolic liver function [10] Similar findings have been reported in toxic hepatitis due to arsenicals and thiouracil [11 12]

This case again serves to point to the fact that at the present time our battery of available liver function tests are not entirely adequate to detect disturbed liver metabolism, and that in occasional cases more attention must be paid to a significant fact in the history, i e , ingestion of a known hepatotoxic agent, although all the chemical findings point in a different direction In this particular case, as this patient had had severe jaundice for about six weeks and the evidence for obstruction was so strong, it being felt that further delay would not be in the best interest of the patient, laparotomy was done

It is difficult to estimate how large a part the surgical procedure played in the development of the acute hepatic decompensation Judging from the preoperative course, it is highly probable that the sequence of events might have been the same without surgery The intensive parenteral administration of methionine, protein, and glucose undoubtedly contributed to this patient's prompt and apparently complete recovery

Summary

1 A case of hepatitis due to cincophen is presented

2 The inability of the laboratory to demonstrate impairment of liver function in a seriously damaged liver is shown

3 Complete recovery of a patient in acute liver decompensation followed the intensive parenteral administration of methionine, protein, and glucose

ENROLLMENT IN MEDICAL CARE PLANS PASSES EIGHT MILLION MARK

Enrollment in nonprofit prepayment plans for medical care passed the 8,000,000 mark during the second quarter of 1948 The Blue Shield enrollment report for March 31, 1948, covering all nonprofit plans in the nation with medical or Blue Cross sponsorship, revealed a first quarter total of 7,928,128

Although all nonprofit plans were included in the tally, some of the reporting organizations are not known as Blue Shield Plans, or affiliated with Associated Medical Care Plans Blue Shield Plans recorded a total membership of 6,473,439 persons, approximately 80 per cent of the grand total

Total membership gain during the first quarter of 1948 was 645,222 persons, representing a 9 19 per cent increase over December 31, 1947

Michigan Medical Service continues to be the largest Blue Shield Plan in the United States with a total enrollment of 981,729

NECROLOGY

Edward Joseph Bedell, M D., of Delmar died on September 23 at the age of eighty four Dr Bedell was graduated from Albany Medical College in 1893 and had practiced medicine in Bethlehem for more than fifty years. Dr Bedell retired last year after serving as health officer of the town for twenty years.

Willis S. Cooke, M.D., of Cazenovia, died on September 2 Dr Cooke was graduated from New York University School of Medicine in 1898 and served as a major during World War I He was a retired member of the New York State Compensation Board and had formerly practiced in Otsego and Oneonta.

Paul Dineen M.D , New York died on September 20 He was sixty years old Dr Dineen was graduated from the College of Physicians and Surgeons Columbia University in 1919 and was elected to the national honorary medical society, Alpha Omega Alpha. A first lieutenant during World War I, he received the French *Croix Epidemies* for his service with the 9th Base Hospital in France Director of of the department of medicine of the International Telephone and Telegraph Corporation since 1928, Dr Dineen had taught experimental and clinical surgery at New York Hospital since 1932 He also served as an associate surgeon on the staff of this hospital. In 1946 he was president of the surgical section of the New York Academy of Medicine and was a member of its advisory board until his death. Dr Dineen was a member of the American Medical Association, the New York Academy of Medicine, the New York Surgical Society and the New York State and County Medical Societies.

James Maurice Downey, M.D., died on September 12 at his home in Brooklyn. His age was seventy nine. Dr Downey was graduated from the Long Island College Hospital in 1891 and interned at St. Mary s Hospital Brooklyn. Dr Downey was senior attending surgeon of the Holy Family Hospital, Brooklyn, and a consultant surgeon on the staff of Mercy Hospital, Rockville Centre. An honorary police surgeon former president of the Brooklyn Surgical Society and a fellow of the American College of Surgeons, he was also a member of the American Medical Association, the Brooklyn Surgical Society and the New York State and County Medical Societies.

John William Edwards, M.D , seventy-nine, of Brooklyn, died on September 19 A physician in Brooklyn for more than forty years, Dr Edwards was graduated from the Long Island College Hospital in 1907 and for many years was on the staff of Swedish Hospital, Brooklyn During the Spanish American War Dr Edwards served as hospital steward for the 114th Provisional Regiment and during World War II was chief surgeon of the New York Police Reserves. Dr Williams was a member of the American Medical Association and the New York State and Kings County Medical Societies.

William Christian Hager, M.D., a physician in Brooklyn for more than forty years died on September 12. He was eighty two years old Dr Hager was graduated from the Long Island College Hospital in 1890 He had retired from practice two years ago

Benjamin Kaufman, M D , aged fifty-seven, of Brooklyn, died on June 20 Dr Kaufman was graduated from University and Bellevue Medical College in 1912 and interned at Beth Israel Hospital New York City He served as an associate attending surgeon at Israel Zion Hospital, Brooklyn and was a member of the American Medical Association and the New York State and Kings County Medical Societies.

Louise Hopkins Meeker, M.D , of Scarsdale, died on September 21 at the age of sixty-nine. Dr Meeker was graduated from Boston University School of Medicine in 1906 and served as assistant professor of pathology on the staff of New York Post-Graduate Medical School and as associate attending pathologist in the New York Post-Graduate Hospital and Dispensary from 1917 until her retirement in 1946 Dr Meeker a diplomate of the American Board of Pathology, was a member of the American Medical Association, the American Association of Pathologists and Bacteriologists, the New York Academy of Medicine the New York Pathological Society and the New York State and Westchester County Medical Societies.

Homer W Smith M D., of Rochester died on September 5 He was sixty-three years old. Dr Smith was graduated from the University of Buffalo School of Medicine in 1913 Dr Smith was a former president of Park Avenue Hospital Rochester where he also served as pathological surgeon. He was a physician on the staff of Monroe County Infirmary and a former member of the Rochester Health Bureau. During World War II he was examining physician for Selective Service in Rochester Dr Smith was a member of the American Medical Association, the Rochester Academy of Medicine, and the New York State and Monroe County Medical Societies.

BCG inoculation is worthwhile in tuberculin negative individuals liable to exposure to tuberculosis, but because its protection is only partial, vaccination should be done on an individual basis.—*Exchange*

The average age of patients dying of tuberculosis today is over forty —*Exchange*

Frequent chest colds are suggestive of bronchiectasis.—*Exchange*

MEDICAL NEWS

Appoint Advisory Council on Mental Health

APPOINTMENT of an advisory council to assist the Department of Mental Hygiene in the expansion of the State's mental health program to cope with growing community needs was announced by Dr Frederick MacCurdy, Commissioner of Mental Hygiene, with the approval of Governor Dewey

The council represents various aspects of community activity in the fields of psychiatry, social welfare, general medicine, and public health

The council, which will meet monthly with Dr MacCurdy, conducted its initial meeting September 15 Dr Howard W Potter, professor of psychiatry at the Long Island Medical College, is chairman of the council, other members being Dr Edward A Spar, psychiatrist in private practice and consulting neurologist of Buffalo, Dr S Bernard Wortis, consultant in mental hygiene to the United States Public Health Service and professor of psychiatry at New York University College of Medicine, who represents the New York State Medical Society, Dr J Lawrence Pool, neurosurgeon, Neurological Institute, New York City, Dr L Whittington Gorham, formerly physician-in-chief at Albany Hospital and professor of medicine at Albany Medical College, Marian F McBee, psychiatric social worker and executive secretary of the New York Committee on Mental Hygiene of New York City, Ralph King, president of the New York State County Welfare Association, of Elizabethtown, and Judge Henry J A Collins of the Nassau County Children's Court

Dr MacCurdy said that the council will assist him and his staff in a number of projects, including a more comprehensive educational program to promote the mental health of children and development of plans in cooperation with hospital groups for greater provision for care of mentally ill patients in general hospitals

Facilities for child guidance and mental health clinics will be studied as a step toward amplifying the program for mental health among children The council and the department will study community requests for aid

Examination Announced for Medical Officer Positions

THE United States Civil Service Commission has announced an examination for filling Medical Officer positions in Washington, D C, through the United States, and in the Panama Canal Zone, at salaries ranging from $4,479 to $6,235 a year Positions in the following fields of medicine will be filled from this examination general practice, anesthesia, aviation medicine, bacteriology (medical), cancer, research and diagnosis and treatment, cardiology, dermatology, epidemiology, gynecology, internal medicine and diagnosis, maternal and child health, obstetrics and pediatrics, medical pharmacology, neurology, neuropsychiatry, occupational health and medicine, ophthalmology, otolaryngology, pathology, physical medicine, physiology, psychiatry, public health, general and veneral disease control, roentgenology, surgery—chest, general, orthopedic, and plastic, tuberculosis, urology, administrative medicine, and adjudicative medicine

No written test is required to qualify for the positions Applicants must be graduates of a medical school and must be currently licensed to practice medicine and surgery (The requirement of a current license will be waived for certain persons and positions) For positions paying $4,479 and $5,232, applicants must have completed a full internship, either general rotating or in a specialty (this requirement is waived for some positions), and for positions paying $5,232 and $6,235, they must have had professional medical experience Maximum age limits for these positions are as follows For Panama Canal Service, forty-five years, for Indian Service, fifty years, for other agencies, sixty-two years For persons entitled to veteran preference, the forty-five and fifty-year age limits are waived to sixty-two years and the sixty-two year age limit is waived without limitation

Interested persons may obtain information and application forms from most first and second class post offices, from Civil Service regional offices, or from the U S Civil Service Commission, Washington 25, D C Applications will be accepted in the Commission's Washington office until further notice

Prize Awards for Essays Announced

THE American Goiter Association again offers the Van Meter Prize Award of $300 and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland The award will be made at the annual meeting of the Association which will be held in Madison, Wisconsin, May 26, 27, and 28, 1949, providing essays of sufficient merit are presented in competition

The competing essays may cover either clinical or research investigations, should not exceed 3000 words in length, must be presented in English, and a typewritten double-spaced copy sent to the corresponding secretary, Dr T C Davison, 207 Doctors Building, Atlanta 3, Georgia, not later than March 15, 1949 The committee who will review the manuscripts is composed of men well qualified to judge the merits of the competing essays

A place will be reserved on the program of the annual meeting for presentation of the Prize Award Essay by the author if it is possible for him to attend The essay will be published in the annual proceedings of the Association This will not pre-

vent its further publication, however in any journal selected by the author

The American Urological Association offers an annual award of $1,000 (first prize of $500 second prize $300 and third prize $200) for essays on the result of some clinical or laboratory research in urology Competition shall be limited to urologists who have been in such specific practice for not more than five years and to residents in urology in recognized hospitals.

The first prize essay will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Biltmore Hotel in Los Angeles May 16 to 19, 1949

For full particulars write the secretary Dr Thomas D Moore, 899 Madison Avenue, Memphis 3, Tennessee Essays must be in his hands before February 15 1949

MEETINGS

PAST

Eastern New York Eye, Ear, Nose and Throat Association

A clinic day, held on October 7, opened the fall activity for the Eastern New York Eye Ear Nose and Throat Association with the group meeting at the Albany Hospital, Albany The evening program included a dinner at the Albany Country Club, followed by an address by Dr Charles J Imperatori on 'Problems Facing the Otolaryngologist.'

New York Council of Surgeons

Dr George Schwartz presented a paper on "Immediate Therapeutic Approach to the Common Cardiac Emergencies at a meeting sponsored by the New York Council of Surgeons, held September 21 at the Parkchester General Hospital, Bronx

At the session on September 28 at the Parkchester General Hospital Dr Harry Wallerstein, hematologist at Jewish Memorial Hospital Brooklyn, spoke on "Management of Erythroblastosis Fetalis"

New York Psychoanalytic Society

The 309th meeting of the New York Psychoanalytic Society was held September 28 in New York City Dr Gustav Bychowski presented a paper on 'Neurotic Obesity' The talk was followed by an executive session.

FUTURE

Syracuse Academy of Medicine

Postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Medical Society, in cooperation with the State Department of Health, will be given for the Syracuse Academy of Medicine on Tuesday night, October 19 at 8 30 P.M. at the University Club Syracuse.

Dr Isadore Snapper clinical professor of medicine at Columbia University, College of Physicians and Surgeons and director of medical education at Mt. Sinai Hospital, New York City, will speak on Osseus Manifestation of Medical Diseases.'

Metropolitan New York Chapter Association of Military Surgeons of the United States

A symposium on "Rehabilitation will be held Wednesday night, October 27 at 8 30 P.M. at the New York University Bellevue Institute of Rehabilitation and Physical Medicine 325 East 38th Street, New York City as the first of the fall meetings of the Metropolitan New York Chapter, Association of Military Surgeons of the United States. The symposium will include a demonstration of 'Dynamic Therapeutics in Chronic Disease.

Program for the symposium includes "Rehabilitation—Its Place in the Practice of Medicine" Dr Howard A. Rusk, director New York University Bellevue Institute of Rehabilitation and Physical Medicine, Rehabilitation—Its Place in the General Hospital, Dr Donald A. Covalt, clinical director of the Institute Some Emotional Factors in Physical Disability' Dr Morris Grayson director of psychiatric research at the Institute and Rehabilitation of Motor Disabilities, Dr George G Deaver professor of clinical rehabilitation and physical medicine New York University College of Medicine with demonstration of patients by Dr Deaver and staff

Inter American Congress on Brucellosis

The second Inter American Congress on Brucellosis will be held from November 17 to 20 in Mendoza, Argentina, and from November 22 to 26 in Buenos Aires. Dr Harold J Harris, New York City will attend the Congress and read a paper on "Recent Advances in the Diagnosis and Treatment of Brucellosis.

Further information may be obtained from the president of the American Committee, Alice Evans 2001 Connecticut Avenue N W Washington D C.

PERSONALITIES

Honored

Dr Lewis X. Fitz Simmons, Pulteney by the Steuben County Medical Society, on his completion of fifty-eight years of active practice.

Awarded

Dr Richard Kovacs New York City the Distinguished Service Key and Citation from the American Congress of Physical Medicine 'in recognition of his contributions to the advancement of the science and art of physical medicine as a writer of outstanding distinction, and particularly as editor of the *Year Book of Physical Medicine*

Appointed

Dr Robert C Berson Rye as assistant dean of

the University of Illinois College of Medicine, and as assistant director of clinics for the University of Illinois hospitals Dr Malcolm A. Bouton, district State health officer, to the post of city health commissioner of Schenectady Dr Herman E Hilleboe, State commissioner of health, as director of the new Department of Preventive Medicine and Public Health, Albany Medical College Dr Ray E Trussell, epidemiologist in the State Health Department, as professor of preventive medicine and public health, Albany Medical College Dr Cornelius H. Traeger, New York City, as medical director of the National Multiple Sclerosis Society

Dr William L Watson, chief surgeon of the Thoracic Surgical Service, Memorial Hospital Center for Cancer and Allied Diseases, New York City, as associate professor of surgery, New York University College of Medicine

Elected

Dr William G Keens, Albany, as grand medecin of the Grand Voiture, 40 and 8 Society of New York.

Speakers

Dr Arthur J Bedell, Albany, a series of three lectures at the meeting of the Pan Pacific Surgical Association in Honolulu, Hawaii, August 30 to September 13 Dr Theodore R Miller, New York City, on "Treatment of Malignant Melanoma and Symptomatology of Gastric Cancer" at the annual meeting of the Utah State Medical Association held in Cedar City, Utah, on September 2, 3, and 4

Dr Bernard Roswit, director of the radio-isotope section of the Veterans Administration Hospital in the Bronx, on "Use of Radio-isotopes in Diagnosis and Treatment of Cancer and Certain Blood Diseases" at a meeting of the Dora Paul Fund for Cancer Research, September 22 in New York City

Dr George T Pack, New York City, on "Recent Advances in the Treatment of Gastrointestinal Cancer" at the meeting of the Montgomery County Medical Society, Silver Spring, Maryland, on September 21

New Officers

Dr Jack F Bailey, Mansfield, Pennsylvania, who was attached to the First Division of the U S Marine Corps during the war and saw extensive service in the Southwest Pacific, general practice in Owego

Dr Charles Friedman, Poughkeepsie, formerly on the surgical staff of the Army General Hospitals in India, general practice in Highland Dr Joseph Isenstead, Sharon Springs, general practice in Palatine Bridge Dr Clyde L Nagle, Navy veteran, general practice in Elmira Dr John B Phillips, battalion surgeon in the European theater during the war, practice of obstetrics and gynecology in Schenectady Dr Charles Lee Sprinkle, former medical officer with the Fleet Marine Corps overseas, practice of internal medicine in Ithaca Dr L J Strobino, Bethel, Connecticut, Army veteran who served as chief of orthopedic service with the 52nd Station Hospital in North Africa and Italy practice of orthopedic and traumatic surgery in Utica

COUNTY NEWS

Albany County

The first fall meeting of the Albany County Medical Society was held September 22 at the Albany College of Pharmacy Dr Edward S Goodwin, associate professor of pediatrics at Albany Medical College and attending pediatrician at Albany Hospital, gave the vice-presidential address on 'Glycogen Storage Disease"

On September 16 members of the Albany County Medical Society joined with the Albany County Bar Association for a field day at Wolferts Roost. Dr Sheldon Church was chairman of the Medical Society committee, which included Drs John J Marra, Christopher Staler, Jr, James H Flynn, Arthur W Rupert, Edgar N Kemp, and Victor N Tompkins. Dr John J Clemmer is president of the Society

Columbia County

Dr Edward F Hartung, assistant clinical professor of medicine and chief of the division of arthritis, New York Post-Graduate Medical School, New York City, addressed the meeting of the Columbia County Medical Society held October 5 at the St. Charles Hotel, Hudson His topic was "Newer Aspects in the Treatment of Arthritis" The postgraduate instruction was arranged by the State Society Committee on Public Health and Education with the cooperation of the State Department of Health

Fulton County

As a program of postgraduate instruction, Dr Walter F Rogers, Jr, instructor in medicine at the Syracuse University College of Medicine, addressed the meeting of the Fulton County Medical Society held September 23 in Gloversville His subject was "The Management of Diabetes"

Jefferson County

"Lesions of the Esophagus" was the topic of Dr Walter F Bugden, clinical associate professor of surgery, Syracuse University College of Medicine, when he spoke before the October 14 meeting of the Jefferson County Medical Society in Watertown

The postgraduate instruction was arranged by the Council Committee on Public Health and Education of the State Society, in cooperation with the State Health Department

Niagara County

The Tuberculosis and Health Association of Niagara County, in cooperation with the Niagara County Medical Society, has announced the beginning of a series of radio health broadcasts entitled "Why Do You Worry,' arranged through Station WHLD The first broadcast was held September 6, and the program will continue weekly for twelve weeks.

Onondaga County

Dr Leo M Taran, director, St. Francis Sanatorium for Cardiac Children, Roslyn, Long Island, addressed the meeting of the Onondaga County Medical Society October 5 in Syracuse on "The Treatment of Rheumatic Fever" The program was postgraduate instruction arranged by the State Society Committee on Public Health and Education with the cooperation of the State Department of Health.

Queens County

William L Laurence, science news editor for the New York *Times*, spoke on "The Promise of Atomic Energy in Human Welfare" at the joint meeting of the Queens County Medical Society and the Queensboro Tuberculosis and Health Association held September 28 in the Medical Society building.

On October 1, Dr Joseph H Siris, attending neurosurgeon at Flushing, Jamaica, and Brooklyn Jewish Hospitals and associate neurosurgeon at Queens General Hospital, spoke on "Ruptured Lumbar Disk and Sciatica" as a program arranged by the Society's Committee on Graduate Education

Richmond County

Postgraduate instruction arranged for the Richmond County Medical Society by the State Society with the cooperation of the State Health Department includes November 10—"Physiologic Studies of *Toxemias of Pregnancy*," Dr Howard C Taylor, Jr, professor of obstetrics and gynecology, Columbia University, College of Physicians and Surgeons, December 8—symposium on "Heart Disease and Pregnancy," Dr Edward P Maynard, Jr, professor of clinical medicine, Long Island College of Medicine, Brooklyn, and Dr J Thornton Wallace, clinical professor of obstetrics and gynecology, Long Island College of Medicine

The sessions are held at the Old Mill, Hyland Boulevard, Staten Island, beginning at 9 30 P M.

St Lawrence County

Dr Walter F Bugden, clinical associate professor of surgery at the Syracuse University College of Medicine, gave a talk on "Tumors of the Chest" at the meeting of the St. Lawrence County Medical Society held October 14 at Potsdam The postgraduate instruction was arranged by the Council Committee on Public Health and Education of the State Society with the cooperation of the State Department of Health

Schenectady County

Two programs of postgraduate instruction have been arranged for the Schenectady County Medical Society by the State Society Council Committee on Public Health and Education with the cooperation of the State Department of Health. On October 5, Dr Henry H Ritter, professor of clinical surgery at the New York Post-Graduate Medical School, spoke on "Fractures in General—The Treatment of Common Fractures" On November 2, Dr George P Heckel, assistant professor of obstetrics and gynecology at the University of Rochester School of Medicine and Dentistry, will speak on "The Practical Applications of Endocrines in Gynecology"

The meetings are held in the auditorium of the Eastern New York Orthopedic Hospital, at 8 30 P M.

Schoharie County

A series of programs of postgraduate instruction have been arranged for the Schoharie County Medical Society, to be held Tuesday afternoons at 4 00 P M at the Cobleskill High School, Cobleskill The programs were arranged by the State Society Council Committee on Public Health and Education with the cooperation of the State Department of Health.

Dates of the talks, with subjects and speakers, are

October 5—"Common Diseases of the Skin—Illustrated with Color Photography," Dr Leon H Griggs, professor of clinical medicine (dermatology and syphilology), Syracuse University College of Medicine

October 19—"Gynecology in General Practice," Dr Chester E Clark, professor of gynecology, Syracuse University College of Medicine

November 2—"Disabilities of the Foot and Ankle," Dr Richard S Farr, professor of orthopedic surgery, Syracuse University College of Medicine

November 16—"Rheumatic Fever," Dr Ethel G Cermak, assistant professor of pediatrics, Albany Medical College

November 30—"The Ophthalmoscope in the Diagnosis of General Disease," Dr Alfred Weintraub, instructor in ophthalmology, New York University College of Medicine

Sullivan County

Dr Paul A. Bunn, associate professor of medicine, Syracuse University College of Medicine, will speak on "Recent Advances in Therapy" at the meeting of the Sullivan County Medical Society, to be held Wednesday, November 17, at 8 30 P M at the Monticello Hospital, Monticello

The program is postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Society with the cooperation of the State Department of Health

Ulster County

At the meeting of the Ulster County Medical Society, held October 5 in Kingston, Dr Frederick W Williams, visiting physician at the Morrisania City Hospital, the Bronx, spoke on "Gangrene, Infection and the Management of the Surgical Diabetic" The program was postgraduate instruction arranged by the State Society's Council Committee on Public Health and Education with the cooperation of the State Department of Health

AS AN AID IN THE PREVENTION OF

Dental Caries

Strean-Tabs

"In a controlled study on several hundred children, the work done by Strean and Beaudet supports that a considerable decrease in the incidence of dental caries may be explained by the synergistic action between Vitamin C and D and Fluorine. The use of 1 Strean-Tab per day controls the amount of fluorine ingested"

(Excerpts from N.Y State J'l of Medicine—October 1945)

Accumulating evidence seems to confirm the value of **STREAN TABS** as an aid in the prevention of dental caries and the desensitization of sensitive teeth!

Clinical trials by Dr Strean on hundreds of children showed that those using tablets with his formula had an increase in caries rate attack of only 15% while the control groups not using the tablet had an increase of 65%

Descriptive literature and clinical samples are available on request by physicians, mail the coupon to us for a trial supply

Each Tablet contains:

Calcium fluoride	2.0 mg
Vitamin C (ascorbic cid)	30.0 mg
Vitamin D	400 I U U.S P XII
Oil of Peppermint	Q.S

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

To Hold Fall Executive Board Meeting

THE fall meeting of the Executive Board of the Woman's Auxiliary to the Medical Society of the State of New York will be held Monday and Tuesday, October 18 and 19, at the Hotel Syracuse, Syracuse, with the opening session on Monday afternoon at 1 30 P M A dinner will be held at 7 00 P.M , and on Tuesday there will be two meetings of the board, one at 9 30 A M , and the other following a luncheon at 12 30 P M The meeting will adjourn after the afternoon session

Program for the meeting calls for reports of the state officers, reports and recommendations of the district councilors and chairmen of standing and special committees, reports of the national convention, and a conference of county presidents

District Councilors are District 1—Mrs J Emerson Noll, District 2—Mrs Clifton L Dance, District 3—Mrs Albert VanderVeer, II, District 4—Mrs E M. Stanton, District 5—Mrs John L Mason, District 6—Mrs M M. Monserrate, District 7—Mrs Harry I Norton, and District 8—Mrs Arthur L Bennett

Mrs Edgar M Neptune, Syracuse, State Auxiliary president, will preside at the meeting

COUNTY NEWS

Albany County

The opening Executive Board meeting of the Albany County Woman's Auxiliary was held September 10 with a luncheon given by the president, Mrs Albert M Yunich Plans for the year were discussed, and a tentative outline of the year's program was presented The Auxiliary voted to continue its support of the Physicians' Home and the Red Cross, and to continue its service to the Albany Home for Incurables

The first regular meeting of the group was held September 22 at the home of Mrs Arthur J Sullivan, Albany, in the form of a "Decorators' Clinic," with Miss Dorothy Hinman, consultant decorator, as guest speaker

Cayuga County

The Cayuga County Woman's Auxiliary began its season with a dinner meeting at the Owasco Country Club on September 16, with Mrs Edward Pratt presiding, Program for the meeting was a panel discussion on "What Every Doctor's Wife Should Know," prepared by the State Auxiliary Legislative and Economics Committees

Plans were made to continue working on the project started last year, redecorating and refurnishing the Children's Convalescent Home in Auburn

Officers for the year are Mrs Pratt, president Mrs Charles T Yarington, first vice-president, Mrs Stephen J Karpenski, second vice-president Mrs G Perry Ross, corresponding secretary, Mrs Donald M Green, recording secretary, and Mrs Howard M Rapp, treasurer

Chautauqua County

The Chautauqua County Woman's Auxiliary, in cooperation with the Cancer Control Committee and the New York State Health Department, set up an exhibit at the Chautauqua County Fair at Dunkirk, September 6 to 11 Literature was distributed and questions were answered by members of the Auxiliary on cancer and its control Dr Julius Prince, district health officer, assisted the Auxiliary in this undertaking

The Auxiliary is continuing its Scholarship Loan Fund for the assistance of student nurses, and this fall the group is helping a girl who is beginning her training course, as well as assisting a second year student A gift from the Chautauqua County Medical Society was received to aid in this work

Dutchess County

The Dutchess County Woman's Auxiliary held an executive meeting at the home of the president, Mrs Albert A Rosenberg, Poughkeepsie, on September 8 Plans were made for the meetings of the coming year, and a luncheon meeting was outlined for October

Kings County

On September 14, Mrs Frederick Elliot was hostess for luncheon at her home for a meeting of the revision committee of the Kings County Woman's Auxiliary, when the bylaws of the Auxiliary were revised

The annual bridge party of the group is scheduled for October 19 At the first luncheon meeting, to be held November 9, Mr Thomas E Walsh, field representative of the Public Relations Bureau of the State Medical Society, and adviser to the auxiliaries, will be guest speaker At that meeting plans for the January and February activities will be presented

Oneida County

A luncheon for the wives of delegates to the annual meeting of the Fifth District Branch of the State Medical Society was held September 14 at the Jefferson County Golf Club in Watertown The Woman's Auxiliary of Oneida County was represented During a round table discussion following the luncheon, Mrs Arthur F Gaffney, Clinton, president of the Oneida Auxiliary, explained the

ANTIMALARIA DRUG EFFECTIVE IN TULAREMIA, UNDULANT FEVER

Atabrine, the drug which, developed in Germany, was the principal reliance for malaria control in the Pacific and Mediterranean theaters during the war, may be effective in controlling undulant fever and tularemia, a Vandalia, Illinois, physician reports

Writing in the *Illinois Medical Journal*, official publication of the Illinois State Medical Society, Dr D H Ecke, of Vandalia, and Dean H Ecke of the Illinois Natural History Survey, Urbana, described eight cases of tularemia and four cases of undulant fever which Dr Ecke successfully treated

Tularemia, which has become increasingly important in recent years, is usually transmitted to man from infected wild rabbits, while undulant fever, or brucellosis, is contracted either by handling diseased cattle, hogs, sheep, or goats, or eating unpasteurized dairy products from herds infected with contagious abortion or Bang's disease, as brucellosis is known in cattle

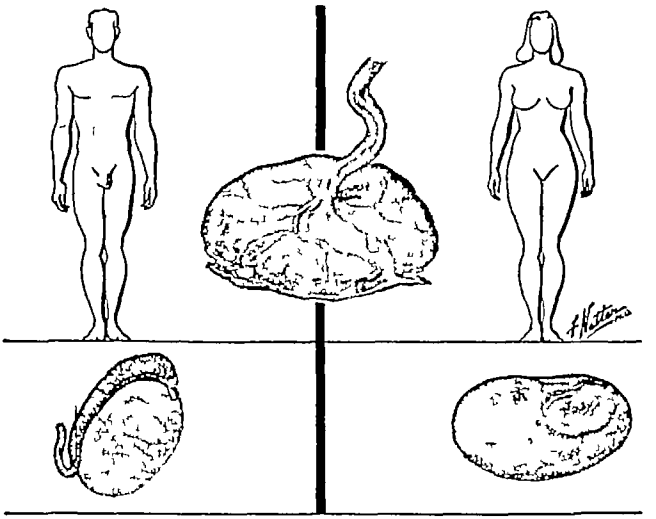
The tularemia cases included in the report were all treated up to April, 1948 Typical was a 65-year-old woman who, at the time of examination by Dr Ecke, was "suffering with fever and chills"

"She had an ulcer on her right thumb, and the lymph gland under her right arm was considerably enlarged and very tender," the report disclosed "These symptoms strongly suggested a case of ulcero-glandular tularemia

"Further inquiry brought out some important facts "She had dressed some freshly killed wild rabbits (cottontails) about three weeks previously—about a week before her illness started Two or three days after she had dressed the rabbits, a primary papule (sore) developed on the right thumb This papule would not heal and developed into the persistent ulcer noted above"

Dr Ecke prescribed atabrine to be taken three times daily for five days

"At the end of the fifth day, she reported back for examination," the report continued "She said that the chills and fever had left on the second day with no recurrence Examination showed lymph glands normal and the ulcer nearly healed, with no infection evident She has had no recurrence"



Similarly, the report stated, seven other patients were treated "who showed the typical symptoms of ulcero-glandular tularemia as described above Every case was traced to the handling of rabbits a few days before," the report added. "The characteristic chain of symptoms followed Without exception, atabrine produced a favorable response within one to three days and not one case required further treatment after the fifth day In none of these cases has there been a recurrence of symptoms"

Dr Ecke employed the same treatment in four undulant fever cases, diagnosis of which in three cases was confirmed by laboratory study of blood In these cases, all symptoms of undulant fever disappeared within five days after atabrine was started One patient relapsed after almost five years, but recovered after two or three days of atabrine treatment.

Although the organisms responsible for brucellosis, or undulant fever, have been known for more than sixty years, there has been no positive treatment for the disease The sulfa drugs and penicillin proved disappointing and so did streptomycin, although recently a combination of streptomycin and sulfadiazine has been reported successful Against tularemia, streptomycin has been much more successful However, the drug has its limitations It is expensive and it may produce unfavorable side reactions, such as damage to cranial nerves, causing loss of balance Also its continued use may produce a resistance against itself rendering it ineffective if needed at some later date

Commenting on the series of patients treated with atabrine for undulant fever and tularemia, Dr Ecke pointed out that "none of the patients were able to afford streptomycin nor was the drug available in most cases"

"Experimentation with atabrine has given us very favorable results in all cases of tularemia and undulant fever in which it was used," the report concluded "It is now a question of whether this treatment will give positive results when extensively used"

GONAD STIMULATION

IN THE MALE AND IN THE FEMALE

The action of chorionic gonadotropin clinically parallels that of the luteinizing hormone of the pituitary gland Chorionic Gonadotropin Armour available in lyophilized form is effective in both male and female where luteinizing hormone is indicated. Thus, it is of great value in the treatment of cryptorchidism and has been used successfully in the treatment of simple hypogonadism and hypogenitalism because of its true gonad stimulating effect. In the female it has been employed effectively in the treatment of functional uterine bleeding as well as in secondary amenorrhea, oligomenorrhea and hypo ovarianism where a deficiency of luteinizing hormone exists

Detailed literature will be sent gladly to physicians on request

Have confidence in the preparation you prescribe—specify

CHORIONIC GONADOTROPIN, *ARMOUR*

HOSPITAL NEWS

Lay Cornerstone for Cancer Hospital

CORNERSTONE-laying ceremonies for the six-story, 307-bed Francis Delafield Hospital for Cancer, 163rd Street and Fort Washington Avenue, New York City, were held September 1, with Mayor William O'Dwyer officiating The hospital will be affiliated with Columbia-Presbyterian Medical Center Dr Edward M Bernecker, commissioner of hospitals, presided at the ceremony

On recommendation of the faculty of the College of Physicians and Surgeons, Columbia University, the new hospital will memorialize Francis Delafield (1841–1915), distinguished New York pathologist and physician, who worked both at Bellevue Hospital and Columbia University

The hospital will have approximately 2,200,000 cubic feet of floor space, and its initial bed capacity of 307 beds may later be expanded It will include, in addition to facilities for deep therapy, radium therapy, chemotherapy, and ancillary services, three floors to house pathology, biochemistry, and bacteriology laboratories for routine hospital services, isotope storage and processing, and research

Regional Councils Approve Hospital Construction

APPROVAL of hospital construction and expansion project applications, for possible aid under the Federal Hospital Survey and Construction Act, has been voted by four of the regional councils of the New York State Hospital Planning and Survey Commission

Designed to provide hospitals in rural areas and urban sections with hospital needs, Public Law 725, the Hill-Burton Bill, by means of allotments to the states, allows Federal contributions of one third of the cost toward the construction or expansion of community hospitals The Hill-Burton Act allocates $2,900,000 each year for five years to New York State for assistance in expanding hospital facilities, with six million dollars now available to begin construction.

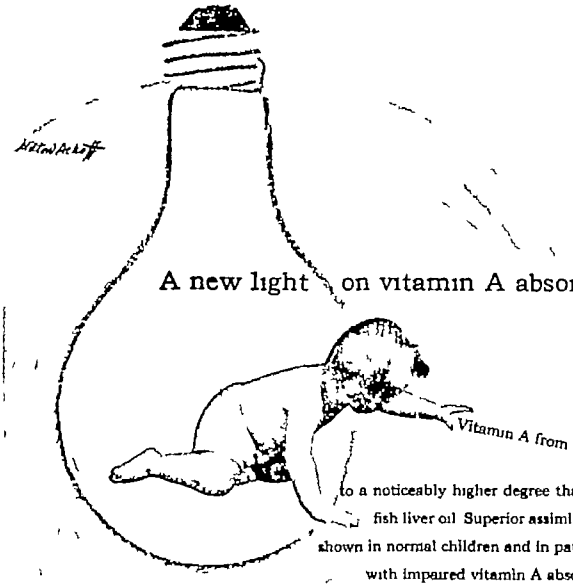
Recommendations forwarded by regional councils to the State Commission include

Albany Regional Hospital Planning Council—(1) A new 50-bed voluntary, nonprofit general hospital at Lake Placid, costing approximately $600,000, of which $200,000 would be Federal funds, (2) a new laboratory at the Fox Memorial Hospital in Oneonta, at a total cost of $60,000, of which $20,000 would be Federal funds, (3) a new 104-bed addition to the Hudson City Hospital, with reconstruction of existing facilities for service and administrative purposes at a total cost of $1,328,250, of which $442,750 would be Federal funds, and (4) a new 121-bed addition to the Albany Hospital, to provide much-needed facilities serving the entire region, providing beds for neurosurgery, thoracic surgery, plastic surgery, and other specialized types of work. The project would cost an estimated $3,292,000, with $1,097,083 to be in Federal funds

Rochester Regional Hospital Planning Council—(1) A new 100-bed hospital for Seneca County, estimated to cost $1,152,600, of which the Federal grant would be $384,200, (2) modernization and addition to the Dansville General Hospital, including new quarters for 36 of the hospital's 45 beds which are now unsuitably housed, and addition of 21 new beds, at an estimated cost of $560,326, toward which a Federal grant of $182,666 was asked, (3) addition to the Cuba Memorial Hospital, to add 31 beds to the present 19, at a cost of $197,000, of which $65,000 would be in Federal aid, and (4) new building and equipment for the Arnold Gregory Hospital, Albion, with construction of a 50-bed capacity building, to cost $480,900, for which Federal funds asked are $159,800

Syracuse Regional Hospital Planning Council—(1) The House of Good Samaritan, Watertown, (2) the Oswego Hospital, Oswego, (3) Oneida City Hospital, Oneida, (4) Lewis County General Hospital, Lowville, (5) Tioga County General Hospital, Waverly—all projects proposing additions to existing facilities, (6) Clifton-Fine Hospital, Star Lake, (7) E J Noble Hospital, Alexandria Bay, (8) E J Noble Hospital, Gouverneur, and (9) Hamilton Community Hospital, Hamilton.

Buffalo Regional Hospital Planning Council—(1) A complete, 50-bed hospital at Gowanda, (2) a 110-bed, 24-bassinet Genesee Memorial Hospital at Batavia, to include also a county laboratory with radiographic, clinical photography, blood bank, physiotherapy, and surgery departments, (3) a 100-bed St Jerome Hospital at Batavia and the remodeling of one wing of the present building into a 75-bed unit for chronic care use, (4) a 165-bed, 28-bassinet Christian Association Hospital at Jamestown, including plans for a fireproof building to replace the present main building, and a four-story addition, and (5) a 175-bed Jamestown General Hospital, with conversion of existing buildings to house municipal laboratories, the city health department, and outpatient clinics



Hospitals to Get Increased Payments

TO COUNTERACT inflated hospital expenses, Associated Hospital Service of New York will make extra payments of at least $2,500,000 in the next year to its 260 participating hospitals, with quarterly revisions in payments based on cost-of-living changes, it was announced recently

No rate increase will be made to Blue Cross members at this time, Louis H Pink, AHS president said However, he added, future rates "must be based on the experience and cost under this plan"

The new basic rates, put in effect September 1, increase average daily payments to hospitals from $12 47 to $13 71, plus additional payment for private rooms, from $13 58 to $14 59 for semiprivates, and from $10 01 to $12 for wards

To Train Volunteer Case Aides

THE United Hospital Fund of New York announced recently that it is receiving applications for trainees as Volunteer Case Aides in medical social service, with a preliminary meeting for the candidates held on September 28 at the Hotel Biltmore

The VCA classes, to last thirteen weeks, include two hours of class discussion each week at the Fund's headquarters, 8 East 41st Street, New York City, and five hours of training each week in a designated training hospital. In applying for training for VCA, candidates must pledge to serve in a hospital two hundred hours in the year following graduation

Dr Henry N Pratt, administrator at Memorial Hospital, addressed the preliminary meeting on "The Hospital's Need for Volunteer Case Aides"

Recommends General Hospital Care for Patient with Poliomyelitis

THE Hospital Council of Greater New York, in a recent issue of the *Bulletin*, pointed out that "The general hospital is the ideal place to care for the poliomyelitis patient, for it offers all of the various medical services and hospital facilities that are essential for the complete care of the patient, without hazard of infection to other patients or to hospital personnel.

"While statistics show that the incidence of infantile paralysis has been climbing upward during the past five years, it remains numerically an infrequent disease," the Council continued "Because polio hits suddenly, in widely separated areas—one year here, the following year there—and because in the public mind it is one of the most dreaded diseases," the Council emphasized that "the general hospital which prepares to offer adequate care to the patient with polio is offering an additional service to the community In turn this additional service," the Council pointed out, "will make the community more than ever aware of the value of its general hospital."

The Hospital Council cited the unit for patients with poliomyelitis at Knickerbocker Hospital in New York City as the type of service which might serve as an example to general hospitals wishing to offer this additional community service

It was pointed out that "The general hospital which anticipates offering the community services essential to polio patients probably will want to evaluate its program in advance of the usual polio season, June through September in the New York City area, in case of a polio epidemic next summer or any other summer"

Hospital Leaders to Study Finances

ALARMED by the financial crisis facing the voluntary hospitals of the nation, the American Hospital Association announced September 20 that it would sponsor a two-year study to determine present and future income prospects

The announcement was made at the opening of the fiftieth annual convention of the association, attended by 7,500 hospital trustees, administrators, and department heads from the United States, Canada, and foreign countries

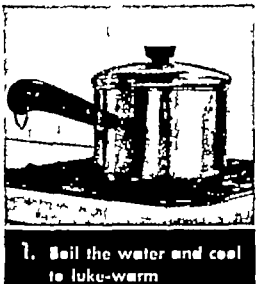
The study group, to be known as the Commission on Hospital Finance, will include 15 persons representing a cross section of the American public

The study is to be complementary to the one made by the Commission on Hospital Care, completed in 1946, which described the nature of services being provided by the hospitals and defined the pattern involving both facilities and type of service

The project will be conducted independently of the authority of the association, which will exercise no controls beyond those incorporated in the statement of purpose and scope

It is expected that funds for financing the study, estimated at $300,000, will be obtained from philanthropic foundations and individuals interested in health projects

Postgraduate Courses in Clinical Medicine



THE Mount Sinai Hospital, in affiliation with Columbia University, announces a Symposium in Internal Medicine to be given October 5 to December 7, 1948, and to be repeated January 24 to March 28, 1949 This Symposium may be taken in its entirety, or one or more of the ten courses may be taken separately in the following subjects cardiovascular, gastrointestinal, endocrinologic, venereal and skin diseases, diseases of the liver, kidney, chest, metabolism, as well as in hematology and allergy

Individual courses, varying in length, will be given from September 20, 1948, to June 28, 1949 Courses for general practitioners will be given in elementary and advanced electrocardiography, intensive gastroenterology, geriatrics, gynecology, bedside clinics in heart disease, clinical neurology, practical and advanced practical neuroanatomy and neuropathology, medical ophthalmology, ophthalmoscopy, pathology, pediatrics, physical medicine, physiology and psychiatry in general medicine

Individual courses for specialists will be given in anesthesia (nerve blocking), electroencephalography, ophthalmology (nine separate courses, including a four-week symposium), otolaryngology, nuclear physics and surgery of the gastrointestinal tract

Request for applications should be addressed to the Registrar for Medical Instruction, The Mount Sinai Hospital, Fifth Avenue and 100th Street, New York 29, New York.

[Continued on page 2302]

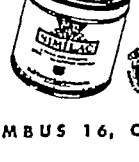
1. Boil the water and cool to luke-warm

2. Float measured powder on top of the water

3. Mix with a large spoon or fork

SIMILAC FEEDINGS ARE Easy TO PREPARE

It takes only 30 seconds to induce solution *if the powder is floated on top of the water* Lukewarm, boiled water is desirable.



No need to mix several ingredients—hence the possibility of errors in measurement is greatly reduced

The ratios of fat, sugar, and protein, *and the zero curd tension*, remain constant regardless of concentration Therefore, no gastrointestinal disturbance will normally occur, should the mother err occasionally in counting the number of measures of Similac powder

The level tablespoon measure in each can eliminates the possibility of underfeeding or overfeeding due to varying sizes of "tablespoons"

Result Similac reduces dietary disturbances traceable to mothers errors in preparation of the formula

SIMILAC a dependable food during the all-important first year

FINGERNAIL POLISH "BASE" DAMAGES WOMEN'S NAILS

A new medical mystery affecting women particularly was reported by Drs James H Mitchell, Douglas A MacFayden, and Bernard Jaffe, of the University of Illinois College of Medicine and Presbyterian Hospital in Chicago, to the A M A

Use of a "base coat" to make nail polish stay on longer has been causing strange damage to women's nails The fingernails turn purplish blue, then white, and begin to separate from the fingers As one physician facetiously put it, "The polish may stay on but the nails come off"

Whether the nails will recover and what causes the condition are unsolved mysteries The Chicago doctors saw their first case in February this year They have had reports of several hundred cases from doctors all over the country The most widely sold brand of base coat has, naturally, caused the greatest number of cases All brands probably are involved, since the trouble probably comes from a chemical ingredient used in all of them. So far, the ingredient has not been identified —*Science News Letter, July 3, 1948*

Findings from the Saratoga Spa records*

INHALATIONS

The results obtained in the treatment of 738 patients with inhalation at the New York State-owned Saratoga Spa show interesting tendencies

Marked relief of the condition treated was noted in 38 patients (5.2%), moderate relief in 468 patients (63.4%) temporary relief in 46 (6.4%) and no change in 185 (25%)

Conditions for which the treatments were given included sinusitis coryza, bronchitis chronic rhinitis, bronchial asthma, laryngitis, allergic rhinitis, hay fever and pharyngitis The treatments consisted of the inhalation of finely nebulized saline alkaline naturally carbonated mineral waters and medicated oils

The relief obtained bore a definite relation to the number of treatments taken In acute conditions from four to six treatments were necessary to obtain consistent improvement while in chronic conditions twelve to fifteen treatments were usually required

Inhalations are taken without discomfort which is an important factor in therapy

The safety of the therapy can be stressed Reactions of significance occurred in only three patients One patient may possibly have had a sensitivity to chlorenan one developed an acute asthmatic paroxysm and the third noted a general reaction to epinephrine

Attention to the general condition of the patients suffering from respiratory disorders is an important factor Inhalations have a definite place in the general "cure" regimen of a spa

** printed in the New York State Journal of Medicine, 44.1214 (June 1) 1944.*

The SARATOGA SPA

Physician Give Heed to Thine Own Health

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative "cure" at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that lie ahead.

For professional publications of the Spa, and physician's sample carton of bottled waters with their analyses, write W S. McClellan, M D., Medical Director Saratoga Spa, 155 Saratoga Springs, New York.

REVIEWED

The Doctor Discusses Morals By Winfield Scott Pugh, M D Octavo of 75 pages New York, William-Frederick Pr, 1946 Paper, $1 00, Cloth, $2 00

In this modest brochure, the author claims to discuss the question of morals from the viewpoint of the physician, psychologist, and anthropologist rather than from the religio-hysteric viewpoint of the moral reformer It would seem that morals and sex are interchangeable The doctor is not too strongly opinionated and tries to give his interpretation of morality

JOSEPH RAPHAEL

Rypins' Medical Licensure Examinations Topical Summaries, Questions, and Answers Containing for the First Time a Chapter on Psychiatry, Also Numerous Text Changes Throughout Incorporating Current Advances Edited by Walter L Bierring, M D Sixth edition With the collaboration of a review panel. Octavo of 690 pages Philadelphia, J B Lippincott Co, 1947 Cloth, $6 00

This volume is a brief, superficial review of certain important specialties, preclinical and clinical Its purpose is to prepare students for state board examinations There is a good deal of information scattered on every page It should continue to be popular with students

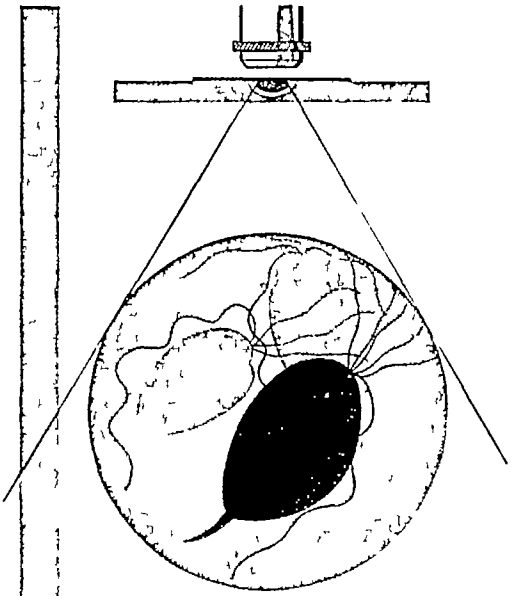
ANDREW BABEY

Probleme Des Selbstmordes By Fritz Schwarz, M D Octavo of 128 pages, illustrated. Bern, Switzerland, Medizinischer Verlag Hans Huber, New York, Grune & Stratton, 1946 Paper, 9 80 Sw Fr

This book contains a thorough statistical study of the incidence, causes, and technics of suicides, based mostly on Swiss data Suicide is presented as a murder case, where the murderer is the victim at the same time He might be mentally ill or mentally normal As far as prevention of suicides is concerned, the suggestion is made to create camouflaged institutions for the rescue of those who are weary of life The book is an excellent guide for medical laymen such as lawyers, sociologists, and ministers

MAX G BERLINER

Preoperative and Postoperative Care By William J Tourish, M D, and Frederick B Wagner, Jr, M D Octavo of 338 pages, illustrated Philadelphia, F A. Davis Co, 1947 Cloth, $6 00



The authors have compiled a readable book on a subject of much importance to both the patient and the operator The welfare of the patient and the success of the operation depend to a considerable degree on such care The contents of the book are grouped in seven chapters, of which four are devoted to pre- and postoperative surgical care. The remaining chapters are concerned with special conditions such as gynecology, neurology For reference, the book should be useful to all concerned with the care of surgical condition

STANLEY B THOMAS

History of the Medical Society of the County of Westchester 1797–1947 By the Medical Society of the County of Westchester, Laurance D Redway, Historian A Compilation from the Available Minutes of the Society and Various Contemporary Sources Octavo of 193 pages White Plains, New York, The Society, 1947 $2 50

[Continued on page 2308]

To combat the growth of pathogens in the vaginal secretions

The normal acid reaction of the vagina—a pH between 3 86 and 4 45—constitutes the chief natural defense against invasion of pathogens Massengill Powder by producing a pH of 3 5 to 4 5, thus counteracts the development of a more alkaline vaginal reaction which is favorable for the proliferation of trichomonas, monilia staphylococci streptococci and gonococci

Massengill Powder, presenting boric acid, ammonium alum berberine sulfate, phenol menthol thymol eucalyptol and aromatics is indicated in the management of trichomonas vaginitis cervicitis, and other vaginal infestations by pathogens It is a valuable adjuvant of proven efficacy in the treatment of leukorrhea, pruritus vulvae and nonspecific vaginitis Its cleansing and deodorizing properties are also widely appreciated by the patient.

Available in 3 oz 6 oz 1 lb and 5 lb jars

County medical societies throughout the United States will greatly profit from the example and history as presented in this book of one of America's outstanding and progressive group of medical men The factual data and biographies set forth most interesting reading There are few societies that have the experience of 150 years behind them, as has Westchester Dr Laurance D Redway, historian, an outstanding physician in his community, deserves great credit for the clearness and detail in this work Those members of the profession who are interested in the history of medicine would profit from the study of this book.

THOMAS B WOOD

Sexual Behavior in the Human Male By Alfred C Kinsey, Sc D, Wardell B Pomeroy, and Clyde E Martin Octavo of 804 pages, illustrated Philadelphia, W B Saunders Co, 1948 Cloth, $6 50

The Kinsey report is one of the most important books, medical or otherwise, published in America in the past decade, it will certainly influence social attitudes more than any other

Anyone knows it is a study of the sexual habits of American men, prepared by three scientists at the University of Indiana after years of research The prurient will find little of interest in its pages, which are taken up with numerous tables, meticulously prepared, with careful and impartial summaries noncontroversially presented It would not have seemed likely in advance that the questionnaire method used by the authors would be successful, but the report is thoroughly convincing on this score In retrospect, it seems almost the only method which could be used with the subject and the material, but it needed people like Kinsey and his associates to assure scientific accuracy

The inevitable defect in any study of this sort is the error in sampling, an error which will be minimized as the project proceeds Changes in the statistics will doubtless occur, but the essential validity can scarcely be challenged Everyone concerned should start thinking along altered directions at once This will include everyone who must start with the facts of human behavior as major premises doctors, psychiatrists, teachers, sociologists, judges, penologists, and—the most important group—parents in general Doctors will find in the book some things of immediate clinical application, such as the sensible comments on ejaculatio precox on page 580, which may be read by any patient

I cannot believe but that this study will not at some point shock everyone who reads it The point and degree of internal disturbance will vary with the reader Disturbing as it may be, a study of this kind provides grounds for optimism and hope The first step in any self-improvement starts with a good look in the mirror, which we, as a nation, should not be afraid to take If we are a nation bedevilled by phobias, repressions, and guilt feelings, this book provides the first step in the outcasting of these devils Kinsey brings light into darkness and, as usual, light in turn brings understanding, compassion, and remedial measures

Many questions are raised of course, all of which will urgently require answers The differences between our sex patterns and those of other countries must be studied and their causes discovered Geoffrey Gorer points out, and I see no reason to doubt him, that "petting to climax" is peculiarly American A knowledge of this fact and that kissing between the sexes is now the equivalent of a handshake will profoundly shake many people But all of us, especially parents, should face these, if they are true One may regard them as mass titillation, probably sinister in effect, or as a substitute for worse possibilities, but one must reckon on the phenomena as realities in our civilization To this reviewer, it seems to be that this devaluation of a phase of human relations, however inevitable or necessary, comes close to representing the debasement of an ultimate coin

M PLOTZ

Physical Medicine in General Practice By William Bierman, M D Second edition With a chapter on Medical Rehabilitation by Dr Sidney Licht Octavo of 686 pages, illustrated New York, Paul B Hoeber, 1947 Cloth, $8 00

In this edition the author has included newer developments in the use of penicillin and fever therapy in the treatment of syphilis and also new therapy of early ambulation A new chapter in rehabilitation by Dr Sidney Licht has been incorporated

Primarily intended for the general practitioner, it is also of benefit to the specialized services where the modalities of physical medicine may be used, as he divides many of his chapters into treatment by systems such as cardiovascular, genitourinary, etc

JOHN J HAUFF

The Rotunda Hospital, 1745–1945 By O'Donel T D Browne, M B (Ireland) Octavo of 296 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $11

On March 15, 1745, Bartholomew Mosse opened the Dublin Lying-in Hospital for poor women in George's Lane In July, 1947 (due to war conditions in 1945) the two hundredth anniversary of that momentous event was celebrated with the present Rotunda Hospital in Dublin the center of attraction This volume is the first detailed account of the purely professional work accomplished during all these years and the relation of this work to the history and advancement of obstetrics throughout the world

Dr O'Donel Browne of Dublin has done a magnificent job—accurate, meticulous, fair, entertaining Anyone interested in the history of maternity hospitals or obstetrics will find this volume most interesting and highly educational Of its type, it is easily a book-of-the-month selection and therefore a valuable addition to any library

HENRY B MATTHEWS

Diseases of the Chest. With Emphasis on X-ray Diagnosis. By Eli H Rubin, M D With a Section on "The Principles of Surgical Treatment" By Morris Rubin, M D Quarto of 685 pages, illustrated Philadelphia, W B Saunders Co, 1947 Cloth, $12

The authors and the medical public alike are to be congratulated on the publication of this volume After a splendid summary of x-ray procedures, the acute and chronic pneumonias are discussed, with a special chapter on viral lung infections

Then, in turn, are presented chapters on lung abscess, tuberculosis (158 pages), pneumoconiosis, bronchial obstruction, bronchiectasis, emphysema, cysts, asthma, neoplasms, mediastinal disease, pleural effusion, pneumothorax and heart-lung disease References are numerous and up to date There are many excellent photos and x-ray studies, along with twenty-four plates in color by Frank Netter

A finer book on chest diseases has never come to this reviewer's desk FRANK B CROSS

Aerosol Inhalation Therapy

GREATLY SIMPLIFIED WITH

SOLUBLE TABLETS

CRYSTALLINE PENICILLIN G POTASSIUM

Each foil wrapped tablet contains 50 000 units, the usual single dose

The tablet is simply dropped into the nebulizer

10 to 15 minims of water or saline solution are added with a dropper

and the prescribed dose is ready for administration.

Aerosol inhalation therapy in the home is rendered exceedingly simple when Soluble Tablets Crystalline Penicillin G Potassium are prescribed Each tablet contains 50 000 units of penicillin, the usual single dose, and is entirely free of binder or excipient The tablet is simply dropped into the nebulizer, 10 to 15 minims of water or saline solution are added, and the patient can then receive the treatment Thus the need for first dissolving the penicillin and then measuring the required dose is obviated entirely Soluble Tablets Crystalline Penicillin G Potassium dissolve rapidly with slight agitation Available on prescription at all pharmacies in boxes of 24 each tablet individually wrapped in foil

for liver damage **MEONINE®**

(dl methionine Wyeth)

IMPORTANT WYETH ADDITION TO *New and Nonofficial Remedies*

Realizing that traditional management of severe liver disease has been on the whole disheartening Wyeth has for years been conducting research on the essential amino acid most concerned with liver function

dl-methionine

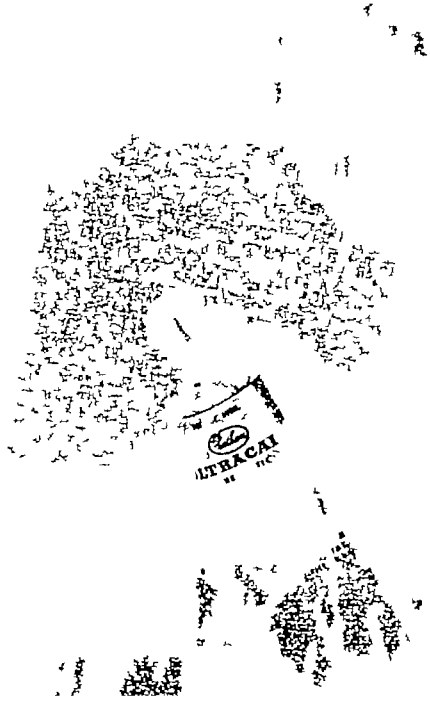
Product of this research is Meonine.

Meonine may be used to supplement the protein-rich diet usually prescribed whenever the liver has been damaged by malnutrition alcoholism pregnancy allergy or toxins. And it is clearly indicated if this diet cannot be taken. There is no evidence, however that Meonine is more effective than foodstuffs such as casein and egg white which contain pure methionine

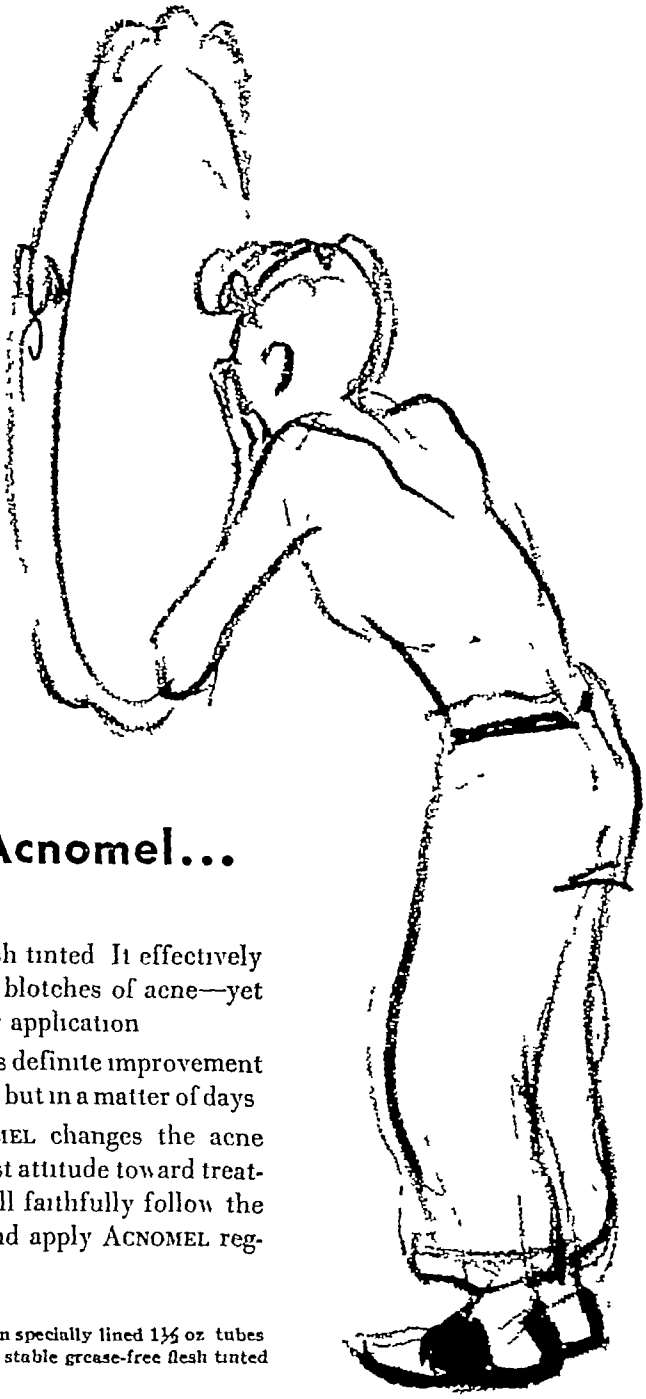
In early stages of cirrhosis, clinical results with Meonine have been most encouraging Complete directions for use and bibliography supplied on request.

Wyeth

Meonine supplied in 0.5 gram tablets, bottles of 100 and 1000 Crystalline Meonine—for preparing i fection solutions—supplied in 50 gram bottles



WYETH INCORPORATED PHILADELPHIA 3, PA



Pure..
Wholesome..
Refreshing

Safeguarded constantly by scientific tests, Coca-Cola is famous for its purity and wholesomeness. It's famous, too, for the thrill of its taste and for the happy after-sense of complete refreshment it always brings. Get a Coca-Cola, and get the feel of refreshment.

The pause that refreshes

Your acne patient

cooperates

when you prescribe Acnomel...

Because ACNOMEL is delicately flesh tinted It effectively masks the blemishes and blotches of acne—yet is virtually invisible after application

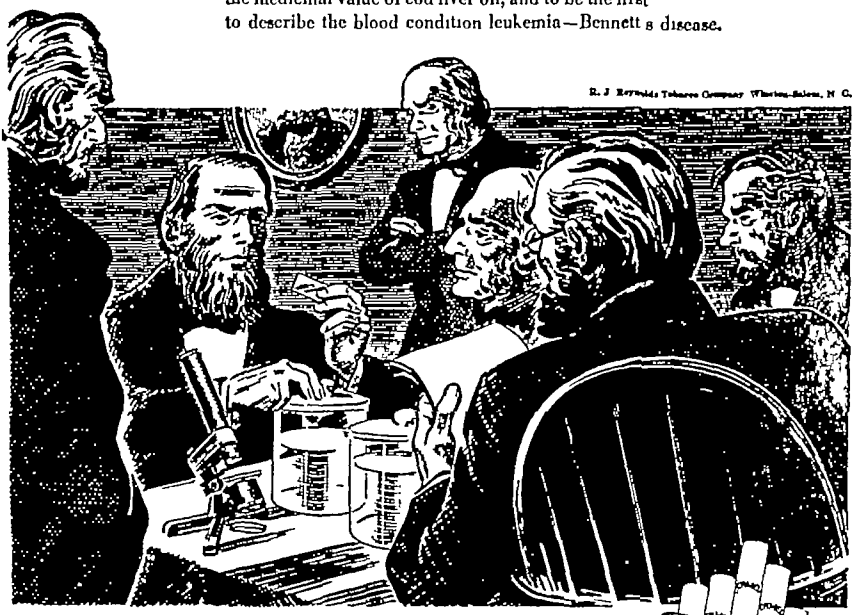
ACNOMEL ordinarily brings definite improvement —not in months or weeks, but in a matter of days

Thus, the use of ACNOMEL changes the acne patient's typically defeatist attitude toward treatment Encouraged, he will faithfully follow the regimen you prescribe and apply ACNOMEL regularly, as you direct

Available, on prescription only in specially lined 1½ oz tubes Resorcinol 2% sulfur, 8% in a stable grease-free flesh tinted vehicle

Smith, Kline & French Laboratories, Philadelphia

Acnomel



a significant advance, clinical and cosmetic,

in acne therapy

Experience is the Best Teacher

JOHN HUGHES BENNETT (1812-1875) proved it in histology

Bennett's experiences gained by linking physiology with clinical medicine, led him to institute the practical study of histology to recognize the medicinal value of cod liver oil, and to be the first to describe the blood condition leukemia—Bennett's disease.

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

Experience is the best teacher in cigarettes, too!

YES! Millions of smokers who have tried and compared many different brands of cigarettes found from experience that cool full flavored Camels suit them best.

Try Camels! See how the full, rich flavor of Camel's choice, properly aged and expertly blended tobaccos *pleases your taste*. See if Camel's cool mildness isn't mighty welcome to your throat.

Yes! Let your taste and throat tell you why with millions of smokers who have tried and compared Camels are the "choice of experience."

According to a Nationwide survey:

More Doctors Smoke CAMELS

than any other cigarette

In a nationwide survey by three independent research organizations, 113,597 doctors were

Heptuna with Folic Acid

HEPTUNA with FOLIC ACID—the most modern approach to the treatment of hypochromic and many of the hypoplastic anemias furnishes

- FOLIC ACID to stimulate the hemopoietic tissues to greater activity
- Ferrous Sulfate the most readily available form of iron for hemoglobin regeneration
- Essential Vitamins needed for general well being and optimal cellular metabolism.

HEPTUNA with FOLIC ACID not only furnishes the structural elements needed for hemoglobin and cellular regeneration but, in addition stimulates the hemopoietic tissues to better utilize these elements and more rapidly correct the existing anemia.

a ROERIG *preparation*

EACH CAPSULE CONTAINS:

Folic Acid	1.7 mg
Ferrous Sulfate U.S.P.	4.5 Grains
Vitamin A (Fish-Liver Oil)	5,000 U.S.P. Units
Vitamin D (Tuna-Liver Oil)	500 U.S.P. Units
Vitamin B_1 (Thiamine Hydrochloride)	2 mg
Vitamin B_2 (Riboflavin)	2 mg
Vitamin B_6 (Pyridoxine Hydrochloride)	0.1 mg
Calcium Pantothenate	0.333 mg
Niacinamide	10 mg

good augury in pregnancy

For too long, enchantments and incantations were the only defense against spontaneous abortion. Now however prophylactic therapy has been placed on a rational basis with the discovery that the corpus luteum hormone is "a powerful uterine relaxant as well as being "essential to embedding of the ovum."[1] Clinical evidence has now accumulated which indicates that at least 8 out of 10 habitual aborters may be delivered of viable infants if PROLUTON® pure progesterone is injected routinely early in pregnancy.[2-4]

PROLUTON

(PROGESTERONE U.S.P. XIII)

Being so effective in controlling uterine motility PROLUTON is invaluable, too when abortion is imminent. Thus used in large dosage PROLUTON has assured continuance of pregnancy after what seemed inevitable abortion.[5]

DOSAGE:

Habitual Abortion PROLUTON 5 to 10 mg. three times weekly; 25 mg. PROLUTON during calculated menstrual periods and time of term.

Threatened Abortion PROLUTON 5 to 25 mg. daily until symptoms cease; then treat for habitual abortion.

PACKAGING:

PROLUTON (Progesterone U.S.P. XIII) in ampul of 1, 2, 5 or 10 mg.; in boxes of 3, 6 and 50 ampuls. Multiple dose vials of 10 cc., 10 or 25 mg. per cc.; box of 1 vial.

Effective **AGAINST**

NOW AVAILABLE FOR CLINICAL USE

BACITRACIN

A *New* ANTIBIOTIC

- FOR LOCAL INFILTRATION
- FOR TOPICAL APPLICATION TO SKIN AND EYES

CSC

A WIDE RANGE OF
Pathogenic Organisms

Bacitracin, the newest antibiotic available for clinical use, affords a potent weapon for the treatment of many pyogenic infections of the skin and superficial eye infections Available in dry powder form for preparation of solutions for local instillation and irrigation, as an ointment for cutaneous application, and as an ophthalmic ointment, it offers the following important advantages

- Effective against a wide range of organisms—gram positive pathogens, streptococci and staphylococci
- Destructive to many strains of pathogens resistant to penicillin
- Extremely low index of allergenicity on topical application
- Promptly efficacious in furuncle, infected skin ulcer, osteomyelitis, infectious dermatitis, impetigo infected wounds, and other cutaneous infections due to Bacitracin-sensitive pyogens.
- Bacitracin Ointment has also been found effective in ecthyma, folliculitis, pyoderma decubitus, infectious eczematoid dermatitis and secondarily infected eczema scabies, etc, when due to Bacitracin-sensitive organisms.
- Equally effective in many ocular infections—conjunctivitis, meibomitis, blepharoconjunctivitis, keratitis, dacryocystitis, corneal ulcer, marginal ulcer when due to Bacitracin sensitive organisms.

Bacitracin is supplied in 20 cc rubber-stoppered vials containing 2,000 and 10,000 units, and in 50 cc rubber-stoppered vials of 50,000 units, Bacitracin Ophthalmic Ointment C S C is available in ⅛ ounce tubes, Bacitracin Ointment-C S C (for cutaneous application), in ¼ ounce tubes Both ointments provide 500 units of Bacitracin per gram Literature available to physicians on request

For Head Colds, Crusts, Dryness of the Nose and Other Nasal Conditions

OLIODIN (2 fl oz)

(De Leoton Nasal Oil)

OLIODIN produces a mild hyperemia with an exudate of serum, loosening crusts relieving dryness and is soothing to the nose and throat. Breathing is improved

Try OLIODIN in connection with forms of treatment you may be using in the nose, such as tamponage sprays etc. and note the improvement.

For The Eyes

OPHTHALMIC Solution No. 2

½ fl oz—2 fl oz

(De Leoton Eye Drops)

Sol Oxycyanide of Mercury with Zinc Sulphate, Zinc Phenolsulphonate and Boric Acid in Distilled Water

USES
1. In Diplo-bacillus infections.
2. Before and after operations.
3. In chronic catarrhal conditions of elderly people.
4. As a collyrium (Eye Wash)
5. To relieve irritation caused by wind dust, bright lights etc.

Local penicillin reduced intranasal bacteria 99%

Proceedings of the Society of American Bacteriologists
47th general meeting May 13 17 1947

A series of patients was treated intranasally with local penicillin, *500 units per cc*, for 5 consecutive days At the end of this time, the bacteria count was reduced from an average of 7,363 per cc of nasal washings to the amazingly low average of 42

In Par Pen you have a preparation that combines the potent antibacterial action of penicillin, *500 units per cc*, with the rapid and prolonged vasoconstriction of Paredrine Aqueous'

For sample and full information, write Par Pen on your prescription blank and mail it to us at 429 Arch St., Philadelphia 5, Penna.

Par-Pen

the penicillin vasoconstrictor combination for intranasal use

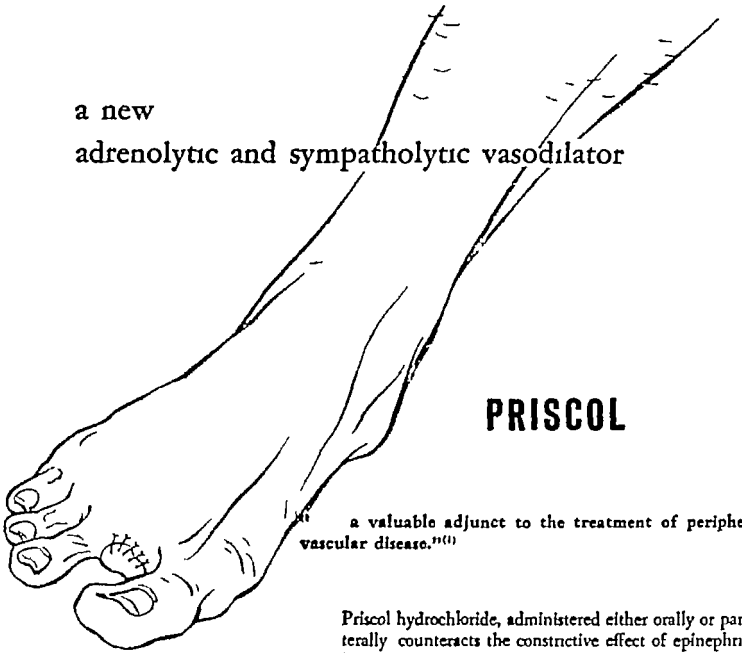
Smith, Kline & French Laboratories, Philadelphia

GOOD!... *for children of all ages*

Want a potent multivitamin preparation that looks, smells and tastes good? Have you tried the honey colored liquid preparation with the citrus like flavor and odor? It's Vi Daylin, Abbott's homogenized mixture of vitamins A, D, B_1, B_2, C and Nicotinamide It pleases the most fastidious patient

Taken from the spoon or easily mixed with cereal, milk or juices, one small daily dose of Vi Daylin provides the high concentration of vitamins necessary to meet the nutritional requirements of infants and children Finicky oldsters find that the slightly larger dose they require goes down very pleasantly

Vi Daylin is stable at room temperature, has no fishy odor At pharmacies everywhere—in bottles of 90 cc , 8 fluidounces and 1 pint ABBOTT LABORATORIES, North Chicago, Illinois



Each 5-cc. teaspoonful of Vi Daylin contains	
Vitamin A	3000 units
Vitamin D	800 units
Thiamine Hydrochloride	1.5 mg
Riboflavin	1.2 mg
Ascorbic Acid	40 mg.
Nicotinamide	10 mg

Contains not more than 0.5 percent alcohol

PRISCOL

"a valuable adjunct to the treatment of peripheral vascular disease."[1]

Priscol hydrochloride, administered either orally or parenterally counteracts the constrictive effect of epinephrine-like substances which are formed at the vascular myoneural junction

Priscol therefore produces circulatory improvement in many cases of Raynaud's disease Buerger's disease, diabetic gangrene, and arteriosclerotic peripheral vascular disease.

Patients should be closely observed until optimal dosage is established since paradoxical effects or orthostatic hypotension may occur

Issued: Tablets of 25 mg; bottles of 100 and 1000
10 cc. Multiple-dose Vials, each cc containing 25 mg.

SKF now offers 2 unusually palatable

fluid sulfonamide preparations

new!

Eskadiamer

a *combination* fluid sulfonamide containing equal parts of sulfamerazine and sulfadiazine Each 5 cc (one teaspoonful) contains 0 25 Gm (3 86 gr) sulfamerazine and 0 25 Gm (3 86 gr) sulfadiazine

Eskadiazine

the widely-prescribed fluid sulfadiazine Absorbed much more rapidly than sulfadiazine tablets Each 5 cc (one teaspoonful) contains 0 5 Gm (7 7 gr) sulfadiazine

These pleasant-tasting preparations may be prescribed whenever oral dosage of the sulfonamides is indicated

Children, particularly, like ESKADIAMER and ESKADIAZINE And busy mothers are spared the chore of crushing bulky tablets and coaxing a sick child to swallow an unappetizing mixture

Smith, Kline & French Laboratories, Philadelphia

excursion into logic

Quae cum ita sint (And since this is so)

Premise No 1: Progesterone products administered during pregnancy inhibit protection and utilization of endogenous progesterone, as indicated by diminished pregnanediol excretion, while estrogens have the opposite effect of stimulating production and utilization of progesterone (Smith Smith and Hurwitz[1], Meaker[2])

Premise No 2 Exogenous progesterone, even in combination with estrogens, frequently sensitize the myometrium to contractile action of posterior pituitary oxytocin actually contributing toward abortion and premature delivery (Bender[3], Vaux and Rakoff[4])

Premise No 3: High dosage stilbestrol therapy gives higher percentage of protection of pregnancy in threatened and habitual abortion and in premature delivery than any method previously employed (Karnaky[5] Rosenblum and Melinkoff[6])

Conclusion Therefore, **des,** 25 mg tablets of triply crystallized Grant process diethylstilbestrol, is the logical product for use in habitual and threatened abortion, pre-eclampsia, eclampsia, premature labor and other accidents of pregnancy referrable to hormone deficiency

guard against kidney damage . .

SULFADIAZINE WITH SODIUM LACTATE — MRT

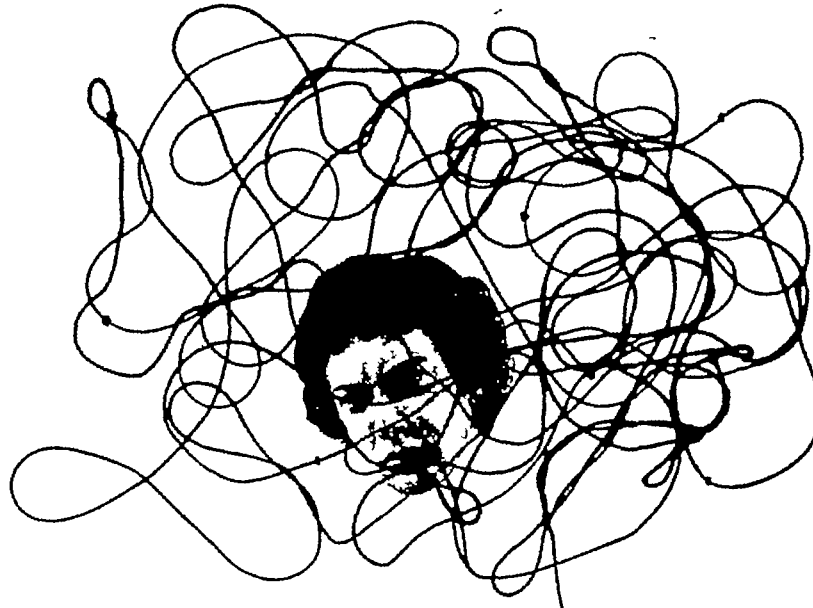
In Sulfadiazine with Sodium Lactate-MRT the physician may be sure that the principle dangers of sulfonamide therapy — crystalluria and urolithiasis — are absolutely minimized.

Sulfadiazine with Sodium Lactate-MRT raises the pH of the urine to increase the solubility of the excreted sulfonamide and its conjugates Prevention of crystal formation is insured.

Pleasant taste assures maximum patient cooperation in both adults and children

One teaspoonful (5 cc.) of Sulfadiazine with Sodium Lactate-MRT contains 7.7 grains (0.5 Gm.) of sulfadiazine — the amount contained in the 0.5 Gm. tablet plus sodium lactate in a full 3 to 1 ratio

no coined names specify



MRT

2 new SULFONAMIDE SUSPENSIONS

for simplified, safer therapy

CREMOMERAZINE®

CREMODIAZINE®

Each 3.0 Gm./30 cc. (1 fl. oz.)

These new Sharp & Dohme preparations provide sulfamerazine and sulfadiazine, in pleasantly flavored, easily administered 10% suspensions The drugs are evenly dispersed in a very fine state of subdivision and are, therefore, rapidly absorbed

Used Separately, CREMOMERAZINE and CREMODIAZINE are therapeutically equivalent, but the total dose of CREMOMERAZINE is only one-half that of CREMODIAZINE Moreover, the dose interval of CREMOMERAZINE (8 hours) is twice that of CREMODIAZINE, a distinct advantage when the patient must not be disturbed.

Used Together, CREMOMERAZINE and CREMODIAZINE are less likely to produce crystalluria or renal obstruction than either separately, and may be administered, in the majority of instances, without adjuvant alkalies, each drug being prescribed in half the usual amount Lehr reports that such combination dosage eliminates renal complications and greatly reduces overall *sulfonamide toxicity*

CREMOMERAZINE and CREMODIAZINE are 10% suspensions containing 5% alcohol and are supplied in pint bottles

Vulnerability of Hospitals

News stories recently in the daily press have told of the moving of an aircraft manufacturing plant from Connecticut to Texas, and of the recent building of underground plant facilities, as a part of the realistic national security program While these changes relate to manufacturing plants and anticipate the possibilities of the use of the newer atomic weapons, the question naturally arises What of medical institutions in high risk areas? In the State of New York this question would seem to be of particular validity where, in numerous places, consolidation of hospital, teaching and outpatient facilities has resulted in towering structures This centralization, with its dependence upon uninterrupted flow of power, supplies of all kinds, medical and nursing personnel, and particularly of transportation, is surely highly vulnerable

While industrial installations can be moved and time permitting, be operated underground, the medical centers existing at present serve the imperative daily needs of vast populations To do this they must run uninterruptedly day and night to full capacity Local disasters in previous times occasionally have been of considerable magnitude but there have been available all the medical resources and facilities necessary to deal quickly with them

Contamination of supplies and personnel on a large scale either by poison gas or radioactivity, in addition to demolition has not been encountered domestically Medical aid and continuity of medical service have been freely available.

The evolution of modern warfare increasingly has involved civilian populations European experience with the wartime destruction of installations and disruption of facilities has been far more intimate than ours, which has been practically nil How long will we be so fortunate? And as far as New York State is concerned, what provision can be made to anticipate the possible early loss of such medical facilities in high risk areas in the event of attack? Presumably any future aggression would come without warning

Since present facilities and such additional building as has been previously authorized will be dedicated to the maintenance of ordinary peacetime service, any special provisions to meet war conditions would have to be in addition to present extension of surface planning Little discussion of such plans has been heard Should more attention be given by medical men to this phase of a future wartime problem? Its complexity and difficulty would seem to warrant it

Current Editorial Comment

Expert Testimony On the subject of teachers of medicine, two categories have developed the practical and the cloistered Some have considered the cloistered teacher not to the best interest of the profession For example

> Thomas Lewis clearly foresaw such a danger and warned against it, but it is clear that the presence in the modern medical school of two categories of teacher, the practicing consultant and the salaried academic teacher, opens the door to this disastrous dichotomy The practicing teacher is familiar in his everyday work with the individuals seen against the backgrounds of his home, his family, and his work. The full tide of human needs and distresses bears down upon him daily, and the arts and technics of medicine are his constant and exhausting preoccupation He may cease to look beyond them
>
> For the cloistered academic teacher, life is different He gets his patients washed and tidied and laid out in rows in hospital wards, their importunate and exacting wives and mothers-in-law do not intrude upon his profound cogitations No unpleasant smells or noises break in on his ordered eloquence, house physicians and nurses wait on his bidding and tremble at his voice, and all those seeming irrelevances, so necessary to the balanced comprehension of the patient's total situation, are carefully tidied away out of his sight He does not miss them, for he has never known them He is rather like the florist who can arrange the plucked blooms, from which the dead leaves and the dirty roots have been removed and the earwigs shaken off, into all the combinations of form and colour his fancy dictates [1]

Lest some may have missed seeing the above through inadvertence, we call attention to it again as an example of courageous criticism of present day medical education from an English author It would appear to be a warning of general applicability and considerable seriousness The contact of the salaried, academic teacher of medicine with the student body is early, close, and precise Unquestionably he has a function to fulfill in the modern development of medicine, both in its undergraduate and graduate instruction The matter is one of proportion The practicing physician or consultant has a teaching function perhaps even more invaluable, as Thomas Lewis indicates Applied medicine seems still to be the ultimate goal of the profession Should not the young doctor be so instructed?

It gives us great pleasure to reinforce the verdict of the British author—and our own—by a quotation from Dr F C Shattuck He speaks of Sir William Osler, universally conceded to have been the great teacher of his day Oddly enough, the quotation appears as the foreword to the second volume of Dr Harvey Cushing's *Life of Sir William Osler* [2] Possibly Dr Cushing was responsible as much as any man in this country for taking the teaching of medicine out of the world, where Sir William kept it as a living subject, and putting it in the cloister, in the hands of full-time professors, where it becomes daily more attentuated and anemic

> To no member of its body today does the profession of medicine owe so great a debt—not that humanity is not also deeply in his debt Jenner or Pasteur has his first mortgage on mankind, his second on men of medicine With Osler the order is reversed *He has made no profound or fundamental discovery* (the italics are ours), but no one of our day, in his life, teaching, and example, so radiated, far and near, an inspiration to his fellow physicians Wide and accurate learning, enthusiasm in the pursuit of truth, a character in

[1] Walshe F M R Teachers of Medicine Lancet 2 817 (Dec 6) 1947 As quoted in J A M A 137 1190 (July 31) 1948

[2] Cushing Harvey Life of Sir William Osler Foreword to Vol 2 Oxford at the Clarendon Press 1925

which elevation and charm are singularly marked and rarely blended a personality which wins perforce the love, admiration, and respect of all who come within his influence a kindly eye which sees the good in every man and thus stimulates him to better it—these are the threads woven into the fabric of his beautiful life. Who that meets him, who that reads his essays and addresses, in particular, does not come forth or rise with renewed strength and hope to the service of his fellow man, a better soldier in the medical corps of the Divine army?[2]

100,000,000 Volt X-Rays Experiments with 100,000,000 volt x rays on a "phantom" patient indicate that these high voltage x-rays, produced by the betatron, may prove of great value in cancer therapy because of their high penetrating power and lower surface absorption as they pass into matter

The experiments were carried out at the General Electric Laboratories by Dr Ernest E Charlton, head of the x-ray section, and H E Breed, and are described in the current issue of *The American Journal of Roentgenology and Radium Therapy*

The tests revealed, the report states, that the depth of maximum absorption of the rays, where they have most effect, increases with voltage At about 2,000,000 volts the maximum depth of absorption was found to be less than half an inch below the surface At 20,000 000 volts it is about an inch, at 50,000,000 nearly three inches, and with 100 000,000 volts it is four inches

The construction of a special 5,000,000 volt medical betatron was announced recently by the G E Research Laboratory [1]

With penetration of this order and relatively low surface absorption, cancer and other research should be materially assisted With the likelihood of more machines and even higher voltage operation being shortly in use, recent warnings about the hazards of x-rays are pointed up [2] Particular attention should be paid by the medical profession to available literature concerning precautions to be taken, not only with respect to x radiation and its use in fluoroscopy, but also regarding radium radium emanations and radioactive isotopes

Have Your Cake A few days ago we received an advertisement from a reputable drug firm Its wording was so subtle, so insidiously attractive that with a shudder we threw it in the waste basket It recalled memories of Moose McCormick, who told us that when he went on trench raids his favorite weapon was a baseball bat "It's handy," he explained simply "I know how to use it, and besides, I'm afraid of firearms"

So are we And afraid of drugs But since that advertisement hit the bottom of the waste basket our subconscious mind has been at work. The two main components of the miracle tablets advertised were benzedrine and phenobarbital Benzedrine *peps you up It is practically the nearest* approach to a true intellectual stimulant since cocaine Phenobarbital soothes the nerves, when worries are at work, when in the early hours of the morning the brain will not relax When you toss from one side of the pillow to the other, when your wife gets up and goes to sleep upon the living room sofa, what is needed then? Why a little phenobarbital, of course

We are no pharmacist, but the action of the preparation must be something like this. The benzedrine acts at once Assume you are going to a party No sooner have you crossed your host's threshold than your brain begins to scintillate and snap After a few hours of intellectual electricity, your system begins to feel the need of sleep Then it is that the phenobarbital, doubtless through delayed absorption capsules, begins to seep insidiously into the chinks of your supercharged intellect You yield to your wife's entreaties and go home No sooner does your head touch the pillow than off you go into a dreamless slumber, to wake the next morning as fresh as if your brain had never been overstimulated by benzedrine, nor lulled into lethargy by phenobarbital

It sounds wonderful doesn't it? But if you have a bit of earthy skepticism left, will you resist the enticement of the advertiser's words? Will some trace of conscience—that hideously outmoded word—rise from your subconscious mind to tell you that eventually you pay for what you get? That there is no intoxication without its hangover?

We are glad we have forgotten the name of those tablets They pander to one of the most sinister proclivities of this precarious generation

The President's Page

Disaster Preparedness

IN THE absence of any certain guarantee of peace, the medical profession, necessarily realistic, must contemplate its obligation to the nation in the event of attack with atomic weapons It must do so in advance of aggressive action, not by choice but of necessity

As doctors, we have a far greater responsibility in the preparation for the possible outbreak of war than any other group, aside from the armed services This is so because the character of war has changed The front lines no longer will be scattered over remote parts of the globe War in the future will be brought to our front door Civilians, by no choice of their own, will become combatants Main Street will become an important target on every military map As members of the largest state medical organization in the nation, we owe it to our great population and to ourselves to give serious thought to what we are faced with, what we have to do to meet it and how we are going to marshall our resources to the best advantage A fundamental fact that emerges is that it will be the civilian doctor upon whom the brunt of atomic defense in its medical aspects will fall

By their explosive power alone, the new atomic weapons can deal death and destruction on a greater scale than the world has ever known before But when we add the effects of nuclear fission, with its radiation of neutrons and gamma rays and their consequent corrosive effect upon human life, we might have a catastrophe of staggering proportions It is quite apparent that no single community is going to be in the position to solve the problem The situation calls for cooperation on a state-wide basis, and even beyond state lines

If we are properly organized, we will know how to deal with the burns, shocks, fractures, and internal injuries among these casualties, just as in any disaster But no previous disaster has brought forth the complications of radioactivity The number of the radiation casualties in any area will depend on geographic and topographic factors Available medical observations indicate that, if any significant proportion of exposed individuals are to be saved, large numbers of whole blood transfusions will be necessary Leaving aside for the moment, the question of the supply of blood, who is going to do the screening that will determine which of the radiation casualties will receive the whole blood? No one but the civilian doctor or trained technician will be able to do it, and at this time I doubt whether the number of those having the training and experience is sufficient None of these problems can be left until disaster strikes

Imagine the problems facing the civilian doctor as he is mobilized from the surrounding country to work with sanitary engineers and with those charged with the evacuation and feeding of people of all ages from the stricken area Do not forget that much of the medical equipment as well as a great many doctors, nurses and ancillary personnel, may not be available after a visit from an atomic bomb! All medical personnel and equipment must be made available from nearby areas at once, to care for physical injuries, and shock—mental as well as physical The estimation of the effect of radioactivity in individuals, as well as the persistence of secondary radiations in materials, has to be made with all possible speed There is, in addition, the problem of bringing in large quantities of fresh whole blood, which presupposes supply in readiness at some accessible location

I urge all of you to give some serious thought to what you, as an individual, and also as a member of your county society, can do to lay the groundwork for thorough medical preparedness Perhaps the most important single step is for each one of us to come to a realization of the magnitude and importance of atomic warfare and the technical requirements for minimizing its effects After that, everything we do to inform ourselves of the technical and administrative difficulties involved will bring us nearer to a practical solution

I am not one of those who believe that the probability of atomic bomb attacks are either so remote that nothing *has* to be done, or so immediate that nothing *can* be done I feel it my duty therefore to write these lines

I sincerely hope that the uneasiness that grips the world will fade away, that we will find a peaceful way to solve national and international differences, that the miracle of atomic energy will be turned off the path that leads to destruction and be devoted to the improvement of the condition of man Finally, I hope that we whose profession it is to heal will not be called upon to put a crutch under a dying civilization It is a hope I am sure you all share with me

LEO F SIMPSON, M D

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Recommended Dietary Allowances 1948

On this page the revised recommended dietary allowances of the Food and Nutrition Board, National Research Council, with the original explanatory notes, are reprinted While the National Research Council Reprint and Circular series No 120 is recommended for those who desire a more comprehensive discussion, it is believed that the table and footnotes given here are adequate to guide physicians in most of their diet prescriptions

It is the desire of the Board that "the table be understood as representing levels of nutrient intakes which are desirable goals or objectives" They are not called requirements because they are designed to cover substantially all individual variations in the needs of normal people, rather than merely

RECOMMENDED DAILY DIETARY ALLOWANCES
Revised 1948
Food and Nutrition Board National Research Council

	Calories[a]	Protein (Gm.)	Calcium (Gm.)	Iron (Mg.)	Vitamin A (I.U.)	Thiamine (Mg.)[d]	Riboflavin (Mg.)[d]	Niacin (Nicotinic Acid Mg.)[d]	Ascorbic Acid (Mg.)	Vitamin D (I.U.)
Man (154 lb., 70 Kg.)										
Sedentary	2 400	70	1 0	12	5,000	1 2	1 8	12	75	/
Physically active	3,000	70	1 0	1	5 000	1 5	1 8	15	75	/
With heavy work	4 500	70	1 0	12	5,000	1 8	1 8	18	75	/
Woman (123 lb 56 Kg)										
Sedentary	2,000	60	1 0	12	5 000	1 0	1 5	10	70	/
Moderately active	2 400	60	1 0	12	5,000	1 2	1 5	12	70	/
Very active	3,000	60	1 0	12	5,000	1 5	1 5	15	70	/
Pregnancy (latter half)[e]	2,400[e]	85	1 5	15	6 000	1 5	2 5	15	100	400
Lactation	3 000	100	2 0	15	8 000	1 5	3 0	15	150	400
Children up to 12 years[b]										
Under 1 year[f]	110/3 2 lb. (1 Kg.)	3 5/2 2 lb. (1 Kg.)	1 0	6	1,500	0 4	0 6	4	30	400
1–3 years (29 lb., 13 kg.)	1,200	40	1 0	7	2 000	0 6	0 9	6	35	400
4–6 years (42 lb., 19 Kg)	1 600	50	1 0	8	2,500	0 8	1 2	8	50	400
7–9 years (55 lb., 25 Kg.)	2 000	60	1 0	10	3,500	1 0	1 5	10	60	400
10–12 years (75 lb., 34 Kg.)	2 500	70	1 2	12	4,500	1 2	1 8	12	75	400
Children over 12 years[b]										
Girls										
13–15 years (108 lb., 49 Kg.)	2 600	80	1 3	15	5 000	1 3	2 0	13	80	400

16–20 years (141 lb., 64 Kg.)	3,800	100	1 4	15	6,000	1 7	2 5	17	100	400

Objectives toward which to aim in planning practical dietaries. The recommended allowances can be attained with a good variety of common foods which will also provide other minerals and vitamins for which requirements re less well known.

[a] Calorie allowances must be adjusted up or down to meet specific needs. The calorie values in the table are therefore not applicable to all individuals but rather represent group averages. The proper calorie allowance is that which over an extended period will maintain body weight or rate of growth at the level most conducive to well being.

The allowances depends on the relative amounts of vitamin A and carotene. The allowances of the table are based on the premise that approximately two thirds of the vitamin A value of the average diet in this country is contributed by carotene and that carotene has half or less than half the value of vitamin A.

[d] For adults (except pregnant and lactating women) receiving diets supplying 2,000 calories or less, such as reducing diets, the allowances of thiamine riboflavin, and niacin may be 1 mg., 1.5 mg and 10 mg., respectively The fact that figures are given for different calorie levels for thiamine, riboflavin, and niacin does not imply that we can estimate the requirement of these factors within 500 calories, but they are added merely for simplicity of calculation. Other members of the B complex also are required, although no values can be given. Foods supplying adequate thiamine, riboflavin and niacin will tend to supply sufficient of the remaining B vitamins

There is evidence that the male adult needs relatively little iron. The need will usually be provided for if the diet is satisfactory in other respects

[f] For persons who have no opportunity for exposure to clear sunshine and for elderly persons the ingestion of small amounts of supplementary vitamin D may be desirable. Other adults probably have little need for such supplements

[e] During the latter part of pregnancy the calorie allowance should increase approximately 20 per cent above the preceding level. The value of 2 400 calories represents the allowance for pregnant, sedentary women.

[b] Allowances for children are based on the needs for the middle year in each group (as 2 5 8 etc.) and are for moderate activity and for average weight at the middle year of the age group.

[c] Needs for infants increase from month to month with size and activity The amounts given are for approximately six to eight months. The dietary requirements for some of the nutrients such as protein and calcium are less if derived largely from human milk.

the requirements of average individuals Using average needs as a basis would result in many being underfed On the allowance basis, however, many will doubtless receive levels in excess of their individual needs and thus the failure of an individual to meet these allowances does not mean by itself that he is malnourished On the other hand, it should be emphasized that the allowances are designed for normal people and that higher levels are needed to correct deficiency states

Further Recommendations Accompanying Recommended Daily Dietary Allowances

Fat There is available little information concerning the human requirement for fat Fat allowances must be based at present more on food habits than on physiologic requirements While a requirement for certain unsaturated fatty acids (the linoleic and arachidonic acids of natural fats) has been amply demonstrated on experimental animals, the human need for these fatty acids is not known In spite of the paucity of information on this subject there are several factors which make it desirable that fat be included in the diet to the extent of at least 20 to 25 per cent of the total calories, and that the fat intake include "essential" unsaturated fatty acids to the extent of at least 1 per cent of the total calories At higher levels of caloric expenditure, e g , for a very active person consuming 4,500 calories and for children and adolescent persons, it is desirable that 30 to 35 per cent of the total calories be derived from fat Since foodstuffs such as meat, milk, cheese, and nuts may be expected to contribute "invisible" fat to the extent of from one-half to two-thirds of the total amounts of fat implied by the above proportions of the total calories, it is satisfactory to use separated or "visible" fats such as butter, margarine, lard, and shortenings only to the extent of one-third to one-half of the amounts indicated

Water A suitable allowance of water for adults is 2 5 L daily in most instances An ordinary standard for diverse persons is 1 ml for each calorie of food Most of this quantity is contained in prepared foods At work or in hot weather, requirements may reach 5 to 13 L daily Water should be allowed *ad libitum*, since sensations of thirst usually serve as adequate guides to intake except for infants and sick persons

Salt. The needs for salt and for water are closely interrelated A liberal allowance of sodium chloride for the adult is 5 Gm daily, except for some persons who sweat profusely The average normal intake of salt is 10 to 15 Gm daily, an amount which meets the salt requirements for a water intake up to 4 L daily When sweating is excessive, one additional Gm of salt should be consumed for each liter of water in excess of 4 L daily With heavy work or in hot climates 20 to 30 Gm daily may be consumed with meals and in drinking water Even then, most persons do not need more salt than usually occurs in prepared foods It has been shown that after acclimatization persons produce sweat that contains only about 0 5 Gm to the liter in contrast with a content of 2 to 3 Gm for sweat of the unacclimatized person Consequently, after acclimatization, need for increase of salt beyond that of ordinary food disappears

Iodine The requirement for iodine is small, probably about 0 002 to 0 004 mg daily for each kilogram of body weight, or a total of 0 15 to 0 30 mg daily for the adult This need is met by the regular use of iodized salt, its use is especially important in adolescence and pregnancy

Phosphorus Available evidence indicates that the phosphorus allowances should be at least equal to those for calcium in the diets of children and of women during the latter part of pregnancy and during lactation In the case of other adults the phosphorus allowances should be approximately 1 5 times those for calcium In general, it is safe to assume that if the calcium and protein needs are met through common foods, the phosphorus requirement also will be covered, because the common foods richest in calcium and protein are also the best sources of phosphorus

Copper The requirement for copper for adults is about 1 to 2 mg daily Infants and children require approximately 0 05 mg for each kilogram of body weight The requirement for copper is approximately one-tenth that for iron A good diet normally will supply sufficient copper

Vitamin K The requirement for vitamin K usually is satisfied by any good diet except for the infant in utero and for the first few days after birth Supplemental vitamin K is recommended during the last month of pregnancy When it has not been given in this manner, it is recommended for the mother preceding delivery or for the baby immediately after birth

Folic Acid. Evidence for recognizing folic acid (pteroylglutamic acid, vitamin B_c, L casei factor or vitamin M) as an essential human nutrient is presented in the text The quantitative requirement cannot be closely estimated from evidence published to date

THE OUTLOOK FOR PATIENTS ADMITTED TO A MENTAL HOSPITAL AFTER THE AGE OF SIXTY

HOLLIS E CLOW, M D , White Plains, New York

(From the New York Hospital Westchester Division)

IT IS not infrequently assumed that persons who develop or suffer recurrences of mental disorders in their later years are likely to have poor prospects for recovery The steady extension of life expectancy, with its great increase in the actual as well as relative number of older people, directs attention to the important problem of their ability to respond to psychiatric treatment with subsequent capacity for social adjustment and usefulness

In relation to this question a careful study was made of the case histories of the 365 patients who had passed their sixtieth birthdays at the time of admission to the New York Hospital, Westchester Division during the ten-year period from January 1, 1936, to January 1, 1946 In January, 1948, a follow-up of the course of these patients was attempted, covering a period of at least two years subsequent to the most recent admissions In order to obtain objective information, letters of inquiry were written to the relative or friend who had been responsible for each patient during the period of hospital treatment. In some cases information had to be obtained from other hospitals in which patients were known to have been received after leaving here It would be expected that the information available regarding this group of patients would be somewhat limited by natural circumstances with relation to a period of time extending back in some instances nearly twelve years following hospitalization Nevertheless, 116 answers were received giving specific follow-up information over a period of from two to eleven and a half years. In addition to this, the course of 112 patients was known from our records for a period of up to two years after the patient had left the hospital The majority of the latter reports corresponded with progress notes made up to the time of actual discharge from the hospital when the patient had been at home on extended visit for our customary periods of six months or a year The courses then, of 228 patients or 62.4 per cent of the whole group were known after periods of up to eleven and a half years in several instances following hospital residence.

This hospital is a voluntary hospital whose policy is to accept acutely ill patients who are considered recoverable. A small proportion is accepted with mental disturbances related to the organic brain pathology associated with advancing years The average age of all patients admitted during the ten-year period studied was forty years The 365 consecutively admitted patients who had passed the age of sixty comprised 10 per cent of the total number of patients admitted during that period

A brief description will indicate the type of patient found in the group under consideration. Of the 365 patients studied, 218 were women and 147 were men. With regard to age, 268 patients, or 73 4 per cent, were in their seventh decade 82, or 22.4 per cent, were in their eighth decade, and 15 or 4 2 per cent, were in the ninth decade of life. The majority of the patients, numbering 224 or 61 per cent were admitted to the hospital on a voluntary' basis, while 141 were on some type of certification The domestic background revealed that 188 or 51 6 per cent were married 27 9 per cent were widowed 10 9 per cent were single and 3 6 per cent were divorced

The histories indicated that these patients were of normal or superior intelligence with the exception of one woman who was considered borderline in this respect They were generally well educated with a considerable proportion

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Neurology and Psychiatry May 20 1948.

having received college training The majority of them had been successful in occupations of responsibility in many fields As might be expected, most of the women were housewives, although 27 had supported themselves in business or professions from which eight of them had retired

The majority of the men had been engaged in business pursuits, while there was a substantial number representing the professions Twelve of these were physicians, 11 were lawyers, and four were clergymen The group also included six engineers, several architects, artists, college professors, and teachers Four patients had had no occupation Twenty-eight of the men, making a total of 36 in the whole group, had retired for varying periods previous to admission

Naturally, many different types of mental disorders were represented among these patients Although organic brain disease plays an increasing role in persons past the age of sixty, it should be considered that chronologic age alone is not necessarily an index of the presence or extent of organic brain pathology The appearance of such organic changes is a matter individual to a particular patient

Since the mental changes encountered here make up a diverse group, perhaps some liberty will be allowed in separating them simply and intelligibly into organic and functional reactions The organic disorders will include those mental conditions ordinarily considered to be dependent on chronic organic or toxic changes in the brain which have been demonstrated to be present in such cases Clinically, the characteristic symptoms are memory defect, disorientation, emotional lability, impairment of comprehension and judgment, fluctuation of attention, and at times a delirium The reactions considered to be functional are characteristic syndromes which show no demonstrable brain pathology

The organic psychoses included 128 patients or 35 1 per cent of the entire group Seventy-six, or 29 9 per cent, had psychosis with cerebral arteriosclerosis, while 33, or 9 per cent, suffered from senile psychosis These two groups totaled 83 6 per cent of all patients who had organic reactions The remainder of the organic mental conditions were miscellaneously distributed with five cases of alcohol or drug addiction with psychosis, three patients with well-advanced syphilitic meningo-encephalitis, two with psychosis associated with paralysis agitans, one associated with brain tumor, one epileptic clouded state, one with psychosis associated with diabetes, one with psychosis due to illuminating gas poisoning, and five patients with psychosis associated with other disturbances of the circulation and related to cardiovascular-renal disease Such conditions were not infrequently associated with a delirium

The 76 patients over sixty years of age who suffered from psychosis with cerebral arteriosclerosis consisted of 27 men and 49 women whose median age was sixty-nine years The oldest patient was eighty-six The median duration of illness before admission to the hospital was six months The median length of hospital treatment was one year and three months, while the longest period was eight years

The follow-up, ranging from two months to ten years, showed that seven of these patients suffering from psychosis with cerebral arteriosclerosis had eventually made a recovery, eight had become much improved, and 19 improved The 15, or approximately one fifth of the whole group of 76 who were either recovered or much improved, adjusted very comfortably at home, while two returned to work These results compare with a previous report from this hospital on 100 patients suffering from psychosis with cerebral arteriosclerosis in which 23 per cent were found to have been either recovered or much improved

As in the previous report, the patients who did well were, for the most part, those in whom the more delicate adjustment of the patient with cerebral arteriosclerosis appeared upset by emotional or toxic factors and in whom the psychosis disappeared when treatment was directed toward alleviating these precipitating factors It was also noted in the present study that all of these patients who did well were those who had good resources in that they had something to return to in the way of security and a family who wished to care for them Of course, many who had these resources did not do well, perhaps because their actual permanent organic involvement was too great for restitution of their mental adjustment

Patients are considered recovered who are completely well and able to carry on their work or other activities in the usual manner The patient who is socially adequate at home but shows slight residual limitations is termed much improved Improved patients are those who are more comfortable in the hospital or perhaps at home with nursing care

The patients with senile psychosis numbered 33, of whom 20 were women and 13 were men The median age on admission was seventy-six The oldest was eighty-five, and the youngest was sixty The median duration before admission was two years and six months The median hospital residence was seven months and three weeks These patients were with one exception, feeble, and all showed characteristic mental deterioration

This group of patients showed little capacity for definite improvement. Fifteen died account ing for more than one quarter of all deaths occurring in the hospital in this age group One woman of seventy-six in whose illness definite adequate emotional factors were present became much improved and remained so until she died at home a year later Five patients were improved and ten unimproved on leaving the hospital while two remained in the hospital unimproved after four and five years. Follow-up reports obtained in ten cases indicated that when last heard from one was at home much improved after two months, eight had died within a year, and one was in a nursing home unimproved after two years.

Of the remaining 19 patients with organic types of mental disorder, all had conditions of toxic or infectious nature Five of these were suffering from psychosis with cardiorenal disease with symptoms of organic delirium. Their median age was sixty five The median period of hospital residence was two months One patient died in the hospital, two were considered recovered, and two were improved at the time of leaving the hospital Follow-up reports showed that one of the recovered patients remained recovered after ten weeks, while the other returned to work remaining well for ten months when she died of coronary disease Four patients had psychosis associated with drugs In two instances the drugs were barbiturates and in two bromides were responsible All suffered from a drug delirium. The condition in all cases was associated with a history of the use of sedatives and not due to longstanding drug addiction The median length of hospitalization was three months All four patients were considered recovered when they left the hospital Follow-up information over periods of from one month to eleven and a half years showed all to have remained recovered The patient on whom a report was received after the eleven and a half year period remained well at eighty

Only one patient in this age group was admitted with psychosis due to alcoholism. He was sixty-eight years old and had been ill for eighteen months After six weeks he was transferred to another hospital where he was reported after six years to remain unimproved

Miscellaneous chronic organic conditions accounted for mental disorders in the nine remaining patients, of whom three died in the hospital while two were much improved two improved and two were unimproved

In all patients studied mental disorders distinguished by features generally considered as functional and without demonstrable evidence of organic brain changes numbered 237 or 65 per cent of the whole group These consisted of 111 patients with the various types of manic-depressive psychosis, which represented the largest diagnostic group, and accounted for 30 4 per cent of the total Also included in the functional group were 53 instances 14.5 per cent with involutional psychosis, of whom 46 had melancholia and 7 were of the paranoid type Forty nine or 13 4 per cent of all patients suffered from the psychoneuroses Twelve patients, or 3.3 per cent, were diagnosed as suffering from either alcoholic or drug addiction without psychosis with the condition related to their difficulties in personality adjustment There were eleven patients, or 3 per cent of the whole number of patients, with exacerbations of well established dementia praecox reactions. One patient had a long history of psychopathic personality with pathologic sexuality without psychosis

In considering the group of patients with manic-depressive psychosis, we find that 71 were women and 40 were men. Forty-one patients with manic-depressive psychosis mixed type required the longest period of hospitalization of any of the manic-depressive types with a median time of nine months. Thirty three had had previous attacks, while eight had not Thirty four patients with manic-depressive, depressive conditions had the shortest period of hospital residence, with a median of time of four months and three weeks All of these had recovered from previous attacks. Manic-depressive circular reactions were 22 in number and included 16 women and six men. Thirteen of these were known to have had previous attacks while eight had not The median length of hospitalization in this group was eight months Fourteen patients, of whom eight were women and six were men had manic-depressive psychosis manic type, with a median time of eight and one-half months hospitalization. From the standpoint of a manifestation of outward aggressiveness rather than depression in meeting the difficulties of later years it is psychologically interesting to note that three men and three women or a total of six out of 14 in this group experienced their first attack of mental illness after they had passed the age of sixty All of the patients with depressive episodes had had previous attacks

Of the manic-depressive group as a whole, 5 per cent in this age group died in the hospital At the time of leaving the hospital, 43 per cent were recovered 22 per cent were much improved 18 per cent were improved and 12 per cent were unimproved A total of 72 patients or 65 per cent of the manic-depressive group as a whole were recovered or much improved and

were able either to return to their work or to live comfortably at home No significant difference appeared in this group in the outlook for those who had had previous attacks as compared with those who were having their first attack of manic-depressive psychosis, manic type

Follow-up studies were available in 93 patients in this group after periods of from two months to nine and a half years Of these, 60 were known to be recovered after a median period of two years and eight months Of eight patients last heard from after seven years, six remained recovered, one died, and one was unimproved One woman, now aged eighty-two, remains recovered after four years and three months and has continued to be very active in club and other social work

Involutional psychoses were responsible for 53, or 14 5 per cent of this age group, with 31 women and 22 men The median age of the patients was sixty-three years The median length of hospital stay was seven and a half months Two patients died in the hospital, seventeen were recovered, ten were much improved, fifteen were improved, and nine were unimproved A total of 27, or approximately half of the patients, were either recovered or much improved Follow-up reports in 46 instances over a period of from six months to nine and a half years showed that 21 had achieved recovery, of whom four had relapsed, six were much improved, three improved, and six were unimproved Seven of this group had died at the time of follow-up

Involutional psychosis as it appears in this group can be thought of as a fairly uniform and consistent disorder which lends itself to a consideration of some of the prognostic factors Symptoms, usually of a severe agitated depresssion, occur at some time in middle life or later, in a characteristically rigid personality with relation to certain typical psychologic problems of readjustment incident to advancing years Physical problems play their part, but there is no demonstrable evidence of organic brain involvement Any conception that this condition is caused essentially by endocrine changes does not seem very helpful to understanding the depressive or sometimes paranoid features of the disorder, as they are characteristically observed to relate to emotional difficulties in adjustment to changes in the patient's life situation Endocrine as well as many other factors may at times play a part Involutional psychosis is considered here to be primarily rather than secondarily an emotional problem

A careful examination of the records indicated that adequate external precipitating factors occurred in 42 of the patients admitted with involutional psychosis That is to say, some loss or threat was suffered which might reasonably be expected to cause deep concern to the patient Often this was unwanted retirement from work, financial loss, or some disturbance in the person's usual rigid way of life In several instances it was the threat of an incapacitating physical condition

The adequacy of the precipitating causes, considered together with the resources of the patient, appears to be a valuable feature in estimating the capacity of the patient to make and maintain a recovery In the group of 21 patients with involutional psychosis found on the follow-up to have recovered, precipitating factors were considered adequate in 19 and inadequate in two In the cases of the two patients with inadequate precipitating causes, both patients relapsed in a short time In attempting to evaluate the resources of patients in terms of a history of an adequate prepsychotic personality, reasonable financial security, and a good social or domestic situation to which he or she could return, it was considered that in eight cases the resources were only fair Of these, four patients had relapsed at the time of follow-up, while four remained recovered In the 14 patients whose resources were considered poor, none were recovered, two were much improved, seven were improved, and five were unimproved on leaving the hospital In the follow-up over a nine and a half year period, reports were received on nine, indicating that eight were unimproved and only one was much improved On the other hand, in 13 patients where the external precipitating causes were considered adequate and the resources good, 12 patients were recovered at the time of follow-up, while only one had relapsed

The relation of the patient's resources or of having an incentive to get well was noted as an important factor in psychosis with cerebral arteriosclerosis It was also important in the manic-depressive, depressive, and mixed types, where, of 17 patients considered to have poor resources, only two were recovered, two were much improved, five were improved, and eight were unimproved on leaving the hospital Follow-up reports on 15 of these patients up to a period of six and a half years showed that one had remained recovered for a year and five months and two were improved, while the remaining 12 continued unimproved or relapsed from the degree of improvement achieved in the hospital The course of these patients is to be compared with the 47 patients reported completely recovered in the case of 66 similarly followed in the manic-depressive, depressive and mixed groups, as a whole

Metrazol, and more lately electric shock, was

used for 30 patients who had either manic-depressive, depressive, or mixed reactions, and for 16 patients with involutional psychosis melancholia, making a total of 52 patients receiving this treatment in the age group Of the patients who were considered to have poor resources, seven received electric shock therapy with two much improved on leaving the hospital, while four were improved and one was benefited only briefly When last heard of up to a period of six and a half years in the case of five none were recovered or much improved, while only two were improved and three were unimproved The remaining 35 patients who were considered to have fair or good resources responded much more favorably with 32 progressing to recovery with only five relapses known in the 28 patients reported in a follow-up *period of six and a half years*

In considering the 49 individuals with psychoneuroses or 13 4 per cent of studied admissions, the median age was found to be sixty five Eight patients were seventy or more of whom the two oldest were seventy nine Twenty five, or more than half, gave no history of previous attacks, while the remaining 24 individuals had suffered from one to ten previous episodes. The median duration of illness before admission was four months, while the median period of hospital treatment was three and a half months Twenty three patients had psychoneurosis of the mixed type, of whom four were recovered, eleven were much improved six improved, and two were unimproved at the time of leaving the hospital The patients with reactive depressions showed the best improvement, with ten of 16 recovered four much improved, and two improved None of the four patients with hypochondriasis recovered, while one was much improved, two were improved, and one unimproved One patient with an anxiety state died of a coronary attack two were much improved and one was unimproved Of two patients with psychasthenia one was much improved and one improved Thus 33 patients or approximately two thirds of the group made substantial recovery

After a follow-up of 34 patients extending to a period of nine and a half years 23 of the group were known to have recovered eight were much improved one was improved and two unimproved

The case report of a patient with psychoneurosis indicates strikingly and instructively the capacity of many elderly patients to return to an active and useful life.

Case Report

Case 1—A seventy-nine-year-old single professional man was admitted for treatment of his severe apprehension indecision, anxiety and depression of *four months duration He was a very successful* competent and cultured man whose history indicated neurotic episodes over a period of many years without previous hospitalization The present attack seemed partly precipitated by undue worry over rheumatoid arthritis in his left hand

On admission he appeared tense anxious and given to variable dramatic emotional display At times he was critical He could be temporarily reassured and at times could sit and talk pleasantly and reasonably He was discouraged but not suicidal. He talked with some pride of what he considered the baffling nature of his problem His recent and remote memory were good and he showed no evidence of organic mental involvement

His general physical condition was good with comparatively little evidence of peripheral or retinal arteriosclerosis His teeth required attention *Heart lungs and abdomen were negative except* for an appendectomy scar His blood pressure was 140/80 Some evidence of rheumatoid arthritis was present in his left wrist X ray studies of his wrist and chest were essentially negative. Clinical laboratory studies including urinalyses blood cytology chemistry and serology were essentially negative.

In the hospital he leaned heavily on his physician *for support* For his physical condition he received vitamin therapy and baking to his wrist with relief His mental condition improved slowly but steadily After six weeks he found that there were difficulties in his firm which he owned and that his associates required his help since he was the only one capable of straightening out the trouble. After some indecision he left the hospital on extended visit after two months residence. He soon became absorbed in the responsibilities of his business, which he salvaged and increased by the use of many new ideas He continued to live comfortably at his club A recent follow up after four and a half years reports that he is still interested, has unimpaired judgment manages the responsibilities of his work, appears younger and attends regularly to his office at the age of eighty three

A small group of eleven patients was admitted after the age of sixty of whom five were diagnosed as having without psychosis alcoholism and six as without psychosis drug addiction.

The average duration of the alcoholism before admission was three years. All patients left the hospital against advice after a median stay of three months At the termination of hospital treatment one was considered recovered two much improved and two improved Follow up reports on three indicated that one had remained recovered for three years before resuming alcohol The other two were still abstinent after six months

The six patients admitted with the diagnosis of without psychosis drug addiction had a median duration of addiction for six years and had con-

tinued for twenty years in two patients Three had been addicted to morphine, two to barbiturates, and one to codeine All left the hospital against advice after a median stay of two months Follow-up studies on four patients indicated that one morphine addict was much improved and working after five years, while another relapsed after four months One barbiturate addict was recovered for one year and then relapsed The other had continued without drugs for eleven months

Summary

The outlook for patients admitted to a mental hospital after their sixtieth year has been studied in a group of 365 such individuals consecutively admitted to the New York Hospital-Westchester Division during the ten-year period from January 1, 1936, to January 1, 1946 The median age of these patients was sixty-five years, the oldest of whom was eighty-six

Diagnostically, they represented a diverse group The larger proportion, or 64 9 per cent, suffered from reactions generally considered to be functional in type These included the involutional psychoses which appeared essentially to represent typical agitated and paranoid depressions arising in rigid personalities in response to changes in the life situation necessitated by advancing years In the remaining 35 1 per cent of patients the usual mental and physical evidences of psychosis associated with organic impairment of the brain were present

At the time of leaving the hospital the group as a whole showed 24 1 per cent to have recovered, 19 7 per cent to be much improved, 20 3 per cent improved, 21 4 per cent unimproved, and 14 5 per cent to have died in the hospital The outlook for those patients with conditions due to marked irreversible brain pathology would not be expected to be favorable Of the 33 patients with senile psychosis, none recovered, although one continued to be much improved for a year Of the patients with psychosis with cerebral arteriosclerosis, however, 15, or 19 7 per cent, showed substantial improvement with the ability to adjust adequately at home in a recovered or much improved condition Of four patients admitted with organic delirium due to drugs, all recovered

The patients with functional mental disorders showed marked capacity for recovery, particularly those in their seventh and eighth decades of life This was well shown in the large group of 111 patients with manic-depressive disorders, of whom 43 per cent were recovered and 22 per cent much improved on leaving the hospital In contrast, however, none of the eleven patients with well-established dementia praecox showed any great improvement

The material studied indicated the importance of adequate precipitating causes of illness and of the possession of good resources by the patient with regard to security and a favorable family situation in his ability to recover and remain well for an appreciable time

Apparently age was also a factor in recovery, with those in the seventh decade showing a greater tendency to recovery than those in the eighth or ninth decades of life Twenty per cent of the patients in their seventies were recovered, and 16 6 per cent much improved, as compared with 24 1 per cent recovered and 19 7 much improved in the group studied The 15 patients who were in their eighties at the time of admission showed no complete recoveries, but their illnesses were for the most part in this study associated with marked chronic organic brain disease

A case report was given indicating the recovery of a man from an episode of mental disorder which commenced at seventy-nine who has since continued recovered, and managed responsible work for the past four years

Discussion

George K Collier, M D , *Rochester*—Dr Clow brings to our attention the very large group of the aged who are so often forgotten after being placed in mental hospitals or homes for the aged He points to the ever-increasing number of old people resulting from the advances made in medicine and the better care provided both by State and private agencies Our New York State mental hospitals report 55 to 60 per cent of all their admissions as being over sixty-five years of age, in comparison to Dr Clow's figure of 10 per cent of all admissions to his hospital This disparity in the admission rate of the aged is due to the fact that the admissions to Dr Clow's hospital are a more or less selected group considered suitable for treatment, whereas the State mental hospitals are required by law to accept any and all patients who are properly certified for admission

As a result of changes in our social and economic life, and the contracting of the home, many of the aged who formerly were kept in the home are now sent to mental hospitals This resultant overcrowding has added to the worries of hospital directors, and some thought is now being given to the question of establishing special hospitals for the aged mental case Special geriatric hospitals to care for all types of the infirm aged, whether mental or physical, might be advisable, but we should make a further study before such a plan is adopted Tuberculosis and mental disease are the only chronic conditions now being cared for It might result in a more intensive isolation and an overspecialization Psychiatry is all inclusive, and it is only in our study of the full life span that we will be able

to evaluate properly the behavioristic changes in man Dr Clow has shown us what can be accomplished with a selected group He stresses the fact that age alone is not necessarily an index of the presence of organic brain pathology His patients were a group of successful men and women—architects, engineers lawyers, physicians clergymen—all of normal or superior intelligence who had been successful in their respective fields. He refers to an adequate precipitating factor some loss or threat an unwanted retirement financial loss or some incapacitating physical factor When we study our histories carefully we will find a similar cause. He shows us that, if this precipitating factor is recognized early, much can be done to bring about a fairly well-adjusted personality In evaluating such patients we should always look for their latent resources In a proper environment many of these reserves can be stimulated into activity Old desires and wishes can be brought to fruition As has been so aptly stated the man who balances and closes his books each and every day has but little to call upon when age creeps up on him. However that man who is mentally and physically active, assuming life's daily responsibilities, has so much left over from the day's work that these accumulations become of great value to him when physical impairments, financial loss and isolation come upon him

Dr Clow's paper should stimulate us to a more intensive study of our aged patient, and especially is this paper directed to the general practitioner who is in a position to observe the early emotional and toxic factors for which so much can be done We should have further study of the physiologic and psychologic changes in the aged In almost every community we have social agencies which can be called upon for assistance These include the home bureau services industrial workshops guidance centers, and the Red Cross all of which have occupational activities which can be of much therapeutic value to the aged

---

FEVER THERAPY MAKES PENICILLIN MORE USEFUL AGAINST SYPHILIS

Artificially produced fever increases the effectiveness of the seven and a half day penicillin treatment for syphilis to more than 80 per cent, a substantial improvement over both penicillin alone and penicillin and mapharsen in combination for the same length of time

This valuable use of fever therapy is described by Herman N Bundesen, M D president of the Chicago Board of Health and a group of four doctors who assisted him, in an article which appeared in the July 31 issue of the *Journal of the American Medical Association*. Three of the doctors—George N Schwemlein research associate at the Kettering Foundation for Medical Research Cincinnati, Ohio, Theodore J Bauer senior surgeon of the United States Public Health Service and venereal disease control officer Chicago, Illinois and Robert M Craig of Dayton Ohio—together with Dr Bundesen pioneered the penicillin and penicillin-mapharsen treatments for syphilis.

In comparison with the 80 per cent effectiveness of penicillin and fever therapy in seven and one-half days their tests show penicillin 70 per cent effective and penicillin given with mapharsen a compound of arsenic, 49 per cent effective against syphilis in seven and one-half days

The fourth physician in the research group is Jack Rodriquez medical director of the Chicago Intensive Treatment Center, where the group tested the fever and penicillin method from January 4 through July 29, 1945

Each patient was given an injection of sodium penicillin every three hours for 60 doses plus three three-hour sessions of artificial fever on alternate days beginning twenty three hours after the penicillin was started.

Fever therapy however, does not cut down on the time required for penicillin treatment, the doctors found. When they gave patients the same amount of penicillin—1,200 000 units—in about thirty hours and reduced the fever therapy to one six-hour session the treatment was effective in only 60 per cent.

Neither is giving large amounts of penicillin without fever therapy more effective the article indicates citing research not yet completed. When patients were given 25 000 000 units of penicillin in twenty four hours during this research the drug was about 65 per cent effective

SCHIZENCEPHALIES WITH HYDROCEPHALUS· CLINICAL DIAGNOSIS OF SEVERE CEREBRAL AGENESIS

WILLIAM F BESWICK, M D , Buffalo, New York

(From the Department of Neurological Surgery, University of Buffalo, School of Medicine)

IN 1946, Yakovlev and Wadsworth presented a very exhaustive study of congenital clefts in the cerebral mantle [1] The term "schizencephaly" was offered for use in separating these cerebral aplasias of formal origin from the porencephalies or acquired cerebral defects Cohn and Neumann suggested that "schistencephaly" would be more proper [2] Three of the cases studied and described were associated with severe hydrocephalus, in two this was absent

During the past two years three infants admitted to the hospital with hydrocephalus were demonstrated to be schizencephalic Subdural hematomata were suspected in all three

Case Reports

Case 1 —S A M , a seven-week-old girl, was admitted to the Children's Hospital of Buffalo, October 1, 1946, and the following history was obtained Birth was normal and spontaneous at full term After birth the infant cried a good deal and was irritable At three weeks of age it was discovered that the head was larger than normal X-ray studies of the skull and spine were negative There were no convulsions and no vomiting The patient took feedings well.

Examination revealed a very irritable, crying, well-nourished baby of seven weeks with enlarged head (circumference 17½ inches) whose bulging anterior fontanelle was seven inches wide A right divergent squint was present There was no blinking of the eyes when objects were brought suddenly toward them The right pupil was larger than the left The arms and legs moved freely Muscle tone was normal Tendon reflexes were present and equal No abnormal reflexes were recorded

Urinalysis and blood studies were negative Electroencephalography was reported as showing "very little true cortical activity "

Subdural punctures were made on October 8, 1948, and 20 cc of clear, colorless fluid were removed bilaterally The protein content of the fluid was 31 to 32 mg per cent Almost continuous crying persisted, and there were occasional generalized tremors The child vomited several times during the next twenty-four hours The anterior fontanelle remained depressed for two days

Attempts to make ventriculograms failed until October 20, 1946, when about 360 cc of xanthochromic fluid were replaced by an equal amount of air The films were not diagnostic There were large collections of air on either side of the falx occupying greater than 50 per cent of the cavity Indefinite tissue shadows were present in the occiput and posterior temporal regions Cerebral agenesis of marked degree was suspected, but large subdural hygromas could not be excluded

On October 21, 1946, a right frontotemporal craniotomy was performed by Dr W B Hamby His note in part reads, "A tremendous cavity was found filled with slightly opalescent, xanthochromic fluid This was removed with a suction tip, and into the bottom of the skull were seen projecting two white masses that proved to be the thalami The olfactory bulbs extended forward to their terminations beside the crista galli Behind the thalamus the right hippocampus was seen, and curving backward from it along the edge of the falx was a white curved rim of tissue Beneath and behind the thalamus appeared a small band of rather normal looking cerebral cortex This represented approximately the posterior half of the temporal lobe and a small amount of the occipital lobe, and it extended forward about 1 cm anteriorly to a group of veins that resembled Rolandic vessels entering the sagittal sinus Hanging from the groove behind the two thalami were two pink veil-like membranes, on the lower end of which appeared pink convoluted masses representing the choroid plexus One could see past the left thalamus the left hippocampus Beyond that one looked directly upon a thin membrane that lined the dura of the left side of the cranium The left meningeal artery could be traced from the sphenoid wing back up over the convexity The membrane representing the pia was opened just over the location of the optic nerves exposing the chiasmal area The right optic nerve appeared normal and across it coursed the anterior cerebral artery " At this point the exploration was terminated

The patient is still alive, blind, deaf, and unable to sit up There is no evidence of persistent hydrocephalus

Case 2 —R F S , a boy, 4 months of age, was admitted to the Children's Hospital of Buffalo, April 30, 1947, because of a "large head" and impaired vision The patient, a third child, full term, was delivered with forceps, following nine hours of labor There was no cyanosis, but the infant became jaundiced about the fourth day The child never appeared able to see At eight months the mother noticed that the arms and legs seemed stiff and the head larger than normal The patient was very irritable and cried much of the time There were no convulsions, but the child would shake its head as if it were "trying to shake off something " He had frequent choking spells, and he vomited occasionally during the first and second months Feeding and

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City, Section on Neurology and Psychiatry May 20 1948

bowel habits were good The child has appeared to have had a ' cold since birth

As regards family history the mother had had poliomyelitis at the age of seven years Physical examination revealed a well-nourished boy with large head (18 inches in circumference) and bulging anterior fontanelle There was a downward converging squint, and the child did not blink when bright objects were brought suddenly to his face The pupils were regular and equal. (Reflex responses were not recorded.) The child did not react to loud noises. The neck was rigid and moderately extended. The arms were flexed while the legs were held in extension. The tendon reflexes were hyperactive but equal and Babinski responses were present bilaterally There was bilateral ankle and patellar clonus. Moro s clinging reflex was questionably positive Magnus and deKleyn responses were absent

Blood and urine studies were negative X ray studies of the skull revealed evidence of early hydrocephalus. Electroencephalograms showed none of the normal cortical activity which starts at this age

On April 30 1947, subdural punctures were performed, and 15 cc of clear colorless fluid with total protein content of 17 mg. per cent were removed bilaterally Traumatic spinal puncture was made (1,000 red blood cells per cu. mm) Total protein content was 368 mg. per cent (centrifuged specimen) On May 2, 1947, ventriculograms were made by inserting needles bilaterally to a depth of two and one-half inches at the lateral extremity of anterior fontanelle Seventy cc. of fluid were removed from the right side and replaced by an equal amount of air Two hundred thirty cc. of fluid were removed and replaced by an equal amount of air on the left. One cc. of phenolsulfonphthalein dye was injected on either side. X ray studies revealed the absence of a recognizable ventricular system. One could visualize a mass of intracranial tissue indefinitely outlined that suggested poorly developed left temporal occipital and midline occipital parietal lobes. The entire right cranial vault was lacking in demonstrable neopallium No dye appeared in cerebrospinal fluid collected in the lumbar region

On May 8, 1947 the discharge diagnosis was cerebral aplasia with hydrocephalus

At examination on April 14, 1948 the child was irritable and could not hold his head up He was blind and deaf There was no papilledema or optic atrophy now and Magnus and deKleyn reflexes were absent.

Case 5—S E. A a three-month-old girl, was admitted to the Children s Hospital of Buffalo September 13, 1947, because the infant s head seemed larger than normal Birth was three weeks premature and out of wedlock. Birth weight was 4 pounds and 15 ounces The baby was taken to foster parents one week later, after examination by a very competent podiatrician No abnormalities were found by him. From the second week of life the infant cried a great deal and seemed hungry most of the time. She sucked her hands continuously Five days before admission, the head seemed larger than normal On one occasion the foster mother thought the head transilluminated light from a floor lamp, while the baby was being nursed There were no convulsions and only occasional vomiting Constipation was noted from birth.

The patient was a well-nourished infant with obvious hydrocephalus (head circumference 15 inches, chest 11 inches) The child was irritable and had a shrill cry She moved her arms and legs jerkily She did not notice lights or objects before her eyes. The pupils were round regular and reacted briskly to light According to Dr Meyer Riwchun, ophthalmologist, there was primary optic atrophy particularly affecting the temporal halves of the nerve heads and a diffuse, low grade degenerative chorioretinitis most marked in the macular areas There was no reaction to loud noises Light touch brought out brisk startled reaction Moro s reflex was absent Tendon reflexes were hyperactive but equal and positive Babinski signs were present bilaterally

Blood and urine studies were negative X ray examination of the head revealed that the skull was wide in all diameters. The bones were thin and the fontanelles were widely open Electroencephalograms showed only the artefact of movement.

On September 10, 1947 subdural punctures revealed clear, colorless fluid bilaterally The needles were inserted to a depth of about 2½ inches, and clear fluid was found One cc of indigo carmine was then injected Lumbar punctures made at intervals of thirty minutes and two hours later failed to reveal any dye in the cerebrospinal fluid

Ventriculograms were attempted on September 13 1947 Eighty cc. of air were injected into what was thought to be both lateral ventricles X-ray study revealed large air-filled cavities but no evidence of a ventricular system was seen

On the same day the right and left subdural spaces were drained via bitemporoparietal burr holes Xanthochromic fluid drained copiously for two days. The anterior fontanelle remained retracted after the procedure.

On September 18 1947 right temporoparietal craniotomy was carried out. Immediately beneath the dura, we encountered a thin membrane thought to be the external membrane of a subdural hygroma Clear, slightly xanthochromic fluid was aspirated away, and the cavity present had to be inspected with the aid of a lighted retractor It was bounded medially by the entire falx cerebri covered by the thin membrane. No neopallium was seen on the right The membrane running downward beneath and perpendicular to the falx was opened and the same absence of neopallium was witnessed on the left The basilar structures consisted of large bulbous thalami apparently about 4 cm. in diameter A mass of choroid plexus was identified on the right side. After a sketch of the structures was made the exploration was terminated The bone and scalp flaps were closed in the conventional manner

The child expired on October 26 1948 Autopsy was obtained.

Summary and Conclusions

Three cases of schizencephaly with transient hydrocephalus have been reported In two cases

the diagnosis was completed by surgical exploration, while in one case air studies were sufficient

The diagnosis of schizencephaly is important for prognostication Although prognosis for longevity of life is hazardous, that for ultimate degree of function is certain The two living individuals are as undeveloped neurologically today is they were one year ago

Pediatricians cannot be expected to discover defects of the neopallium before that complex structure is known to exert its influence on the organism

CITES IMPORTANCE OF EARLY DIAGNOSIS IN STOMACH CANCER

The time has come to abandon the old attitude of hopelessness toward cancer of the stomach and esophagus, declares Richard H Sweet, M D , visiting surgeon at the Massachusetts General Hospital, Boston

Writing in the July 31 issue of the *Journal of the American Medical Association*, Dr Sweet says that "cancer of the stomach can be cured in an appreciable number of cases," provided that an early diagnosis is made and that the growth is of a reasonably favorable type

Attitudes toward cancer of the esophagus are also changing, he indicated Pointing out that until recently this type of cancer was considered quickly fatal in all cases, Dr Sweet reports that "an appreciable number" of patients with cancer of the esophagus now survive three years or more because of advances in surgery

"Earlier diagnosis, lower operative mortality, and a widening of the scope of the operation for cancer of the stomach have presumably cured a larger number of patients with stomach cancer in recent years"

Cancer of the stomach has long been regarded as a common disease Cancer of the esophagus is also a common disease from which about 27,000 persons die annually in the United States, according to Dr Sweet As an estimated 40,000 persons die each year in this country from cancer of the stomach, the two types cause nearly 21 per cent of the total deaths from cancer in the nation

Statistics have shown a one-sided picture which is unduly discouraging to patients with cancer of the stomach, Dr Sweet emphasizes Latest reports from various clinics show that 20 to 30 per cent of patients operated on for the disease are living five years after the operation, he says, explaining

"Statistical studies from various sources show that of all patients with proved cancer of the stomach, not over 5 per cent survive five years or more, and then only as a result of the application of surgery

"To be influenced by this apparently discouraging result, however, is to place emphasis on the wrong aspect of the problem The fact that, of all cases of cancer of the stomach in which a diagnosis has been made, in only 5 per cent a cure is effected, indicates that a large percentage of the cases are unsuitable for surgery when the patient is first seen or too far advanced for cure even though surgical excision is attempted There are innumerable statistics to prove this contention"

Massachusetts General Hospital statistics show six types of stomach cancer More than 90 per cent of patients operated on for the most favorable type were living five years or more after the operation

Of the second most favorable type, 75 per cent were living five years after operation, and of the third and fourth most favorable types, 40 per cent were living five years after operation

The most frequent type of stomach cancer, advises Dr Sweet, is the adenocarcinoma, the third most favorable.

The outcome of both cancer of the stomach and of the esophagus depends upon early diagnosis and immediate surgery, yet most cases of cancer of the esophagus are in a far advanced state by the time the patient is seen by the surgeon, and at least 25 per cent of cases of stomach cancer are unsuitable for operation because of the advanced stage of the disease

Cancer of the esophagus is a highly malignant type and progresses rapidly, warns Dr Sweet Therefore, it is extremely important that the patient consult a doctor at the first symptoms of such a disturbance. These are difficulty in swallowing and choking on food

Most persons are likely to do nothing about such symptoms except to chew food more carefully or to avoid eating foods which cause difficulty Only 22 per cent of the patients with cancer of the esophagus studied by Dr Sweet at the Massachusetts General Hospital entered the hospital in less than three months after symptoms were first noticed More than 35 per cent waited from three to six months and nearly 11 per cent waited more than 12 months

Every patient who complains of any disturbance associated with swallowing, whether it is with or without discomfort in the area of the esophagus, should be examined with x-rays, and many such patients should be examined with the esophagoscope

Onset of cancer of the stomach is often insidious and the early symptoms are often vague, he points out Only sometimes is pain felt, more obscure symptoms are discomfort, indigestion, or a bloated or full feeling after eating

Since the accuracy of x-ray films in diagnosing cancer of the stomach is not more than 90 per cent with even the most expert technicians, according to Dr Sweet, he recommends inspection of the interior of the stomach with a gastroscope or esophagoscope

Cancer should be suspected in every case of gastric ulcer which does not heal completely under treatment within a short time—one month at the most—Dr Sweet cautions

SPINAL EPIDURAL INFECTION

EVERETT W CORRADINI, M D , M FRANK TURNEY M D and
E JEFFERSON BROWDER M D Brooklyn, New York

(From the Department of Surgery, Long Island College of Medicine and the Neurosurgical Service, Kings County Hospital)

IN 1941, there was presented from this clinic a review of 14 cases of pyogenic infection in the spinal epidural space.[1] Since then we have encountered 11 additional patients with this disease This communication is an analysis of the entire group of 25 patients Its purpose is to emphasize the characteristic features of pyogenic infection in this region and to ascertain the extent to which the use of sulfonamides and antibiotics has affected the results. We believe the syndrome requires re-emphasis because in our experience most patients with this disease are not referred to the neurosurgeon until the spinal cord has been considerably disturbed by the process. This delay seems to be due to the fact that the disease is not commonly recognized in its early stages. However, the catastrophic results attending delay (of even a few hours, in some cases) make early treatment imperative

Recognition of this syndrome is not difficult if the presence of such a pathologic process is considered a cause of the symptomatology Subsequent to or concomitant with an infection that is sometimes considered trivial or has long since been forgotten, there is a sudden onset of pain in the back and/or radicular pain, followed by evidence of altered spinal cord function In the absence of early treatment, the process advances rapidly to complete or almost complete functional interruption of the spinal cord. The syndrome may be considered in terms of three components pre-existing infection, pain in the back or radicular pain, and alterations in function of the spinal cord

A history of antecedent infection was elicited from 21 of the patients in this group In five the epidural infection was preceded by the appearance of furuncles on various parts of the body In five others it followed an acute infection of the respiratory tract Three patients had pendontal abscesses (associated in one with a furuncle on the side of the neck and in the other with an infection of the respiratory tract) In the remaining cases, antecedent infections included cystitis (with catheterization), pilonidal sinus (with instrumentation) uterine infection subsequent to abortion, and cellulitis of the finger, scalp and back. There was considerable variability in the interval between the initial infection and the onset of symptoms indicating vertebral or epidural infection This interval was one week or less in six cases two weeks in four cases, and one to three months in six cases. In the remainder, the period was even longer

In every instance, the examiner's attention was first drawn to the spine by the complaint of pain. Twenty two patients described pain in the back. In six of these, radicular pain appeared almost simultaneously, in six others it followed after a period which ranged from a few days to a few months. Radicular pain alone, as the first symptom of spinal or intraspinal disease, was uncommon occurring in only three of the 25 patients. The pain in the back was severe and either lancinating or boring It was increased by coughing straining, or motion. Symptoms referable to the spinal cord usually followed the onset of pain in a relatively short time This interval was one week or less in nine cases, one to two weeks in four cases, and two to three weeks in four cases The longest interval between pain and spinal cord symptoms was eleven months, the shortest was twelve hours The chronologic order in which symptoms referable to the spinal cord became apparent differed widely among the patients The most common initial symptom was weakness of the extremities below the level of the lesion but disturbance of spinal cord function was also indicated by numbness of the extremities and by urinary incontinence and retention. Regardless of the order in which they appeared, weakness, numbness, and urinary retention or incontinence followed each other in rapid succession. In eight cases, the progression of these symptoms from onset to the point of advanced alteration of spinal cord function occurred in two days or less On several occasions, it was observed that the pain in the back diminished or ceased with the establishment of numbness.

The abnormal physical findings were of two types local signs referable to the spine and neurologic manifestations of spinal cord dysfunction Four patients had redness and swelling of the skin about the vertebral column Thirteen had tenderness of one or more spinous processes Reluctance to alter the position of the back was evident in almost all Neurologic man-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Neurology and Psychiatry May 21 1948.

festations varied widely among the different patients Two patients had only hyperreflexia of the lower extremities and bilateral Babinski signs Eleven patients had evidence of moderately advanced spinal cord dysfunction, indicated by paresis of the extremities, tendon hyperreflexia, Babinski signs, and diminution of sensory perception below a definite level In seven patients, the interruption of the spinal cord was markedly advanced Below the level of the lesion, only isolated manifestations of spinal cord function were preserved, such as a tendon reflex, slight motion of the toes, or a small area in which sensation was perceived Five patients had apparently complete functional interruption of the spinal cord Below the level of the lesion, voluntional movements were absent, reflexes could not be obtained, and sensory perception was lost

The diagnosis was usually suspected because of the severe pain in the back, the rapid advance of neurologic disturbances, and the history of preexisting infection Auxiliary procedures were frequently of little value Fever and leukocytosis were absent in three patients In the remainder, the significance of these findings was obscured by the presence of associated inflammatory processes Roentgenograms of the spine were obtained in 16 cases, but this examination demonstrated osteomyelitis in only three of these Myelograms were obtained in seven cases, but in only five did this examination show obstruction of the subarachnoid space This procedure was not utilized more frequently because the location of the lesion was usually indicated with accuracy by tenderness of the spine and by the level of the sensory defect Furthermore, once the diagnosis was established with reasonable certainty, laminectomy was performed with a minimum of delay The Queckenstedt test was performed in 18 cases, and in 15 a partial or complete occlusion of the subarachnoid space was demonstrated The protein content of the cerebrospinal fluid was normal in one case and elevated in 12 (ranging from 52 to 1,180 mg per 100 cc) The cellular content of the cerebrospinal fluid was below 10 per cu mm in three cases and varied from 10 to 1,350 per cu mm in nine Culture of the cerebrospinal fluid from six patients yielded no growth in three, pneumococcus in one, and Staphylococcus aureus in two

Six patients were not subjected to operation Of these, three were moribund at the time they came under observation The presence of an epidural abscess was not recognized until postmortem examination was made in the other three (encountered early in our experience) Of the 19 patients upon whom laminectomy was carried out, six recovered, four were improved and ambulatory, two were improved but remained invalid, two were unimproved, and five died Among those who recovered, it was possible in each instance to relate the satisfactory result to some particular feature of the case Three patients had granulomas rather than abscesses, and the course of the disease was slow In the fourth, an abscess was drained when hyperreflexia and Babinski signs were the only evidence of spinal cord involvement In the fifth, operation was performed eighteen hours after the onset of neurologic symptoms In the sixth, the abscess was drained by spinal puncture on several occasions before operation Therefore, it would seem that a successful result is associated with drainage at an early stage or with a process that advances slowly

Pathologic changes associated with epidural infection were found in the extraspinal muscles, the vertebrae, and the intradural structures Three patients had paraspinal abscesses which seemed to communicate with the epidural space Osteomyelitis was found in 15 patients The gross alterations of the bone varied from softness and hyperemia to extensive destruction and sequestration The abscess in the bone was most often found in the vertebral arch (11 cases) but also occurred in the body (4 cases) Frequently, as the laminae were removed with a rongeur, a drop of pus would be expressed from the bone, but the exact spot from which it came was difficult to determine While the presence of bone involvement was sometimes obvious, its demonstration at other times required careful search, even at autopsy Osteomyelitic areas were observed at various levels from the fourth cervical to the third lumbar vertebrae, with a preponderance in the midthoracic region On six occasions, there was an infection of two or more adjacent vertebrae

The inflammatory processes in the epidural space assumed three forms presuppurative, suppurative, and granulomatous In the patient operated upon eighteen hours after the onset of neurologic symptoms, there was exposed an epidural mass of swollen, reddish, friable fat that was considered an inflammatory lesion that had not yet become suppurative Granulomas which varied in length from one to eight vertebral segments were found in six patients These were masses of granulation tissue which lay on the dorsal aspect of the dura mater and sometimes resembled an epidural neoplasm They were flat or semicylindric, with localized enlargements that tapered toward each end and merged with the epidural fat It was occasionally impossible to detect a line of demarcation between the granuloma and the dura mater, and the lesion sometimes appeared to be a gross thickening of the dura mater rather than a granuloma superimposed upon it Although the granulomas were not associated

with free pus, histologic examination often showed small abscesses within their substance

In 18 patients, there was found free pus The smaller abscesses lay in little pockets within the epidural fat, the surrounding fat being brownish, edematous, and granular In most instances, the pus extended along one to three vertebral segments. In contrast to the small collections of pus were the large abscesses exposed in two patients The purulent material extended for a distance of 16 vertebral segments in one and 19 in the other and seemed to be unencapsulated Under such conditions, it is apparent that an unsuspecting examiner could introduce infection into the subarachnoid space by performing lumbar puncture It is our present belief once the diagnosis of epidural abscess is seriously entertained that the information obtained by lumbar puncture hardly warrants the risk which attends the procedure Pus was found at various levels from the fourth cervical to the fifth lumbar vertebrae It has been stated that an epidural space exists only on the dorsal and dorsolateral aspects of the dura mater and that epidural abscesses are limited to this region [2] However we encountered two patients with collections of pus anterior to the dura mater In each, the abscess was associated with osteomyelitis of the body of the vertebra, and autopsy permitted verification of the fact that the pus lay between the posterior longitudinal ligament and the dura mater [3,4] Furthermore, Di Stasio has reported the case of a patient with an abscess lying in the anterolateral part of the epidural space [4]

Cultures were obtained from the epidural lesions of 19 patients. The responsible organism was Staphylococcus aureus in sixteen while a pneumococcus a gram-positive coccus and a gram-negative diplococcus, respectively were obtained from the other three

The dura mater in the region of epidural infection showed thickening and infiltration by leukocytes Neutrophils and lymphocytes were found in the subdural and subarachnoid spaces, with organization occurring in areas where the exudate was dense To a much lesser extent there was cellular infiltration of the pia mater Small blood vessels in the subarachnoid space and on the surface of the spinal cord showed varying degrees of thrombosis organization and recanalization. Within the spinal cord there were observed vacuolization of the white matter, destruction of myelin gliosis, and degenerative changes of the neurones. Similar alterations have been described by Hassin and Weilbaecher [5,6] We were unable to demonstrate any examples of suppurative myelitis, although Weil states that such may occur in association with vertebral osteomyelitis [7]

[*] Fig. 6, page 11.

Nine patients were examined postmortem The common findings were decubitus ulcers and infections of the urinary tract, with septic infarcts in the lungs kidneys, and spleen. Purulent meningitis was disclosed in five cases

Of the 19 patients on whom laminectomy was performed, 11 received penicillin and/or sulfonamides and eight did not. The over-all results in the two groups were not significantly different The comparison however does not afford a fair evaluation of the effect of these therapeutic agents, since in most instances their administration was begun after alterations in spinal cord function were well established

We have had additional experience with two patients (not included in the series) that indicates more clearly the probable beneficial effect of sulfonamides and antibiotics when administered early in the course of the disease One patient, subsequent to an infection of the respiratory tract, developed severe boring pain in the interscapular region This was accompanied by fever and leukocytosis On the next day, there appeared pain along the left costal margin Neurologic examination revealed absence of the left abdominal reflexes and the presence of Babinski signs bilaterally The Queckenstedt test demonstrated a patent subarachnoid space Intensive treatment with penicillin and sulfonamides was followed by recovery in ten days.

The second patient subsequent to an acute thrombophlebitis of a lower extremity associated with meningitis developed sudden stabbing pain in the back. Examination disclosed only tenderness of the fourth lumbar spinous process. Serial roentgenograms revealed a constant defect in the left lamina of the fourth lumbar vertebra Intensive treatment with penicillin was instituted The spontaneous pain disappeared in a few days, but the patient continued to have pain when attempts were made to change the position of the back, and coughing or laughing produced radiating pains in the posterolateral aspects of the thighs. After five weeks of treatment the patient's condition was considerably improved and roentgenograms showed only a small residuum of the lesion originally observed in the lamina. In both of these cases it was believed that osteomyelitis of the vertebra had been successfully treated with sulfonamides and penicillin before significant changes in the nervous system had become established

Kaplan and Read have reported a comparable case.[8] This concerned a patient who developed osteomyelitis of a cervical vertebra subsequent to furunculosis Neurologic examination disclosed only atrophy and paresis of the supra and infra spinatus muscles bilaterally The patient was

treated with penicillin and made an uneventful recovery in thirty-eight days

Discussion

Several features of this disease contribute to a concept of its pathogenesis The initial symptom was usually pain in the back, and this pain was persistent, boring, and considerably more severe than that which accompanies spinal cord tumor It resembled the pain that is characteristic of bone infections elsewhere in the body Furthermore, in every case the pain preceded the neurologic symptoms by days or months Consequently, we believe that epidural infection is usually preceded by osteomyelitis of the vertebrae This assumption is supported by the fact that epidural abscesses extending over many vertebral segments are frequently accompanied by osteomyelitis of only one vertebra It seems more reasonable to us to assume that the osteomyelitis preceded the abscess rather than to assume that an extensive abscess produced secondary infection of only one of the many adjacent vertebrae The production of changes in the spinal cord by epidural infection is probably due to several causes In view of the large size of some of the inflammatory processes in the epidural space, compression of the spinal cord must be considered as one factor However, the presence of a patent subarachnoid space in some patients and the relative infrequency with which distortion of the spinal cord can be demonstrated at autopsy suggest that compression is not the only factor Thrombosis of blood vessels in the subarachnoid space and on the surface of the spinal cord has been demonstrated to a degree that makes this pathologic process worthy of some consideration Finally, as suggested by Hassin, some significance must be attached to the stasis of tissue fluids in the spinal cord secondary to compression of the perineural spaces about the spinal roots [5]

Experience has amply demonstrated that the results of surgical drainage of an epidural abscess after the spinal cord is affected leave much to be desired On the basis of our experience, we believe that osteomyelitis of the vertebra can frequently be recognized in an early stage and that the prompt and adequate use of sulfonamides and penicillin may prevent the establishment of an extensive epidural infection Furthermore, we believe that the syndrome is so characteristic that its recognition depends only upon acquaintance with the symptomatology

Conclusions

1 Pyogenic infection in the spinal epidural space produces a syndrome that should be readily recognizable clinically

2 The pathologic findings strongly suggest that vertebral osteomyelitis precedes the establishment of infection in the tissues of the spinal epidural space

3 Clinical experience indicates that the use of penicillin and sulfonamides during the early stage of what is considered to be osteomyelitis of the vertebrae may inhibit extension into the epidural space

4 Evidence of implication of the spinal cord makes immediate drainage by laminectomy imperative

THE SANATORIUM AND LIFE

It is shortsighted to spend a great deal of time and money in developing an excellent medical program for the treatment of tuberculous patients without at the same time providing some form of supervised activity for patients with a favorable prognosis to enable them to bridge the gap between the sheltered life in a sanatorium and the life of the workaday world — *American Review of Tuberculosis, January, 1947*

NEW CHOLERA DRUG DEVELOPED

A new drug effective against cholera has been developed in the laboratories of Columbia University's College of Physicians and Surgeons Known as phthalylsulfacetimide, the drug was used on more than 500 patients in Egypt during a recent epidemic Mortality among 43 patients treated was only 2 per cent, as against 49 2 per cent among 20,781 untreated Experimental work was done by Doctors Harry Sobel and Edward Henderson

PRACTICAL ASPECTS OF CEREBRAL VASCULAR ACCIDENTS

H Houston Merritt, M D , New York City

(From the Montefiore Hospital)

CEREBRAL vascular lesions are the most common causes of generalized or focal disturbances of the brain The patient with a cerebral vascular lesion is usually not seen by the physician until there has been a sudden and dramatic onset of neurologic symptoms. The physician is called to see a patient with a clinical picture which is commonly described by the term 'stroke' or "shock." Although there are differences in the mode of onset the symptomatology, and clinical course in the various types of cerebral vascular lesions the general picture may be quite similar, and it is often difficult to determine the nature of the lesion in any individual case from the clinical data The purpose of this article is to consider the common types of cerebral vascular lesions with particular regard to differential diagnosis and treatment The rare forms of cerebral vascular lesions associated with periarteritis nodosa, lupus erythematosus the blood dyscrasias, the encephalitides, and toxic states will not be discussed The common types of cerebral vascular lesions are cerebral thrombosis, intracerebral hemorrhage primary subarachnoid hemorrhage, and cerebral embolism

It is difficult to obtain accurate information regarding the relative frequency of the various types of cerebral vascular lesions Autopsy statistics are invalid because of differences in the mortality rate whereas figures based on clinical diagnosis are unreliable due to the difficulties in establishing an accurate diagnosis In a recent study (Table 1) cerebral hemorrhage constituted almost 50 per cent of 245 autopsy-controlled cases, whereas they represented only 21 per cent of the 604 cases in which the diagnosis was based on the clinical findings [1] Cerebral thrombosis was found in 43 per cent of the necropsy-controlled cases and was estimated to constitute 66 per cent of the cases diagnosed on basis of the clinical findings The diagnosis of cerebral embolism was made in 5 per cent and primary subarachnoid hemorrhage in 8 per cent of the 604 clinically controlled cases.

Although all types of cerebral vascular lesions may occur at any age (Table 2) intracerebral hemorrhage and cerebral thrombosis are uncommon before the age of forty The peak incidence of cerebral thrombosis is in the sixth to eighth decades as compared with the fifth to eighth decades for cerebral hemorrhage The incidence of cerebral embolism and primary subarachnoid hemorrhage is more evenly spread over the various decades with the greatest incidence in the fifth to seventh decades [2]

Symptoms

Premonitory Symptoms.—Premonitory symptoms of an impending cerebral vascular accident are infrequent When they occur they may be nonspecific or focal in nature. Nonspecific symptoms include headache, dizziness, drowsiness, and mental confusion One or more of *these symptoms is not infrequent in patients* with cerebral vascular disease, and their occurrence does not necessarily presage an impending "stroke"

Focal premonitory symptoms are uncommon and when present usually presage the onset of a thrombosis rather than a hemorrhage A transient loss of speech, hemiplegia or paresthesias in one half of the body may precede the onset of a severe paralysis by a few hours or days These *fleeting symptoms have been explained on basis*

TABLE 1.—The Incidence of the Various Forms of Cerebral Vascular Lesions

of spasm of the vessel They could, however, be due to thrombosis of small terminal twigs of the parent trunk. Paralysis of one of the cranial nerves as the result of compression by an aneurysm may be present for several weeks or months before rupture of the aneurysmal sac

Symptoms at Onset of "Stroke"—In the vast majority of the cases the symptoms of a cerebral vascular accident are of sudden onset and reach the maximum intensity within a few minutes or a few hours at the most These symptoms may again be divided into two groups, focal and generalized The focal neurologic symptoms, such as paralyses, sensory loss, and speech defects, are related to the site of the hemorrhage or infarct These will not be discussed in detail since they are of only secondary importance in regard to the differential diagnosis

The generalized symptoms include headache, vomiting, convulsions, and coma These symptoms may occur in any type of cerebral vascular accident, but they are more common in patients with an intracerebral or subarachnoid hemorrhage

Coma, the most dramatic initial symptom of cerebral vascular accident, occurs at the onset in 51 per cent of the patients with a cerebral hemorrhage, in 33 per cent of cerebral thromboses, in 25 per cent of the patients with a cerebral embolus, and in 30 per cent of the patients with a primary subarachnoid hemorrhage

Convulsions, usually generalized but occasionally jacksonian in character, occur at the onset or within a few hours in 15 per cent of the patients with cerebral hemorrhage, in 7 per cent of cerebral thrombosis, in 9 per cent of the patients with a cerebral embolism and in 15 per cent of subarachnoid hemorrhage

Vomiting is present at the onset in about 50 per cent of the noncomatose patients with a cerebral or subarachnoid hemorrhage, in 25 per cent of the cerebral emboli, and in only 16 per cent of cerebral thromboses

Headache as an initial symptom occurs in approximately 63 per cent of the noncomatose patients with a cerebral hemorrhage, 25 per cent of cerebral emboli, in 6 per cent of the cerebral thromboses, and in almost 100 per cent of the patients with a primary subarachnoid hemorrhage

Signs

If the hemorrhage is a small one or if a minor vessel is occluded by a thrombus or embolus, there may be no change in the vital signs With a large hemorrhage or occlusion of a major vessel, the temperature is elevated, the pulse rate is increased, and the rate and depth of the respirations are altered Failure of the vasomotor and heat-regulating centers is a constant finding in patients with any type of fatal cerebral vascular accident There is a uniform rise of temperature, pulse rate, and respiratory rate several hours or days before death occurs

Since arteriosclerosis and hypertension are the most frequent causes of both intracerebral hemorrhage and thrombosis, evidence of sclerosis of the peripheral and retinal vessels abnormalities in the heart, and changes in the blood pressure are common findings Clinical signs of cardiac enlargement or auricular fibrillation are present in over 90 per cent of the patients with a cerebral embolus Cardiac enlargement is present in approximately two thirds of the patients with a cerebral hemorrhage or thrombosis, but auricular fibrillation is relatively rare Arteriosclerosis and hypertension are common findings in the patients with a primary subarachnoid hemorrhage after the age of forty

The blood pressure is within normal limits in the majority of patients with a cerebral embolus, but it is usually elevated in patients with a cerebral hemorrhage, subarachnoid hemorrhage, or thrombosis However, these lesions may occur in a patient with a normal blood pressure (Table 3)

Pupillary findings in cases of cerebral vascular lesions are quite variable, depending on the time the examination is made and the presence of other complicating factors, such as syphilis and changes in the pupillary reactions associated with old age Inequalities in the size of the pupil are common, and the larger pupil is usually on the side opposite to the cerebral lesion The reaction of the pupils to light is lost or greatly impaired in over 25 per cent of the patients with a cerebral hemorrhage and in less than 10 per cent of the cerebral thromboses Conjugate deviation of eyes alone or the head and eyes together is frequently present in the patients with evidence of a severe cerebral lesion It is more common following an intracerebral hemorrhage than after other types of lesions The deviation is almost always toward the side of the lesion and is associated with impairment of the movements of

TABLE 3.—THE SYSTOLIC BLOOD PRESSURE IN AUTOPSY PROVED CASES OF CEREBRAL VASCULAR LESIONS (IN PERCENTAGES)

100–139	10	11	32	30
140–159	10	18	32	13
160–199	39	45	15	20
Over 200	40	26	5	37
	100	100	100	100

* Not autopsy controlled.

the head and eyes to the opposite direction The deviation of the head and eyes tends to disappear with improvement in the general condition of the patient

Stiffness of the neck is an almost constant finding in patients with an intracerebral or primary subarachnoid hemorrhage and is related to the presence of blood in the cerebrospinal fluid It is rarely present in patients with a cerebral thrombosis or embolus.

Mental symptoms and signs—confusion, disorientation, and impairment of memory—are frequently present in the period immediately following a cerebral vascular accident These are related in part to the generalized focal disturbance of cerebral function associated with the vascular lesion and in part to cerebral arteriosclerosis

The presence of signs of focal brain damage hemiplegia aphasia hemianopia, and the like is related to the site of the lesion Changes in the tendon reflexes and the plantar responses can usually be explained on the basis of the focal lesion All of the tendon reflexes may be lost when the patient is in the comatose state immediately following the onset of the vascular lesion but it is more common for the reflexes to be hyperactive on the side opposite to the focal cerebral lesion The plantar response is extensor (Babinski s sign) in type in 25 per cent of the patients with blood in the cerebrospinal fluid and in approximately 15 per cent of the patients with a cerebral thrombosis or embolus in the period immediately after the onset of the lesion

Laboratory Data

Albumin and casts are found in the urine in a high percentage of the patients, regardless of the type of the vascular lesion This is usually due to associated renal disease and may be accompanied by an elevation of the serum nonprotein nitrogen content. Transient hyperglycemia and glycosuria in the absence of diabetes mellitus is not infrequent. It is probably due to a temporary disturbance in the sugar metabolism as a result of the cerebral injury It cannot be correlated with the site of the lesion but it is noted more frequently in patients with a hemorrhage than in those with thrombosis or embolism. A leukocytosis of 12,000 or over is present in over 50 per cent of the patients with a cerebral or subarachnoid hemorrhage and in approximately 10 per cent of the patients with a cerebral thrombosis. A white blood count greater than 20 000 is diagnostic of a hemorrhage unless there is a concomitant infection

The cerebrospinal fluid pressure is usually normal in patients with a cerebral embolus or thrombosis Pressures between 200 and 300 mm. are present in a small percentage of the cases, but readings greater than 300 are rarely seen. In contrast, the pressure is greater than 200 mm in the majority of the patients with an intracerebral or primary subarachnoid hemorrhage.

The cerebrospinal fluid is bloody in all of the patients with a primary subarachnoid hemorrhage, in 75 per cent of the cases of cerebral hemorrhage, and in 15 per cent of the cases with cerebral embolism. It is clear in cerebral thrombosis, although there may be a slight xanthochromic tinge with a few red blood cells on microscopic examination

The Wassermann or other specific tests for syphilis are negative in the clear cerebrospinal fluids unless syphilis of the central nervous system is present. The presence of a positive reaction in a bloody fluid cannot be accepted as evidence of syphilis of the nervous system since it may be due to the presence of syphilitic reagin in the blood serum present in the fluid The test should be repeated after an interval sufficient for the cerebrospinal fluid to become clear has elapsed

Clinical Course

The course of patients with cerebral vascular lesions depends on the type and extent of the lesion and the presence or absence of other complicating factors The prognosis for life is grave if there has been a hemorrhage of any appreciable size or if a major vessel is occluded by a thrombus or embolus When a small vessel is the site of a thrombus or an embolus the patient is usually able to survive the insult unless the complicating factors are serious enough to cause death.

In the fatal cases the duration of life after the onset varies from a few hours to two months Cerebral vascular accidents, except as noted below are not a cause of sudden death (within minutes) Death may occur within a few minutes when a large aneurysm ruptures into the subarachnoid space and death within twelve hours is most common in this type of cerebral vascular accident (Table 4) Death occurs within three to twelve hours in a few cases of cerebral hemorrhage, but as a rule it is delayed for a period varying from one to fourteen days. Occasionally a patient with a cerebral hemorrhage may live several months and die as a result of the hemorrhage Death within twenty four hours is rare in patients with a cerebral thrombosis or embolus Death in these cases most commonly occurs several days to several weeks after the onset, but it may occur several months later as the result of complications.

The vascular accident is the chief or sole cause of death in the various types of cerebral vascular accidents as follows intracerebral hemorrhage

TABLE 4.—Length of Survival in 243 Cases of Fatal Cerebral Vascular Lesions (in Percentages)

Length of Life After Onset	Hemorrhage (115 Cases)	Thrombosis (89 Cases)	Embolism (21 Cases)	Primary Subarachnoid Hemorrhage (18 Cases)
Less than 12 hours	4	0	0	22
12 to 24 hours	3	1	0	11
1 to 4 days	41	30	38	28
5 to 14 days	39	39	38	11
2 weeks to 2 months	12	23	19	22
2 months to 6 months	1	7	5	6
	100	100	100	100

40 per cent, primary subarachnoid hemorrhage (first attack) 35 per cent, cerebral thrombosis 25 per cent, and cerebral embolus 30 per cent The common contributory causes of death in patients with an intracerebral hemorrhage, primary subarachnoid hemorrhage, or cerebral thrombosis are bronchopneumonia, cardiac failure, uremia, lobar pneumonia, diabetes mellitus, and pulmonary infarct Additional contributory causes of death in patients with cerebral embolus include vegetative endocarditis and embolic phenomena in other parts of the body

As a rule, the general symptoms are also most intense immediately after the onset, but occasionally in the fatal cases there may be an increase in the depth of coma or a lapse into coma several hours after the onset

The focal neurologic symptoms are most severe immediately following the onset of the cerebral vascular accident There are a few exceptions to this rule In a small percentage of the cases of cerebral hemorrhage there may be an increase in the severity or extent of focal neurologic symptoms over a matter of a few hours This progress in neurologic signs can be explained by an increase in the size of the hemorrhage Progression of focal neurologic signs is rare in patients with a cerebral thrombosis or embolism Progression in such cases can be explained by an independent involvement of other vessels or by the propagation of the thrombus to the point of origin of another branch of the thrombosed vessel

The prognosis for return of function of paralyzed members cannot be predicted with any degree of certainty in the first few days or weeks In the nonfatal cases there is usually some improvement in the focal neurologic signs In some cases this improvement may be very dramatic with complete resolution of all signs within a few hours or a few days The hypothesis of a cerebral vascular spasm is used by some authors to explain the fleeting nature of the symptoms in such cases More commonly, the improvement of symptoms takes place slowly, with improvement for a matter of several months Usually, the patient is left with some permanent residual symptom, such as stiffness and difficulty in the use of the leg in walking, awkwardness in the use of the hand, or some degree of speech defect In the occasional case there will be no improvement for several weeks but a gradual and appreciable improvement in the following months For this reason, treatment of the neurologic defect should not be given up as hopeless until at least six months have elapsed

Differential Diagnosis

The differential diagnosis in patients suspected of having a cerebral vascular accident is twofold First, they must be differentiated from other lesions of the nervous system, second, an attempt should be made to determine which form of cerebral vascular accident is present

The differential diagnosis from other lesions of the nervous system is usually not difficult when the complete history of the patient's illness is known, but it is often extremely difficult when the patient is found in a comatose state and there is no adequate history in regard to the onset of the coma In such cases a careful examination of the patient and the judicious use of certain laboratory tests are necessary The laboratory procedures of greatest value are the examination of the urine the determination of the nonprotein nitrogen and sugar content of the blood, and examination of the cerebrospinal fluid

The patient's head should be examined carefully for evidence of external injury, and the size and reactions of the pupils and the odor of the breath should be noted The optic disks should be examined The character of the respirations, the temperature, pulse rate, and blood pressure are important The presence or absence of stiffness of the neck should be noted

It is of paramount importance to determine whether a *hemiplegia* is present This is not simple in a comatose patient but can usually be done The face should be carefully observed, and if there is a puffing out of one cheek with each expiration, there is a paralysis of that side of the face Paralysis of the extremities can be determined by lifting each extremity and allowing it to fall If the coma is not too deep, the paralyzed limb will fall heavily, while the unparalyzed limb will gradually sink to the bed When the patient is in deep coma, all limbs may fall heavily to the bed Vigorous stimulation of the soles of the feet by a blunt stick or key will cause a withdrawal of the unparalyzed limb, while the paralyzed limb will remain inert

A hemiplegia of sudden onset together with a marked degree of hypertension is presumptive evidence of a cerebral vascular lesion The diagnosis of uremia or an expanding lesion in the

cerebrum, such as brain tumor, brain abscess and subdural hemorrhage, cannot definitely be excluded, however If there is no hemiplegia and the blood pressure is normal, coma due to diabetes, acute alcoholism, extradural or subdural hemorrhage or drug poisoning must be considered

The odor of acetone on the breath and the presence of sugar in the urine (which may have to be obtained by catheterization) are in favor of diabetes It must be remembered, however, that a transient glycosuria and hyperglycemia occur in a definite percentage of the cases of cerebral hemorrhage or thrombosis. The determination of the sugar content in the blood will aid in establishing or excluding the diagnosis of diabetic coma, since the rise in blood sugar which occurs with cerebral vascular accidents is rarely as high as that commonly seen in diabetic coma

The presence of albumin and casts in the urine are in favor of uremia, but the diagnosis cannot be definitely established without a determination of the nonprotein nitrogen content of the blood It must also be remembered that cerebral vascular lesions are a common complication of uremia

An alcoholic odor to the breath, a normal blood pressure, no evidence of a hemiplegia, and a normal cerebrospinal fluid are the characteristic findings in cases of coma due to acute alcoholism The cerebrospinal fluid pressure in these cases may be slightly elevated (200 to 300 mm)

Cases of extradural hemorrhage are usually easy to differentiate from cases of cerebral vascular lesions The differential is important since the treatment is immediate operation with removal of the clot and ligation of the middle meningeal artery The presence of contusions or lacerations of the scalp indicative of a head injury is important It must be remembered, however, that a patient with a cerebral hemorrhage or thrombosis may fall and injure his head X-rays of the skull and an examination of the cerebrospinal fluid is often of aid The typical sequence of events in patients with an extradural hemorrhage resulting from trauma is as follows an immediate period of coma from which the patient recovers a lucid interval of several hours duration which is followed by a gradually increasing stupor and the development of a hemiplegia This classic history is present in only about one half of the cases, because there may be sufficient trauma to the brain to produce a prolonged coma which merges with the coma resulting from the pressure of the extradural clot If there is a fracture of the skull which passes through the groove of the middle meningeal artery the diagnosis of extradural hemorrhage should be made

The diagnosis of subdural hemorrhage is often difficult It is important that the diagnosis be made promptly because immediate operation is necessary to save the patient's life The differential diagnosis is further complicated by the fact that the head injury which produced the subdural hemorrhage may have been only a slight or moderate one and an interval of several days or weeks may separate it from the symptoms produced by the hematoma In addition, the coincidence of hypertension and subdural hematoma is frequent. If there is a history of a recent head injury and there are fluctuations in the patient's state of consciousness, the diagnosis of subdural hematoma should be considered The frequent association of subdural hematoma with chronic alcoholism should be kept in mind X-ray examination and examination of the cerebrospinal fluid is of value in the differential diagnosis The presence of a fracture of the skull or displacement of a calcified pineal gland are in favor of the diagnosis of a subdural hematoma The finding of a bloody or xanthochromic cerebrospinal fluid under increased pressure excludes the diagnosis of cerebral thrombosis but does not differentiate between subdural hematoma and intracerebral or primary subarachnoid hemorrhage. Whenever the diagnosis of subdural hematoma cannot be excluded by the history and the findings on examination small trephine openings should be made in the temporal region of the skull on *both* sides. It is not uncommon to have false localizing signs in subdural hematomas, and in addition, it is not rare to find a clot in both the subdural spaces

In cases of brain tumor or brain abscess the onset of the hemiplegia is usually gradual and preceded by a history of headaches vomiting, or convulsions for several months. The presence of 'choked disks ' a normal blood pressure, an increased cerebrospinal fluid pressure, and a clear or slightly yellow cerebrospinal fluid with a normal cell count and an increased protein content are the characteristic findings in cases of brain tumor Exactly similar findings are present in cases of brain abscess except that the cerebrospinal fluid usually shows a mild or moderate pleocytosis

The history of numerous previous convulsions and the occurrence of a convulsion before the onset of the coma together with a normal blood pressure and a normal cerebrospinal fluid are in favor of the diagnosis of epilepsy

The differential diagnosis between the various types of cerebral vascular lesions is important chiefly in regard to the prognosis as to recovery from the "shock and as to the degree of recovery from the focal neurologic signs. The diagnosis of the cerebral hemorrhage or primary subarachnoid hemorrhage carries with it a grave import as to the life of the patient and the chance of

complete recovery from any paralysis that may be present

The diagnosis of cerebral embolism is indicated whenever there is a sudden onset of neurologic symptoms in a patient with an acute or chronic endocarditis, auricular fibrillation, a recent coronary thrombosis, septicemia, or a septic focus These cases often present clinical evidence of embolic phenomena elsewhere in the body

Primary subarachnoid hemorrhage must be differentiated from intracerebral hemorrhage [3 4] Headache is a prominent symptom, and signs of meningeal irritation, stiffness of the neck and Kernig's sign develop rapidly, but focal neurologic signs, such as hemiplegia or aphasia, occur in less than 20 per cent of the cases The presence of a bloody spinal fluid and a hemiplegia indicates that there has been an intracerebral hemorrhage and is against the diagnosis of a primary subarachnoid hemorrhage It must be remembered, however, that an aneurysm may be so located that it bleeds into both the subarachnoid space and the cerebrum when it ruptures Paralysis of the third or other cranial nerves is in favor of the diagnosis of primary subarachnoid hemorrhage

The differential diagnosis between cerebral hemorrhage and thrombosis is difficult since focal neurologic signs are similar in both and since both occur in patients of the same age group and in patients with arteriosclerosis and hypertension A freshly bloody cerebrospinal fluid is diagnostic of a cerebral hemorrhage In the absence of blood in the cerebrospinal fluid or if a lumbar puncture is not performed, there are several points in the history and physical examination that will make it possible to make this differential in the majority of the cases The presence of the signs and symptoms listed below are in favor of the diagnosis of an intracerebral hemorrhage (1) convulsions at the onset, (2) the occurrence of severe headache, nausea, or vomiting at the onset, (3) Cheyne-Stokes or labored respirations and conjugate deviation of the eyes, and (4) stiffness of the neck, quadriplegia, and bilateral Babinski toe sign

Treatment

The treatment of patients with cerebral vascular accidents is separated into two parts first, the treatment in the immediate period after onset, which is mainly devoted toward saving the life of the patient, and second, the treatment of residual defects

In the first stage, skillful nursing care is essential The patient should be kept in a quiet room Fluids and liquid nourishment should be given by mouth if the patient is conscious If the patient cannot swallow, glucose solution (5 per cent) should be given subpectorally or into the thighs The bladder should be emptied by catheterization if necessary and the bowels kept open by enemas or cathartics The position of the patient in bed should be changed frequently to prevent the development of hypostatic pneumonia or bed sores The bed sheets should be changed immediately when they are soiled by urine or feces Sedatives should be used with care and the opiates avoided, since they tend to depress the respiratory centers

There is no very satisfactory medical treatment for the cerebral lesion Gilbert and de Takats recommend blocking the cervical sympathetic trunk with procaine on the side of the lesion in an effort to relieve the collateral stasis, vasoparalysis, and edema which accompanies the vascular insult [5] The increased intracranial pressure which often accompanies an intracerebral or subarachnoid hemorrhage can be treated by removal of fluid by lumbar puncture or by the administration of hypertonic solutions by vein or by rectum Care should be taken not to dehydrate the patient excessively

The chief danger in patients with cerebral hemorrhage is death from collapse of the vital centers, which is almost certain to occur if the bleeding continues There is no known method of hastening the cessation of the hemorrhage from a ruptured vessel Venesection, which was formerly recommended, is of no value unless it is used to combat polycythemia or congestive heart failure Special treatment, such as transfusions or the administration of vitamin K, is of little value unless the bleeding is related to systemic diseases such as purpura

The therapeutic value of lumbar puncture in patients with an intracerebral hemorrhage is unproved It is unlikely that the removal of cerebrospinal fluid will increase the bleeding, and it may be of considerable value in relieving the increased intracranial pressure, especially when a large amount of blood has been extravasated into the subarachnoid space If, however, the mass of the clot is confined to the substance of the cerebrum, the removal of cerebrospinal fluid is not effective in reducing the intracranial pressure Lumbar puncture can be performed as a diagnostic measure, and it may be repeated at intervals of twelve to twenty-four hours if large amounts of bloody fluid can be removed

Since cerebral hemorrhage usually results in death and since the clot is slowly absorbed and is apt to behave like a tumor, the question of operative removal of the clot should be considered in all patients who survive the initial shock of the hemorrhage [6] Such operations have proved of life-saving value in a number of cases and are of benefit in decreasing the severity of the neuro-

logic defect Unfortunately the extremely poor general condition of the patient is a deterrent to a widespread use of this form of treatment At the present time, operative removal of the clot is most suitable in those patients who have survived the initial shock of the hemorrhage and who continue to show evidence of increased intracranial pressure

There is some disagreement as to the value of lumbar puncture in the treatment of patients with a primary subarachnoid hemorrhage Experience has shown however that improvement in the clinical state of the patients follows the removal of cerebrospinal fluid and the reduction of cerebrospinal fluid pressures. Punctures should be repeated as frequently as required to keep the cerebrospinal fluid pressure at normal level

Since recurrence of the bleeding is apt to occur in patients with a primary subarachnoid hemorrhage, consideration should be given to measures directed at localizing and treating the aneurysm If the site of the aneurysm is not evident from the clinical signs it must be localized by cerebral angiography [7] In general there are two methods of relieving pressure on the aneurysmal sac The first and least serious method is ligation of the internal carotid artery on the side of the aneurysm. The second is exposure of the aneurysm by craniotomy and ligating the vessel on both sides of the sac (trapping) [8] Ligation of the internal carotid artery should not be performed until it has been shown that occlusion of the carotid artery by manual compression for periods as long as thirty minutes can be tolerated by the patient without the development of symptoms. Even with this assurance of competency of the collateral circulation ligation of the internal carotid artery may be followed by the development of a contralateral hemiplegia Ligation of the aneurysm at craniotomy is a major surgical procedure and is accompanied by a high mortality rate. The decision regarding the applicability of either type of operation is a delicate one and although no set rule can be established it would seem wise to defer operation until there is evidence of one recurrence of the bleeding

After the patient has recovered from the 'shock' of the cerebral vascular accident the therapy should be directed toward restoration of function in the paralyzed limbs Light massage of the muscles and passive movements of the affected limbs are useful in maintaining the proper circulation and nutrition of the paralyzed muscles and help to prevent the development of arthritic changes in the joints It is of great importance to encourage the patient to try to use the paralyzed muscles The first voluntary movements should be aided by simultaneous passive movements of the joints Systematic passive movements of all the joints of the affected arm and leg should be made for a few minutes several times a day The patient should be encouraged to try to move the joints while the physiotherapist is doing so These exercises should not be unduly prolonged as the patient will tire and become discouraged The patient should be given a soft rubber ball to hold in his hand and instructed to exercise the fingers by squeezing the ball and by placing it on the bed or table and picking it up With return of function more skillful actions should be tried If there is any tendency toward the development of contracture in the extremities, well padded removable splints should be applied. These splints need be kept on only a portion of each day

When the patient has regained sufficient strength and his general condition permits he should be allowed up in a chair for a few minutes This interval can be increased daily as the condition of the patient warrants Attempts at walking should be aided at first by allowing the patient to lean on an attendant's shoulder A cane should be substituted as soon as practicable and thus discarded only when the strength of the trunk and leg muscles is sufficient to support the patient

The treatment of aphasia or disorders of speech is difficult and requires infinite patience on the part of the physician and persistent effort on the part of the patient Best results are obtained when re-education exercises are given by a trained speech therapist Fortunately in the majority of the cases the lesion is not centered in the speech areas and complete or nearly complete return of the power of speech may occur

In the cases of cerebral thrombosis due to or associated with a syphilitic infection of the cerebral vessels antisyphilitic therapy (penicillin) should be given.

Discussion

Paul H Garvey, M.D, *Rochester* —The subject which Dr Merritt has so ably discussed this morning is one which covers a large group of cases often neglected even in our modern hospitals Too frequently these cases are dismissed by the physician who classifies them indiscriminately as cerebral vascular accident with no attempt to visualize the cerebral pathology which in most cases brings about a sudden and dramatic change from a state of normal health to one of unconsciousness and paralysis. Even head trauma, tumors, and many other organic diseases if not too obvious are very often included in this general category

The figures presented concerning the incidence of various forms of cerebral vascular lesions are particularly informative because they represent a large series of cases based on clinical and pathologic

findings I am sorry that I did not have sufficient time to review the material at the Strong Memorial and Rochester Municipal Hospitals from the statistical standpoint However, I did discuss the percentages reported by Dr Merritt with one of our pathologists whose reaction was that the figures, if compiled, would probably correspond very closely with those quoted here this morning While the incidence of intracerebral hemorrhage can be accurately determined at the autopsy table, I do not believe that the same holds true in cases of cerebral thrombosis The terms, encephalomalacia and cerebral thrombosis, are often used interchangeably by the pathologist However, in the routine autopsy practically no attempt is made to demonstrate the thrombosed vessel except in those cases where a major vessel is involved Similarly, the source of primary subarachnoid hemorrhage is often overlooked, because no careful search is made for minute aneurysms involving the vessels at the base of the brain However, in those cases where the blood is concentrated principally over the convexity of the brain, a search, regardless of how thorough, is usually fruitless

Dr Merritt has emphasized the difficulties encountered in differentiating cerebral thrombosis from the various types of intracranial hemorrhage Obviously, the age incidence and blood pressure levels are not very helpful in making the differential diagnosis, but it is worthy of note that hemorrhage has a tendency to occur at a slightly earlier age and it is true also that this diagnosis should be favored when the blood pressure reaches an excessively high level It is my opinion that the most important diagnostic aid in the differentiation between a cerebral thrombosis and cerebral hemorrhage is the lumbar puncture carefully performed This procedure should be done routinely in all hospital cases and also in the home where one is confronted with a case of suspected cerebrovascular accident In the last analysis, this is the only certain criterion by which intracranial bleeding can be determined The initial pressure of the spinal fluid, as a rule, is not greatly increased in cases of cerebral thrombosis, but definite elevation is to be expected in cases of intracranial bleeding, whether the bleeding is located in the brain or whether it is one of the various types of meningeal bleeding mentioned in the author's differential diagnosis

While speaking of the value of a lumbar puncture in cases of suspected cerebral vascular accident, a word of caution concerning the Queckenstedt test in the type of case under discussion might be in order Many physicians, house officers, and students consider that a lumbar puncture without this procedure is incomplete I believe they fail to recognize the important fact that the chief value of jugular compression is to determine the presence or absence of spinal subarachnoid block and has relatively little value in the diagnosis of intracranial conditions I feel, therefore, that the Queckenstedt test is not only inadvisable but contraindicated in cases of suspected intracranial hemorrhage, intracranial tumor, or abscess

In Table 4 of his paper, Dr Merritt has listed the period of survival in 243 cases of fatal cerebrovascular lesions of which 87 per cent of 115 cases of hemorrhage died within a period of two weeks and 70 per cent of 89 cases of cerebral thrombosis were dead within the same period of time It should be borne in mind that all of the cases listed in Table 4 are fatal cases Returning to Table 1, it might be well to point out again that the number of clinically controlled cases totals 604, compared to 245 necropsy controlled cases In other words, cerebrovascular accident does not necessarily carry with it a fatal outcome We are all acquainted with the type of hemiplegic patient encountered in homes and hospitals for chronic disease in whom paralysis has existed for five or ten years and even longer In addition to these two contrasting groups are the very fleeting hemiplegias which occur in hypertensive individuals and in those patients who apparently have a cerebral thrombosis with almost complete recovery of function Therefore, the accuracy of the diagnosis in the case of cerebral lesion is extremely important in order to arrive at a reasonable prediction concerning the outcome and management

With the basic principles of treatment as you heard them outlined this morning, I am in complete agreement It would seem to me that for patients with cerebral arteriosclerosis and hypertension where a vascular lesion has already occurred, there is very little that can be done to reverse the situation other than to apply the general measures which have been set forth On the other hand, in those cases where there is the remotest possibility of a subdural hemorrhage, I thoroughly agree with the author that bilateral bur holes should be made Then there is the problem of primary subarachnoid hemorrhage in the relatively young individual, this situation makes decision difficult and demands careful consideration relative to the proper procedure to be followed The clinical syndrome produced by aneurysms involving the anterior portion of the circle of Willis has been quite clearly established Everyone recognizes the seriousness of this problem and is well aware that it presents a picture wherein death may follow an intracranial hemorrhage by a few minutes Whether or not a direct surgical attack of these aneurysms is the solution remains to be determined In Rochester a small group of cases has been observed in which operation was performed and the aneurysm trapped, as Dr Merritt terms it Thus far, these patients have done fairly well, although the period of observation has been relatively short On the other hand, I can recall several patients living useful lives today who have had one or more attacks of subarachnoid hemorrhage over a period covering approximately sixteen years

THE FUNCTION OF A CHILD GUIDANCE CLINIC IN A CHILDREN S HOSPITAL

SHERMAN LITTLE, M D Buffalo, New York
(From the Children s Hospital)

MOST of you are undoubtedly aware of the way in which the usual child guidance clinic functions. It is an independent agency set up with community chest funds and is usually more related to social agencies than to hospitals or other medical institutions The staff consists of the coordinated team of psychiatrist psychologist, and social worker Their function is the treatment of the emotional disturbances, usually called "behavior problems " of the children who are brought to them They also render diagnostic service where this is needed, but diagnosis is not a clinic's major function Well trained physicians, teachers, psychologists, and social workers in the community should be able to make an adequate diagnosis on most cases as to whether psychiatric treatment is indicated, thus saving the time of the clinic staff for the specialized work of treatment. As I am sure you are aware, this consists of working individually with both parent and child to the end that emotional difficulties which have interfered with a healthy parent-child relationship are straightened out Emotional and psychologic growth can then proceed along the road to a healthy maturity

The need for more treatment facilities is and for a long time to come will continue to be a very pressing problem. Important as treatment is and great as is the need to my mind it is secondary to even greater needs in the field of prevention—adequate methods, programs and facilities Just as the major emphasis in tuberculosis was at one time the provision of treatment facilities, it now has changed to prevention and early detection The problem in the field of preventive mental hygiene is much greater than in tuberculosis, both in terms of number of cases needing help and in evaluating successful methods of prevention

There are however ways and means at hand for attacking the problem, and I believe that with what we now know we can if we really apply it, make a significant dent in the problem

There are a great many complex factors which contribute to emotional stability in parents and children Many of these are beyond the control of the individual Anyone living in the uncertain and complex world of today is constantly aware of this Who can be calm and relaxed patient and sensible, day in and day out in these times? However, there is good evidence to show that if the first few years of a child s life can be a reasonably calm, happy, satisfactory experience his resistance" to subsequent disturbing factors and situations will be good He will have his ups and downs, but with intelligence and sympathetic help he will weather it through There is a limit to this resistance in all of us as was shown most clearly by the war experience of men in active combat. Degrees of resistance were apparent but after a long enough period of continuous exposure essentially 100 per cent broke down Actually, this is not too striking in view of the awful situations which the men were called upon to face and yet it shatters the myth of breakdown being only the part of the weak If these men were weak, who then is strong?

What can be done to insure that children will have the kind of start that will give them "resistance?" Perhaps it is better to examine this in terms of what in the average situations, prevents a child from having a healthy happy satisfactory infancy and early childhood

Although social and economic pressures play a significant role more in some instances than in others, I do not believe that they are the largest contributing factors The emotional adjustment of the parents particularly as this is disturbed by the anxieties which are the normal complications of being a parent is to my mind, the most important factor

There is no good preparation for being a parent unless it is having a satisfactory growing-up experience oneself One might think that doctors nurses school teachers and psychologists would be the cream of the crop I need not belabor this point further Thinking, even though it be founded on the best available knowledge, usually cannot withstand the onslaught of the feelings which are stirred up because this is our baby We feel quite naturally that he is unique and beyond the rules and facts which apply to others Not even experienced pediatricians know all the answers about children s physical behavior What can you expect an inexperienced parent to know or to apply correctly when the weight of parental responsibility rests so heavily on his or her shoulders?

There are all kinds of anxieties which beset parents. There are some which should be called normal These include the uncertainty as to whether the baby is normal physically and mentally whether development is proceeding satisfactorily whether the mother is correctly feeding and caring

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Neurology and Psychiatry May 20 1918.

for her baby, and, most important, the basic anxiety which a mother has as to whether she is really capable of being a mother in the full sense of the word—whether she is really capable of helping her child to grow up This latter problem is not one that mothers discuss much or even admit to themselves It is manifested by a variety of behavior patterns, such as too much care, generalized tenseness and anxiety, a forced lack of concern, or actual indifference If things go well, it may disappear, but, if there is colic, vomiting, restlessness, or other persistent disturbing symptoms on the part of the baby, it may increase the basic anxiety in the mother and lead to an exaggeration of her pattern of behavior In some situations it can go from bad to worse so that instead of the mother getting great joy and satisfaction from her baby she may have deep inside her a great resistance against this little creature who has so terribly upset her former even existence

This may be a slightly overdrawn picture, but there are all sorts of variations, and even if rejection does not take place, the mother can be made to feel so guilty because of her inadequacies that this guilt will prevent her from using her skill and intelligence in a natural, relaxed manner She becomes anxious, tense, and stiff and does things which, under ordinary circumstances, she would never think of doing

Babies are reasonably alert creatures, and if the mother is chronically upset, you seldom find a happy or relaxed baby The mother will be incapable of picking up her crying baby and holding him in such a fashion as to relax and soothe him She may be driven by her anxieties to all sorts of extremes and excesses such as ramming food down his throat or insisting rigidly on an early pattern of toilet behavior

This is no "pipe dream" Any of you who have had opportunities to follow mothers and babies through the first few years of life can vouch for the prevalence of such situations A great deal of this, I believe, is entirely preventable if the one person who accepts, welcomes, and, indeed, guides an entry into the family during these crucial months and years knows how to help This person is the pediatrician or the family doctor His role, if he choses to play it, is to make himself the kind of person with whom the mother will feel free to share her anxieties, without fear of ridicule, criticism, or indifference It is these qualities which the mother fears, often without cause, which prevents her from sharing her fears in their incipiency with someone who can really help If the physician is aware of what mothers are going through and how hard and embarrassing it is to share it with someone else, he can skillfully help the mother to unburden herself If, by his attitude, he is sympathetic, and if, by his advice, he shows that he really understands, the mother has found a real ally She then feels free to discuss small difficulties at the start and will not feel that she must spare the doctor until she has a problem troublesome enough to interest him By that time it is of such proportion that the physician really is not interested He is filled with anxiety himself, because he does not know what to do and wishes the mother had never consulted him

Pediatricians and family doctors are not equipped by training, nor does their practice provide the time, for extended psychiatric treatment of developed behavior problems It is true that they may often have to do the best they can, because there is no one else available Psychiatric treatment on any intensive level is not and cannot be a part of their standard armamentarium They should, however, be able to understand the problem and should know enough about emotional development—which is another way of saying "human nature"—to be able to give sound advice They should be able to recognize what they can and cannot handle, just as the neurologist treats some neurologic conditions and sends others to the neurosurgeon

I have digressed somewhat since I started to talk about a child guidance clinic I want to return to it now and come back to the title of this paper The things I have been describing can and should be taught to medical students and house officers, particularly if they are going to be family doctors or pediatricians Eventually, I hope, these things will be taught by the attending physicians on the wards and in the outpatient clinics, just as how to listen to a chest or feel an abdomen is now taught That day, however, is not yet here

At present, someone has to be available who has had some special knowledge of the usual patterns of emotional growth and the factors which help or hinder its development to complement what is now taught about physical disease, its diagnosis, and its treatment Both because teaching budgets are what they are and because such a man must constantly expand his basic knowledge by treatment experience, a child guidance clinic as an integral part of a children's hospital is essential Furthermore, I am a believer in the close relationship of child guidance to clinical medicine (I am for the moment, omitting the advantages which such a clinic can offer to individual patients and their families) It is not easy to combine these functions of treatment and teaching, because the pressure for service and for treatment of individual children is tremendous However, if one sees the vital role which the informed, sympathetic physician can play in insuring that greater numbers of children can grow up to be emotionally stable, productive, and happy people, there will be no question about time being set aside for such teaching

I have not touched on the question of time involved Time or lack of it has been one of the major arguments advanced against physicians doing much in the preventive mental hygiene field Actually, doing the sort of thing that I have described briefly will save the doctors time in the long run. They will have spared themselves the frustrating experience of devoting an unscheduled hour of busy office time to an involved emotional problem in the face of which they are helpless

Discussion

Harry Bakwin, M.D., *New York City* —Dr Little has outlined the teaching plan now in operation at the Children s Hospital in Buffalo It seems to me that the best feature of this fine plan is its integration with the pediatric service Dr Little is an essential member of the staff of the Children s Service Trained as a pediatrician and a psychiatrist, he can and does speak the language of both I can attest to the value of this program from conversation with members of the staff of his hospital

At Bellevue Hospital a child guidance clinic was established in 1927 as part of the general children s outpatient department The clinic has been operated from its inception by Dr Ruth Bakwin who is a member of the pediatric staff and who has ward and outpatient duties on the children s service similar to those of the other members of the staff At one time it was usual for members of the visiting staff to rotate through this clinic spending an afternoon a week for two or more years in the guidance clinic In this way the interest of the visiting staff in the psychologic aspects of pediatrics was roused and the gospel was spread I may say that at all times the number of cases which presented themselves for guidance has been at capacity The effort has always been made to use the guidance clinic as a consultation center and visiting staff members and interns have been urged to treat their own patients At the same time it was customary to present emotionally disturbed children at the clinical conferences, together with other cases of general pediatric interest All along the line we have been fortunate in having the benefit of consultation with Dr Lauretta Bender regarding intricate problems.

For the past fifteen years or so discussion of the psychologic aspects of pediatrics has been an essential part of ward rounds We have tried to pay attention to the emotional and motor needs of infants and children in the same way that we attend to their ailments and to their nutritional needs Nurses and interns are urged to pick up the babies and talk to them and play with them and give them the tender loving care without which they wither and die Unhappy whiny children get special attention Sometimes a particular child is assigned to an intern for his special attention It is not unusual for each of the interns to carry a baby during ward rounds. In some instances we invite the parents to hold and fondle their babies. In the case of unhappy children the parents are asked to bring them to the outpatient department for consultations.

These maneuvers may seem obvious to you They were not obvious to the pediatrician a few years ago Because of the danger of cross infections in wards for infants, it was the practice to isolate them and to manipulate them only when necessary

A few years ago a seminar on psychologic aspects of pediatrics was organized for the fourth-year students in the department of pediatrics. At these seminars the students gave brief presentations on such subjects as emotional development, training problems undesirable habits etc. and these subjects were then discussed by the group These informal discussions for about 15 students were very popular

During the past two years a weekly session for the students has been organized in the department of psychiatry A patient is selected from the pediatric outpatient department and presented by a student The case is then discussed by the students Dr Lauretta Bender, and myself Unfortunately each group of students has only four of these exercises

During the past year Dr Wortis has assigned a member of the psychiatric staff to the department of pediatrics She spends five half-days each week with us, and her services are widely sought.

The pediatrician is actively interested in the psychologic aspects of the child—perhaps because so many of us have problems in our own families. The pediatrician is ready to integrate psychologic care into his general program of child care I believe that in this respect he is more receptive than the internist.

I may be prejudiced but it seems to me that the most important concern of the psychiatrist today should be the emotional health of the child It seems reasonable to assume that difficulties are more easily handled in their inception than after they have become firmly entrenched in the personality of the individual I believe also that the most important concern of the pediatrician should be the emotional health of his patients. The program for the physical care of the child is well established In the success of this program, which has exceeded the expectations of the most optimistic, we have been greatly assisted by the improvement in the general economic level of the country However we have become aware that in centering our interest on the physical welfare of the child, we have neglected his mental health Indeed by rigid prescriptions and exact formulations, often based on inadequate information we have in many respects actually done harm

We need more men in pediatrics with the sort of training and interest which Dr Little has We need wider recognition in teaching institutions of the importance of this subject We need more help from the psychiatrists A program for training child psychiatrists must be worked out which is realistic It is not possible for any large number of men to be thoroughly grounded in pediatrics and in pediatric psychiatry and adult psychiatry as well The strange language of psychiatry the aloofness of the psychiatrist and the division into various schools and subschools of thought—something unique to modern medicine—are important factors retarding the assimilation of modern psychiatric thought into pediatric practice

for her baby, and, most important, the basic anxiety which a mother has as to whether she is really capable of being a mother in the full sense of the word—whether she is really capable of helping her child to grow up This latter problem is not one that mothers discuss much or even admit to themselves It is manifested by a variety of behavior patterns, such as too much care, generalized tenseness and anxiety, a forced lack of concern, or actual indifference If things go well, it may disappear, but, if there is colic, vomiting, restlessness, or other persistent disturbing symptoms on the part of the baby, it may increase the basic anxiety in the mother and lead to an exaggeration of her pattern of behavior In some situations it can go from bad to worse so that instead of the mother getting great joy and satisfaction from her baby she may have deep inside her a great resistance against this little creature who has so terribly upset her former even existence

This may be a slightly overdrawn picture, but there are all sorts of variations, and even if rejection does not take place, the mother can be made to feel so guilty because of her inadequacies that this guilt will prevent her from using her skill and intelligence in a natural, relaxed manner She becomes anxious, tense, and stiff and does things which, under ordinary circumstances, she would never think of doing

Babies are reasonably alert creatures, and if the mother is chronically upset, you seldom find a happy or relaxed baby The mother will be incapable of picking up her crying baby and holding him in such a fashion as to relax and soothe him She may be driven by her anxieties to all sorts of extremes and excesses such as ramming food down his throat or insisting rigidly on an early pattern of toilet behavior

This is no "pipe dream" Any of you who have had opportunities to follow mothers and babies through the first few years of life can vouch for the prevalence of such situations A great deal of this, I believe, is entirely preventable if the one person who accepts, welcomes, and, indeed, guides an entry into the family during these crucial months and years knows how to help This person is the pediatrician or the family doctor His role, if he choses to play it, is to make himself the kind of person with whom the mother will feel free to share her anxieties, without fear of ridicule, criticism, or indifference It is these qualities which the mother fears, often without cause, which prevents her from sharing her fears in their incipiency with someone who can really help If the physician is aware of what mothers are going through and how hard and embarrassing it is to share it with someone else, he can skillfully help that he really understands a real ally She then small difficulties at the sta she must spare the doctor troublesome enough to i time it is of such proport really is not interested I himself, because he does and wishes the mother ha

der girdle, chest axilla, or upper extremity in any or all areas This is often associated with numbness and tingling of the fingers and weakness of the grip The greatest intensity of pain is not necessarily referred to the arm or hand It may be in the paravertebral region in the area of the first and second dorsal level, the neck, the supra or infraclavicular region, or the axilla Not infrequently, there is associated occipital pain and tenderness There is often a sensation of weight or heaviness of the entire extremity This sensation may be so severe that the patient often states that it feels as though the arm is going to "drop off" The patient may complain of a cold hand

Paresthesias may affect the ulnar or radial portion of the arm and hand, or the entire hand may be involved Although numbness is a frequent complaint, anesthesia is not commonly demonstrable. In mild cases, there may be little or no pain, just a sensation of heaviness sometimes associated with paresthesia Elevation of the arm above the head may or may not give relief of pain Use of the arm which requires sustained elevation may cause severe pain. Examples are sweeping, shaving, or painting

There are several signs which suggest the presence of a scalene syndrome. These may be enumerated as follows

1 Fullness of the supraclavicular space

2 Tenseness of the scalene muscle only on the painful side

3 Reflexes may be diminished absent or normal

4 The grip is poor

5 Arterial amplitude and pressure changes take place with deep breathing and extension and rotation of the cervical spine

6 Reduced skin temperature of the hand may be present.

7 Forcing the head back and away from the painful side may cause increased pain

8 Rarely there may be increased skin temperature, causalgic areas on the dorsum of the lower arm and wrist prominent veins, and thickened fingers These signs are characteristic of pressure upon the subclavian vein

9 Compression of the anterior scalene muscle just above the clavicle causes intensified pain and distress as compared to pressure on the nonpainful side In this test, the thumb is placed about an inch above the clavicle forcing the posterior border of the sternocleidomastoid muscle medially Pressure is produced on the scalenus muscle of the nonpainful side Comparison on the painful side is then made In all cases the tenderness is much greater on the affected side, and the continued pressure intensifies the pain and distress

Although the maneuver eliciting the latter sign has been regarded as a good presumptive test it appears to be unreliable and may be compared to the straight leg raising test for sciatic pain It confirms the presence of pain along a certain pathway but does not give us a definite diagnosis The compression test will also give a positive response in cases of ruptured cervical disk osteoarthritis of the cervical spine or in other lesions which irritate components of the brachial plexus The pain is probably due to pressure or traction upon the nerves With a spastic scalene muscle this response can easily be mistaken for that of a primary scalene syndrome

I believe that inability to obtain relief in these cases by surgical intervention has mainly been caused by a failure to distinguish between the primary and secondary, or reflex types of anterior scalene syndrome.

A primary scalene syndrome is one in which symptoms originate and are due to an intrinsic disturbance of the anterior scalene muscle, spasm, hypertrophy, or myositis often due to trauma A secondary scalene syndrome may be defined as one in which symptoms are due to reflex spasm of the anterior scalene muscle caused by irritation of structures in the shoulder girdle or by disturbance of segments which innervate these structures It is extremely important that the two types be distinguished by clinical methods before attempting surgical procedures The primary type will obtain complete relief with procaine injection and surgery but the secondary or reflex type will obtain only partial relief Yet the signs and symptoms presented by each, may in certain instances be identical

Among the lesions which may cause reflex scalene spasm are intraspinal space taking and inflammatory lesions of the cervical spine radiculitis of the fourth to seventh cervical nerve roots malignancy of the cervical spine disease trauma or inflammation in or about the shoulder joint, and disease trauma, or inflammation of skeletal structures supplied by the fourth to seventh cervical segments including the central diaphragm and the pericardium Interesting phenomena are the reflex scalene syndromes which may follow coronary thrombosis

Several observers have mentioned the fact that a reflex scalene contracture may take place due to irritation of skeletal structures of the shoulder girdle or by irritation of nerves which supply these structures Such a secondary or reflex scalene syndrome causes a superimposed or overlapping pain picture upon the original lesion often masking the focus of pain In 1939 Bishop cited in detail one of 11 cases in which a calcified supraspinatus tendinitis caused a reflex scalene syndrome with typical symptoms including spasm and ten-

derness on pressure and changes in oscillometric readings with sensory and temperature changes [10] The swelling of the hand, pain in the arm, and sensory changes, as well as the fullness and tenderness in the region of the left scalenus anticus muscle, disappeared within a few hours after the operation and did not return

In many instances, the reflex contracture appears to cause signs and symptoms which are identical to those of a primary scalene syndrome There may be fullness of the supraclavicular space with a tense tender scalene muscle, and the grip is weakened Pain, numbness, and tingling of arm and hand may be typical, the patient may obtain relief by elevation of the arm There may be changes in arterial amplitude and manual compression of the lower end of the scalene muscle which causes intensified pain and distress At times, the pain from the reflex scalene contracture is of greater intensity than that of the original source of stimulus, so that, in spite of the fact that typical signs are present, we cannot be sure whether we are dealing with a primary or secondary syndrome in all patients If surgery is done at this point without further investigation, the patient may fail to obtain relief

At the present time, the most dependable method of differentiation appears to be the test originally introduced by Gage in 1939 [6] This consisted of an injection of the anterior scalene muscle using 5 cc of 1 per cent novocain, taking care not to infiltrate the phrenic nerve or brachial plexus and waiting five to ten minutes for relief of pain Others have used as much as 10 cc After applying this method for a period of time, anesthesia of the sympathetics as well as partial anesthetization of the brachial plexus were not infrequently encountered, thus nullifying the test In order to lessen the incidence of brachial plexus and sympathetic anesthesia following the injection, the technic was modified Instead of 5 cc of the 1 per cent novacaine, $1^1/_2$ to 2 cc was injected, and we attempted to localize the muscle infiltration more accurately A $^3/_8$- to $^1/_2$-inch needle is used to prevent too great a depth of injection The time element is reduced to three minutes It is possible in most instances, by forcing the clavicular insertion of the sternocleidomastoid medially, to isolate the lower portion of the scalene anticus muscle between two fingers so that it can be directly infiltrated The technic of this procedure is as follows

The patient's head is brought to the painful side to relax the sternocleidomastoid muscle The clavicular insertion of the sternocleidomastoid muscle is pushed medially, at the same time forcing the fingers inward and downward The patient is instructed to take a deep breath and hold it As inspiration takes place, the scalene muscle can be felt to tighten The muscle is straddled by two fingers and, at the same time, the head is tilted toward the opposite side and slightly retracted The fingers are forced inward on either side of the muscle, so that the pressure causes the muscle to bulge forward A $^3/_8$- to $^1/_2$-inch needle is inserted between the fingers directly into the belly of the muscle, and $1^1/_2$ to 2 cc of 2 per cent procaine are injected In patients with short, heavy necks or with a tight sternocleidomastoid muscle, it is not always easy to separate the anterior scalene muscle so that it can be accurately infiltrated It may be necessary to inject these cases on more than one occasion in order to satisfy oneself that a satisfactory infiltration has been made

In primary cases, the response is rapid and dramatic The patient loses the heavy sensation, the pain disappears, the tingling stops, and the grip is restored to normal—all within a matter of minutes

It is the immediate effect following injection which determines whether or not a primary syndrome is present If the pain disappears completely within a three-minute period without signs of sympathetic or brachial plexus anesthesia, a primary syndrome may be suspected The more rapidly pain disappears, the more likely it is that a primary condition exists In addition to this, it is important that a re-examination be made the moment the patient states that the pain is relieved Deep pressure or percussion over the cervical spinous processes with a hard rubber hammer often elicits acute tenderness in the lower cervical spine If the patient has considerable relief of the pain following the injection and these tender points are found, or if pain develops on flexion, extension, or rotation of the spine during the relief period, one should be suspicious of a lesion in the lower cervical spine and not conclude that the condition is one of a primary scalene syndrome It is better to wait and note the effect of a series of infiltrations and observe whether or not pain completely disappears following each infiltration or whether it disappears to a certain degree Rotation of the neck is not sharply limited by a painful catch to either side when a primary scalene syndrome is present This is usually due to other pathology in or around the cervical vertebra A scalene syndrome does not cause stiffness of the cervical spine Painful or limited motion of the shoulder joint is not caused by a primary scalene syndrome

Although Gage first suggested a differential diagnostic injection in 1939, Kaplan, in 1941, was the first to recommend repeated procaine infiltration as a form of therapy [6 11] The best conservative treatment of a primary scalene syndrome is repeated procaine infiltration Postural correction

and physical therapy are of additional value If after four treatments, sustained relief is not obtained, the muscle should be transected If progress is made, injections may be continued If progress becomes stationary, the amount of residual pain should be the guide for surgery Over 80 per cent of patients will obtain clinical relief of pain by repeated infiltration These figures are in accord with Hansson who states that only 15 to 20 per cent require surgery [12] His patients were treated by postural correction and physical therapy

In a secondary scalene syndrome, the muscle should not be sectioned. Infiltration of the muscle will give only partial relief Search must be made for the underlying lesion X ray studies should be made of the cervical spine, upper dorsal spine, scapula, chest, and shoulder joint.

There is no doubt that in certain patients the differential procaine test may fail to give the desired information. In these instances the failure could be due to anatomic variations For example, pain has been reported due to compression of a nerve root by a scalenus minimus muscle. In another patient the lateral edge of the cervical fascia became thickened and hardened and compressed the third portion of the subclavian artery, and the patient obtained no relief until this fascia was released. Anomalies of the first rib have been reported as causing compression and irritation. It is conceivable that edema due to compression, involving either the nerves or other structures which might produce pain, could not subside in the short time required to produce the anesthesia and release of the anterior scalene muscle However, all of these variations do not appear to be common, since in most instances of what appeared to be anterior scalene syndrome we were able to obtain immediate relief of the symptoms This relief, of course, does not always apply to those cases in which there is direct compression, such as a cervical rib or where there is vascular compression due to narrowing of the costoclavicular space. The rapidity and degree of relief depends on factors causing the compression and on the rigidity and fixation of the structures involved In one instance, a patient obtained complete relief following infiltration of the anterior scalene muscle, and we would have presumed that this was an anterior scalene syndrome had we not felt a nodule behind the muscle which proved to be a metastatic lesion due to a primary growth in the lung Unless signs of vascular compression or changes in arterial amplitude are marked, they do not appear to be of positive value. These changes appear to be of more value if found in the rest position In many instances one can produce a decrease in the pulse volume in patients who do not suffer pain by applying the various maneuvers which are supposed to be diagnostic of the scalenus anticus syndrome Those cases in which anatomic variations have produced the symptoms which cannot be released by a scalene infiltration cannot be accurately diagnosed until these structures have been exposed and the points of compression observed Surgery of this type is of course, exploratory One cannot therefore be sure at all times that a scalenus anticus syndrome does exist, except in those forms where it is actually due to spasm which is released by anesthesia

Simulation of Anterior Scalene Syndrome

Narrowing of the costoclavicular space which compresses the subclavian vessels produces symptoms identical to those of a scalene syndrome Injection of the muscle gives no relief Resection of the portion of the first rib underlying the subclavian vessels may be necessary to effect a cure

Pain in the elbow region due to an external epicondylitis and extensor tendinitis is often associated with subjective numbness and tingling in the fingers The epicondyle is tender to pressure and rolling the tendons under the examining finger often causes reflex paresthesia to the hand This pain may be aggravated by asking the patient to grasp a large object with all the fingertips and squeeze hard This causes pain in the elbow region and extensor tendons below Infiltration of the acute tender points at and below the epicondyle with 3 to 5 cc. of 2 per cent procaine often causes disappearance of pain and paresthesia depending upon the accuracy of infiltration

Pain in the shoulder girdle and lower arm is often due to reflex radiation which has its origin in the infraspinatus fossa The trigger point is about 3 5 cm. below the midspine of the scapula. Pressure and rolling with the finger often reproduces and intensifies the painful radiation to the shoulder and arm. This point should not be labeled as a fibrositic deposit, as it is constant in its location. We believe that it is the branch of the suprascapular nerve which supplies the infraspinatus muscle—a Valleux point. This point is located and infiltrated with procaine by passing the needle down until contact is made with the scapula Three cubic centimeters are injected The needle is withdrawn slightly, and another 3 to 5 cc. are injected This syndrome may exist alone or is found in conjunction with other shoulder lesions

Brachialgia statica paresthetica is a condition due to a mechanical irritation of the lower cord of the brachial plexus which causes numbness and tingling in one or both hands. There is usually no pain This syndrome may simulate a scalene syndrome. Any pathology which causes inflammation or compression of the subclavian vessels or the brachial plexus or any lesions of the shoul-

der girdle, including the cervical and upper dorsal spine, may produce pain simulating an anterior scalene syndrome

None of the preceding conditions which simulate an anterior scalene syndrome are relieved by a diagnostic infiltration of the muscle

The mere fact that an examination is made in search of a scalene syndrome makes us aware of segments and structures which may be directly or reflexly involved In reflex syndromes, the diagnostic injection is of great value because it erases the overlap of the scalene picture and allows better localization of the original point of stimulation In certain instances where two lesions exist, one overlapping the other, it is impossible to arrive at a correct diagnosis without use of this procedure

Summary

It is not the purpose of this paper to imply that an accurate diagnosis of scalenus anticus syndrome cannot be made without the use of a diagnostic injection However, I believe that the use of this technic will prevent a considerable percentage of failures in diagnosis and surgery and will give us one more effective means of therapy

REAWAKENING OF CHRISTIAN FAITH NEEDED

To combat the insidious encroachment of Godless and destructive ideologies into our land, there must be a reawakening of Christian faith A people without belief in a Supreme Being cannot long endure Marx in *Das Kapital* wrote, "The democratic concept of man is false because it is Christian The democratic concept holds that each man is a sovereign being This is the illusion, dream and postulate of Christianity" Over 250 years ago William Penn said "Those people who are not governed by God will be ruled by Tyrants"

The preservation of freedom in our country is everybody's job It is not unusual to hear physicians say, "Well, what can I do?" There is no distinction between John Smith, M D, and John Smith, citizen The unfortunate tendency of members of our profession to become self-centered, isolating themselves from community activities, has deprived their neighbors of wise counsel and allowed do-gooders and social reformers to carry on programs which, distasteful to our profession, are mere steppingstones to a complete surrender to foreign ideologies ultimately resulting in destruction of freedom

It requires more than lip service Great demands will be made upon your time and energy Is it worth it? If you believe that you can influence and help your fellow Americans in the field of education, government, labor-management, newspapers, books, and radio, and strengthen those principles which we, as Americans, hold dear and which mean so much to you now, and which should guide your children in a happy, prosperous and God-loving world in the future, it is your privilege and duty to act now Should you be lax in your duty or indifferent to the challenge, it might be well to recall the words of President William McKinley when he said "Our strength rests in our patriotism Peace and order and security and liberty are safe so long as love of country burns in the hearts of the people Liberty, my fellow citizens, is responsibility, and responsibility is duty, and that duty is to preserve the exceptional liberty we enjoy within the law and for the law and by the law"—

From an address by Dr Joseph H Howard, Bridgeport, Connecticut, at the Annual Conference of State Society Presidents, Chicago, June 20, 1948

ELECTRONARCOSIS IN PSYCHIATRIC THERAPY

BERNARD L PACELLA M D New York City

(From the New York State Psychiatric Institute and the Westhill Sanitarium)

SINCE the introduction by Cerletti and Bini in 1938 of the electrical method of producing therapeutic convulsions in psychiatric patients, a number of variations of the electrical characteristics of the stimulating current have been developed and employed in clinical practice [1] The reasons for the attempts to alter the electrical characteristics of the current used in shock treatment may be briefly summarized as follows (1) to increase the therapeutic effect of electric shock treatment, (2) to employ the least amount of electrical energy which would be compatible with the maximum therapeutic effect (3) to produce the least amount of cerebral pathologic change and fewest undesirable complications, and (4) to minimize confusion and memory disturbance in the patient

Changes in the electrical characteristics of any stimulating current may involve changes or variations in the following

1 The wave form, e g , rectangular waves, variations of the sine wave, and spike pulses
2 The duration of the individual wave or pulse
3 The frequency (rate of occurrence per second) of the waves or pulses
4 The peak voltage of the waves or pulses ("amplitudes")
5 The use of unidirectional waves or pulses (rectification of alternating current)
6 Combinations in differing degrees of the above variations.
7 Variations in the total time of application of the applied stimulus with usually corresponding inverse variations in the strength of the current applied.

It is obvious that many varieties of alterations of electrical characteristics can be employed The Cerletti-Bini technic is the original form of electrical stimulus and utilizes unmodified sine wave current alternating at a rate of 50 or 60 cycles per second, which is the common type of A C house current. Most of the shock treatment units still in clinical usage and still being manufactured employ this type of current. There are two general types of apparatus constructed to deliver this current, one which applies a predetermined voltage to the head and one which delivers a predetermined current which remains constant over large changes in electrical resistance of the head

Most apparatus is constructed so that a predetermined voltage is applied to the head between bitemporal or vertex temporal electrodes The voltage generally may be any value from 90 to 130 volts, while the duration of stimulus varies from one-tenth to four tenths second The current traveling between the electrodes applied to the head has generally varied from 300 to 1,000 milliamperes and is not a constant value. This is the type of stimulating current that Cerletti and Bini employed

Apparatus which employs a predetermined constant current as the stimulating current to produce the usual convulsive treatment is a somewhat later development wherein the current is maintained at a constant level during the treatment over a reasonably wide range of impedance changes in the tissues between the electrodes These usually deliver a lower current (up to a maximum of 300 milliamperes) than the fixed voltage apparatus Because of the lower current, which can be regulated a more prolonged time factor is utilized, varying from five-tenths to five seconds, for the production of the ordinary convulsive treatment.

Electronarcosis therapy involves a considerably longer application of a predetermined constant current of the sine wave type for a minimum total period of four minutes. This method of treatment was developed chiefly by Tietz *et al* in California in 1945 and 1946 although considerable experimental work with electrical narcosis in animals had been conducted since the early 1930 s by Van Harreveld, Wiersma and associated investigators.[2–7] An initial current varying from 160 to 200 milliamperes (which is considerably lower than that employed in ordinary electric shock therapy) is applied by bitemporal electrodes for the first ten to thirty seconds during which time the patient remains in a tonic spasm The upper limbs are usually in tonic flexion and the lower limbs in extensor spasm The patient is usually apneic Initially there is a short cardiac arrest after which the heart beats slowly and often irregularly At the end of ten to thirty seconds the current is dropped to between 50 to 75 milliamperes at which time a short clonic phase ensues. Respirations begin in from several seconds to thirty seconds after the end of the clonic phase, and as soon as respiration is well established, the current is slowly increased again to a maximum of about 125 milliamperes

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Neurology and Psychiatry May 21 1945.

The patient frequently develops respiratory stridor with increase in current, in addition to occasional motor restlessness In many instances, the maximum current of 125 milliamperes cannot be obtained because of the marked stridor or respiratory arrest of the patient, and, therefore, a lower current will be maintained to prolong the unconscious state of the patient

It might appear that the term electronarcosis is a misnomer since the patient actually is subjected to a modified form of convulsive seizure at the onset of treatment The difference between this seizure and those obtained by the use of the Cerletti-Bini technic is that the present one consists primarily of a long tonic phase of ten to thirty seconds' duration followed by a very short clonic reaction The subsequent long period of unconsciousness is a "subconvulsive" tonic reaction rather than a true narcotic state of the patient

More recently, Tietz introduced the "Glissando" technic for the application of this stimulating current, instead of applying the peak current initially, there is a gradual rise from zero to the peak value over a period of one second, and then the peak value is maintained for the desired length of time (ten to thirty seconds) This gradual but rapid increase of current tends further to minimize the severity of the initial muscular contraction and arching of the spine and thereby lessens the possibility of fracture

Almost a year ago, we instituted electronarcosis therapy at the New York State Psychiatric Institute and the Westhill Sanitarium, where the great majority of patients have been treated The work at the Psychiatric Institute was conducted in collaboration with Drs Horwitz and Kalinowsky, but since the material studied thus far at the Institute has been so small, the present report is based almost entirely on cases treated at the Westhill Sanitarium Most of these patients had been subjected to previous courses of electric convulsive therapy and/or insulin coma therapy without effect or with temporary effect

There is a total of 45 patients, 12 of whom are men and 33 women Thirty-nine of this group were diagnosed as dementia precox, three as manic depressive psychosis, and three as involutional psychosis Of the 39 schizophrenic cases, nine were classified as being the paranoid type, six the chronic catatonic type, and 24 hebephrenic The number of treatments administered to each patient varied from a minimum of six to a maximum of 32 The total number of treatments administered to this group was 575 with an individual average of 13 treatments The degrees of response to therapy may be roughly divided into four main categories grade A, complete remission of symptoms, grade B, considerable remission of symptoms with satisfactory social adjustment but persistence of some of the psychotic ideation and affect, grade C, partial remission of symptoms with partial improvement in social behavior (mild to moderate improvement), and grade D, no improvement

All of the manic depressives and involutional melancholias exhibited grade A improvement None of these patients showed any relapse during a period of two months following treatment

In the schizophrenic group all paranoid and all catatonic patients exhibited B or C improvement at some time during or immediately after treatment This improvement, however, was only temporary in six of the nine paranoid patients and in four of the six catatonic cases, they exhibited return of symptoms within a period of one month after termination of treatment Of the 24 hebephrenic cases, 19 were substantially or moderately improved (grades B and C), while five of the patients were essentially unchanged However, 13 of the 19 improved patients showed relapse, while the remaining six cases maintained their initial improvement Thus, in the combined dementia precox group, 11 of 39 patients, or 28 per cent, were substantially improved and maintained this improvement for a period of at least one month following treatment

However, these statistics alone may be somewhat misleading without further qualifying the types of patients with which we were dealing They included, to a large extent, those patients who had been ill for a considerable period of time and who also had been subjected to other forms of shock treatment, such as the ordinary type of electric shock and insulin coma therapy Seven of the patients had been ill for over ten years, and the remainder of the group, with three exceptions, had been ill for periods exceeding one year It is noteworthy that all of the cases which responded to treatment and maintained this beneficial response were ill for less than five years, seven of the 11 patients had been ill for less than two years The time duration of the illness, therefore, is of considerable importance in obtaining a good result Generally, symptoms were considerably improved after three or four electronarcosis treatments, and only six to nine treatments were required for the depressive disorders

A larger number of treatments had to be given to the schizophrenic patients, the hebephrenic group receiving the greatest average number per patient

A very striking observation noted in the schizophrenic patients was the remarkable improvement which some appeared capable of showing, even when the illness was of long duration and it

was possible that the patient might soon relapse into psychotic behavior when "sustaining" treatments were not given In one case a woman, aged twenty-six, who had been ill for about ten years and diagnosed as dementia precox of the hebephrenic variety, played an excellent game of tennis for the first time since the onset of her illness after she received three electronarcosis treatments However, one week after termination of her course of therapy (20 treatments), she relapsed

No serious complications such as fractures were observed in our series of patients, although routine post treatment x rays were not taken Other complications, such as post treatment confusion and memory loss, were somewhat less pronounced than with the usual electric shock treatments

As regards the comparative therapeutic value of electronarcosis with electric shock therapy, it appears to have definite superiority over the latter in schizophrenic psychoses and is certainly equally effective in the affective disorders. However in the latter cases which respond so well to electric shock therapy, there is no need for electro-narcosis *With respect to insulin therapy*, it is our impression that in certain instances electronarcosis has been definitely superior The superiority has not consisted so much in the occurrence of permanent improvements, when these patients had not been permanently improved from previously administered insulin therapy but rather in the greater degree of improvement which these patients showed, as contrasted with their responses to insulin In these cases, after the initial course of electronarcosis was given, sustaining treatment at the rate of about one treatment per week was administered to maintain improvement thus cannot be done with insulin coma therapy

Although we should not be too hasty to substitute electronarcosis in place of insulin therapy without extensive clinical trial it represents a significant step forward in the therapy of schizophrenic patients, especially of the paranoid type who have been refractory to other forms of shock therapy

If electronarcosis treatment is proved to be equally as effective as insulin coma treatment which Tietz and her co workers claim, it would be of *considerable importance* *Insulin treatment is a* lengthy treatment, requires a relatively large force of trained personnel, and the number of patients who can be treated is greatly limited by the shortage of bed space in the State hospitals and sanitariums The electronarcosis treatment is a controlled treatment i e under the control of the physician at all times, and can be terminated immediately without difficulties, it appears to be associated with less risk and fewer complications than insulin treatment

Certainly, regardless of the future outcome of electronarcosis treatment at the present time it *provides new avenues for study and research into* the treatment of the psychoses

MENINGITIS LOSING ITS STING ARMY REPORTS

Spinal meningitis, terror of World War I training camps, has today lost much of its menace according to a report by Dr Worth B Daniels submitted through the Office of The Surgeon General of the Army in the *Archives of Internal Medicine*

The report points out that less than three per cent died of some 14,500 soldiers treated during the World War II period for this once almost hopeless infection The remarkably low death rate was due Dr Daniels said, both to the efficacy of sulfadiazine and penicillin in controlling the infection and to quicker diagnosis Early diagnosis and the prompt use of the drugs can usually stop the spread of the bacteria before they have a chance to become localized in the linings of spinal cord and brain.

Altogether there were about 300 deaths from meningococcic infection in World War II Approximately ten per cent of these died before the germ had become localized in the nervous system tissues

The war experience *Dr Daniels says, shows that* sulfadiazine is the best available drug It is not so effective as penicillin against the bacteria in the blood stream but the latter drug proved to have one great disadvantage

While penicillin circulates through the blood stream freely it does not get into the cerebrospinal fluid in predictable quantities and hence cannot be relied upon to prevent invasion of brain and spinal cord tissues. Sulfadiazine enters the spinal fluid rapidly in high concentrations

AN EVALUATION OF HYDRYLLIN (DIPHENHYDRAMINE AND AMINOPHYLLIN) IN THE SYMPTOMATIC TREATMENT OF ALLERGY

HARRY MARKOW, M D , SAMUEL BLOOM, M D , and HARRY LEIBOWITZ, M D , Brooklyn, New York

(From the Department of Medicine, Division of Applied Immunology, Beth-El Hospital)

THE antihistamine drugs have proved of decided value in the treatment of various allergic disorders It is generally agreed by various investigators that the most satisfactory therapeutic effects have been noted in the treatment of hay fever and urticaria, successful results having been reported as high as 85 per cent in some instances [1 2] The most popular drugs in use have been benadryl (diphenhydramine hydrochloride) and pyribenzamine (tripellenamine), and the results did not vary greatly whether one product or the other was used So great has been the popularity of these chemical agents that many patients discarded specific therapy and relied entirely upon the use of these drugs, sometimes with disastrous results

In other forms of allergic disease these drugs have generally proved to be disappointing, although there were some early reports of success in bronchial asthma, with figures running as high as 60 to 75 per cent good results [3–5] Later investigators did not substantiate these early findings Feinberg obtained relief in 12 per cent of 50 cases of asthma treated with benadryl and in 28 per cent of 121 cases treated with pyribenzamine [6] Schwartz and Levin reported good results in eight out of 20 cases of asthma (40 per cent) treated with benadryl, and Lockey in 33 per cent of 21 cases of intractable asthma treated with the same drug [2 7] Koelsche, Prickman, and Carryer also reported benefit in only four out of 12 cases, or 33 per cent, of bronchial asthma treated with benadryl [8] The results of therapy with benadryl were also disappointing to Todd, who noted the poor results obtained with this drug in the treatment of bronchial asthma [9] It is possible of course, that the mechanism involved in the asthmatic attack is not the release of histamine, and hence the failure of antihistaminic therapy

Some of the failures in the use of the antihistaminic drugs may have been due to the high degree of side reactions occurring during the course of the therapy This very often necessitated the discontinuance of the drug before a satisfactory trial could have been made These reactions were mild in some patients but so intense in others that the drug was discontinued after the first dose Other patients were able to tolerate the drug only after persisting in its use, so that early side reactions [illegible] for discontinuance of the therapy Among the common side reactions noted were drowsiness, lassitude dizziness, nervousness, insomnia, dryness of the mouth, nose, and throat, headache, palpitation, dysuria, nausea, vomiting, diarrhea, and, at times, the induction of an attack of bronchial asthma The incidence of these reactions has varied from 17 to 29 per cent with pyribenzamine [10 11] With benadryl, toxic symptoms have been reported in 50 to 60 per cent of the patients taking the drug [2 6]

Hydryllin, produced in tablet form, is a combination of 25 mg of diphenhydramine base and 100 mg of aminophyllin * The rationale of this combination has been questioned in the report of the Committee on Therapy of the American Academy of Allergy, since the drug is a combination of two already known preparations, and it is understood that these drugs can be prescribed individually [12] The combination of these two drugs should theoretically be beneficial in the treatment of bronchial asthma because of the well-known therapeutic effect of aminophyllin and the antihistaminic effect of diphenhydramine (benadryl) Furthermore, the stimulating effect of aminophyllin on the central nervous system might counteract the depressant effects of benadryl, diminishing or avoiding toxic reactions [13]

It is the purpose of this paper to report on the use of Hydryllin in a group of 81 cases of allergy, including 46 cases of bronchial asthma At the onset it was decided that the initial dose would be one tablet to be taken at night, and subsequently the dose was to be increased to as many as six tablets daily, depending upon the therapeutic effects or toxic symptoms encountered In some cases even one tablet could not be tolerated, in others, by pushing the dose, the patient could tolerate three to six tablets daily, and, finally, in another group, beneficial results, obtained by having pushed the dose to six tablets daily, were maintained on a reduced dosage of one tablet daily for a period of time

From Table 1 it can be seen that in a group of hay fever cases, 14, or 52 per cent, obtained definite relief (50 to 100 per cent amelioration of symptoms) with Hydryllin In some cases relief followed immediately after the first use of

* Hydryllin tablets were generously supplied by G D

* Relief (nasal symptoms only)

the drug but in other cases it was necessary to increase the dose to three to six tablets daily In 45 per cent of the cases there was either no relief or only slight relief of symptoms and in one case the patient was actually worse with the development of a severe headache necessitating the discontinuance of the drug These results in the treatment of hay fever are not so satisfactory as those reported with other antihistaminic drugs

In eight cases of hay fever complicated by pollen asthma, five or 62 5 per cent experienced good results. In one case hay fever symptoms were relieved with no apparent therapeutic effect on asthmatic symptoms while in another case asthma was greatly relieved but with no effect on hay fever symptoms.

In six cases of perennial allergic rhinitis the results were disappointing since in only one case was there any relief experienced from the administration of Hydryllin In two cases of perennial allergic rhinitis complicated by perennial bronchial asthma the effect of Hydryllin was excellent on the asthmatic symptoms, but the nasal symptoms were not relieved at all

While in this group there are not a sufficient number of cases of urticaria and allergic bronchitis worthy of discussion, the results in our two cases were poor In fact, in the case of allergic bronchitis the symptoms were fairly well controlled by the administration of 50 mg of pyrilbenzamine three times daily

However, in the group of 36 asthmatics and ten asthmatics complicated by or complicating nasal allergy the results were decidedly better than have been experienced to date with other antihistaminic drugs It is acknowledged that recent reports in the literature have failed to confirm the earlier reports of the beneficial effects of antihistaminic drugs in the treatment of bronchial asthma The latest figure claimed for pyribenzamine is 26 per cent of cases of bronchial asthma alleviated [14] Of our group of 36 patients with perennial asthma, 25 or 69 per cent, were definitely improved either during the acute phase of the asthmatic attack or when the drug was taken daily as a preventative It is true that new drugs often prove beneficial to asthmatics The continued use of a drug with beneficial results cannot be ignored In some of these cases three to six tablets daily were necessary for relief of symptoms yet one tablet daily maintained this relief for as long as five months

In eight cases of asthma with seasonal hay fever five or 62 5 per cent, were relieved as noted earlier in this paper In the two cases of asthma with perennial allergic rhinitis both were relieved of asthmatic symptoms without any effect on the nasal symptoms Adding these ten cases to our 36 cases of uncomplicated asthma we find that, out of a total of 46 cases of asthma 32 or 70 per cent, were definitely benefited by the administration of Hydryllin These results in the use of Hydryllin in bronchial asthma have been striking and somewhat surprising since many of our patients have received either benadryl or aminophyllin previously without such beneficial results

Toxic Symptoms

Of the 81 patients in this group 30, or 37 per cent, experienced 71 toxic reactions of varying severity In 13 or 16 per cent, the symptoms were slight and were ignored In five or 6 per cent, the symptoms were moderate, but the drug was continued In 12, or 15 per cent of the group severe reactions requiring the discontinuance of the drug occurred after the first dose or after the administration of several doses In some cases, reactions to one tablet three times a day were overcome and tolerance established by pushing the dose to six tablets daily In a few reactions after the first few doses disappeared with persistence of the therapy As a rule when the toxic symptoms were severe, the patient did not wait for instructions to discontinue the drug The type of reaction encountered and the frequency of occurrence are indicated in Table 2

TABLE 2.—INCIDENCE OF THE OCCURRENCE OF TOXIC SYMPTOMS

Toxic Symptom	Occurrence (All Degrees)	Occurrence (Severe)

SPAN IN U S NEARS 67 YEARS

average life's span of people in the United has climbed to a new mark of almost 67 years, ated on the basis of 1946 death rates, the Fed- ecurity Agency reported recently

new longevity figure represented an increase rly a full year over the average length of life ated for 1945 and a gain of almost two years he level prevailing in the immediate prewar of 1939 to 1941

agency's calculations, based on life tables for ompiled by the FSA's national office of vital ics, Public Health Service, showed also that pectation of life at birth for white females was) 3 years

increase marked the first time in the history s country that the biblical "three-score-and- years had been exceeded Life's expectancy creased steadily since the turn of the century, r as a result of control of infectious diseases formerly exacted a heavy mortality toll infants

tables showed that the average life expectancy ite males at birth was now 65 1 years

The average longevity for nonwhites, on the basis of 1946 figures, was 61 years for females and 57 5 for males, but the improvement between 1945 and 1946 was greater for nonwhites than for the white segment of the population In fact the agency noted a narrowing race differential in longevity since 1900

On the basis of 1945 life tables, the life expectancy of a newborn white female baby had been 69 5 years, compared with the newly issued figure of 70 3 years

A male white baby, who could now expect to live 65 years, could, on the basis of the earlier statistics, have looked forward to slightly less than 64 5 years

Among the nonwhites, a female baby's life expectancy had increased, on the basis of the 1946 figures, to 61 years, whereas the computations of the year before had indicated that 59 6 years lay ahead

A male nonwhite baby can count, on the average, on a span of 57 5 years, on the basis of the 1946 tables, a year earlier the statistics indicated that his term would cover 56 1 years

There was several years' discrepancy between the life expectancy of white babies and nonwhite babies

THE MANAGEMENT OF ANURIA IN ACUTE MERCURIAL INTOXICATION

ALFRED P FISHMAN M D IRVING G KROOP, M D H EVANS LETTER, M D , and ABRAHAM HYMAN M D New York City

(From the Medical and Genitourinary Services Mount Sinai Hospital)

IN FEBRUARY, 1947, a Kolff "artificial kidney" was acquired by the Mount Sinai Hospital through the courtesy of Dr W J Kolff, Kampen, Holland and Dr A Hyman, New York. Since then, patients with existing or impending uremia have been referred as potential subjects for its use In each instance the oliguria or anuria was ascribed to reparable renal disease, usually of the "lower nephron nephrosis" type, where kidney damage is reversible and ultimate restitution of kidney function can be anticipated [1] Prior to admission to this hospital, each patient had received various types of treatment, but the prime purpose in all instances appeared to be directed at increasing the urinary output by administering large volumes of fluids intravenously

It was only when this medical management had failed to increase the urinary volume that the patients were referred for the possible use of the artificial kidney At this hospital a period of observation and study was instituted to determine whether the patient was to be subjected to the artificial kidney [2] It soon became evident to us that the conservative measures introduced in our preliminary period of study and observation could be continued to allow spontaneous resolution of the anuria A series of these cases will be published at a future date. It is the purpose of this paper to present as a prototype a patient with acute mercurial intoxication sent to us for dialysis by the artificial kidney who recovered without the benefit of mechanical intervention. This case is presented to emphasize the dangers of overtreatment, to indicate the possibilities of spontaneous resolution of acute toxic anuria, and to urge caution in evaluating the efficacy of the various mechanical methods currently advocated for the relief of acute anuria.

Case Report

Case 1—M W a 52-year-old white man was transferred to the Mount Sinai Hospital on May 1 1947 thirty-six hours after the ingestion of seven tablets (3 5 Gm.) of mercuric chloride in attempted suicide. Vomiting had started approximately twenty minutes after the tablets were swallowed but no tablets were identified in the vomitus Diarrhea had started approximately one-half hour after vomiting, it persisted for about eighteen hours then stopped abruptly The patient was admitted to another hospital two hours after the tablets were swallowed and emergency measures were instituted Gastric lavage was employed using tap water and protein-containing fluids and several colonic irrigations were done. Saline and glucose solutions were administered intravenously to combat shock A few cubic centimeters of bloody fluid were voided shortly after hospitalization but for the twenty-eight hours prior to transfer to this hospital no urine had been passed or obtained by catheter and the nonprotein nitrogen of the blood rose to 78 mg per cent The previous personal history family history, and habits were noncontributory There was no history of previous renal disease

Physical Examination—The patient was a well-developed, well-nourished and cooperative white man lying quietly in bed. His complexion was sallow The skin and mucous membranes appeared pale. Slight periorbital edema was present The tongue was dry The heart and lungs were normal The blood pressure in millimeters of mercury was 140/70 The abdomen was not distended or tender

Laboratory Findings—On admission a blood count showed the following red blood cells 3 100 000 per cu mm., hemoglobin 63 per cent (Sahli) and white blood cells 18 800 per cu mm with 72 segmented polymorphonuclear leukocytes 9 nonsegmented 14 lymphocytes 1 monocyte 3 eosinophils and 1 basophil Catheterization of the bladder failed to yield any urine Two cubic centimeters of urine which were obtained on the second day contained epithelial debris many white blood cells, 5 or 6 red blood cells, and 1 plus albumin Subsequent findings are indicated on Fig 1 The blood urea nitrogen on admission was 49 mg per cent and the carbon dioxide content of the blood was 31.2 volumes per cent

Course—The patient's physical and mental state deteriorated slowly with gradually progressing restlessness and confusion to the time of diuresis on May 8 1947 A moderately severe stomatitis was noted on May 2 and responded slowly to local treatment. Sacral edema and a few fine moist rales appeared on May 4 (sixth day of anuria) and persisted until a day after the diuresis. Diarrhea started on May 7 and lasted for three days. The blood pressure rose to 150/90 from May 4 to 6 but then returned to normal.

The course of the patient in relation to treatment is indicated in Fig 1 On the second hospital day fluids were restricted to less than 1 000 cc. nearly all of which was administered by mouth Small transfusions of whole blood were used to combat the anemia A protein-free, salt free 1,500 to 2 500 calorie diet was given Sodium chloride and sodium bicarbonate were administered in accord with fluctu

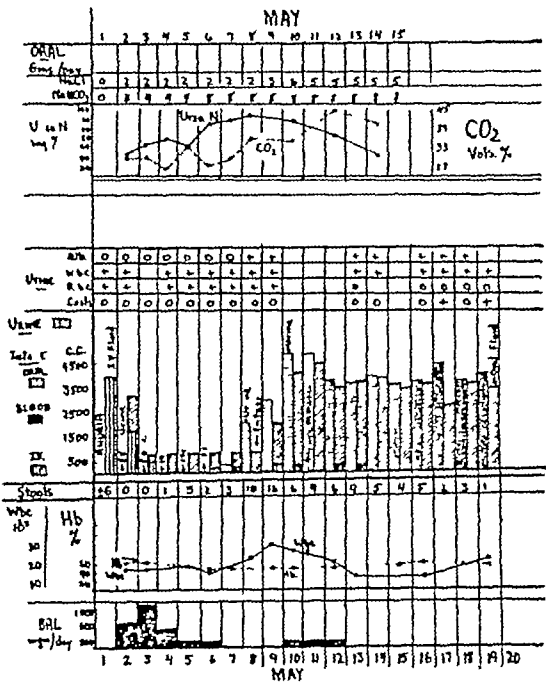

FIG 1 Anuria due to ingestion of 2 5 Gm. of bichloride of mercury Note the onset of diuresis on the eighth day

ations in the carbon dioxide and chloride content of the blood A course of 2-3 dimercaptopropanol (BAL) (3,000 mg in five days) was given, starting the day after admission, and repeated (540 mg in three days) with the recurrence of the diarrhea Toxic effects occurred after each injection and consisted of salivation, flushing, abdominal cramps, and nausea. On May 6 the patient voided 23 5 cc On May 7 the urinary output rose to 319 cc On May 8, the ninth day following onset of anuria, the urinary excretion reached 2,094 cc At this time, fluids by mouth were increased to correspond with the urinary output, and sodium chloride was given to replace the loss as a result of the diuresis The edema started to diminish the day after diuresis The patient's general condition improved markedly thereafter, and the patient was discharged on the twentieth day after admission, fully ambulatory and without complaints

The blood urea nitrogen rose to a maximum of 120 mg per cent on May 8 and fell slowly following the onset of diuresis The blood carbon dioxide content ranged from 28 1 volumes per cent on May 7 to 45 1 volumes per cent on May 12 Hematocrit values were 28 per cent on May 6, 26 per cent on May 9, and 31 per cent on May 14 The hemoglobin percentages on these days were 51, 48, and 55, respectively (Sahli) The blood serum chloride values (as sodium chloride) ranged from 527 mg per cent on May 3 to 630 mg per cent on May 10 The total proteins of the blood on May 3 were 4 4 Gm per cent, the blood serum sodium values were 134 milliequivalents per L on May 3 and 140 5 milliequivalents per L on May 5, 6 7 milliequivalents per L on May 9, and 6 3 milliequivalents per L on May 10

The blood calcium value on May 3 was 11 0 mg per cent, and the phosphorus was 3 0 mg per cent The stools remained guaiac positive until the seventeenth hospital day The urine continued to show albumin, white blood cells, red blood cells, and epithelial debris, but no casts were identified until shortly before discharge The specific gravity of the urine remained low, varying from 1 010 to 1 013 at the time of discharge

Follow-up —The patient returned for re-examination and laboratory studies on November 5, 1947 He had no complaints and had resumed full activity General physical examination was normal He was able to concentrate his urine to 1 024 after an overnight thirst The blood urea nitrogen was 14 mg per cent The phenolsulfonphthalein test revealed that 85 per cent of the dye was eliminated in two hours The urine was normal, acid, with no sugar, no albumin, and no formed elements on microscopic examination

Comment

The treatment of acute mercurial intoxication resolves itself into the management of the immediate poisoning and the delayed toxic effects of the drug The principles of emergency treatment are well established Attention is initially directed toward combating shock and facilitating the elimination and neutralization of the protoplasmic poison Shock is combated by efforts to maintain an adequate circulating blood volume, whole blood and plasma are the most effective agents available at present [3] Rejection of the mercury is accomplished spontaneously by vomiting and diarrhea shortly after ingestion Gastric lavage with protein-containing fluids is utilized to precipitate the mercury, and colonic irrigations are administered to aid removal of the poison from the large bowel Peters has warned of the dangers to the water and electrolyte balance (inherent) in prolonged lavage and irrigation [4] The use of sodium formaldehyde sulfoxylate to convert the mercuric ion to the insoluble mercurous ion has been advocated, but it is of questionable value and may be toxic if its administration is delayed [5,6]

If these measures are not promptly applied or are inadequate, then a significant amount of the drug is absorbed, and the mercury is concentrated at the sites of elimination, where the greatest toxic action is consequently exerted [7,8] Oliguria, colitis, and stomatitis result Anuria is the dreaded complication of acute mercurial intoxication In the series of Hull and Monte, 37 of 40 patients who suffered anuria for twenty-four hours or longer died [9] No patient survived who was anuric for more than three days Of the 72 fatal cases, the authors note that "excluding shock, relatively few died without uremic manifestation" The search for extrarenal factors in the production of anuria is essential throughout

the period of anuria However, distinction must be made between the early anuria due to in adequate circulating blood volume caused by vomiting diarrhea, and shock, and the later anuria which persists in the face of normal or increased circulating blood volume and is due to damage of the renal tubules [10] Standard text-books often fail to distinguish between these two phases of therapy, and the administration of large volumes of fluid (up to 10 L per day) has been advised [8] This distinction is therapeutically significant. Several months ago, a twenty-one year-old white man in acute anuria was received at this hospital He had been given 10 L of fluid intravenously in the forty-eight hours prior to admission in an attempt to 'open up" the kidneys Shortly after admission he died in massive pulmonary edema Bell notes that 'from the histologist s point of view it is difficult to see how any treatment could force necrotic cells to function It is also clear that the forcing of fluids is of no value in anuria of this form "[11]

It was recognized in our case that the anuria manifested at the time of admission to this hospital was probably due to intrinsic renal disease Although it is understood that the optimum time for administration of BAL is within three and one-half hours after the mercury has been ingested it was started forty-eight hours after the poisoning in the hope that it might neutralize any mercury concentrated either in the alimentary tract or kidneys [12 13] The previously described toxic effects of BAL were noted The possibility that the BAL contributed to the inhibition of the diuresis is not great.[14] The specific effect of the BAL in this instance cannot be evaluated

However, at this time no purpose could be seen in the use of the previously described measures which are directed primarily toward neu tralization of toxins by lavage and irrigation and toward combating acidosis by the intravenous administration of large amounts of sodium containing fluids [15,16] Our therapy was directed toward the maintenance of electrolyte equilibrium and the avoidance of pulmonary edema The patient was placed on a protein free salt-free diet (1,500 to 2,500 calories daily), which was maintained up to the start of diuresis The freedom from exogenous protein was introduced because of the anticipated short course of the illness *and the desire to use the endogenous* protein breakdown as a guide to the course of the azotemia [17 18] The salt free diet allowed the addition of measured amounts of sodium chloride and sodium bicarbonate to prevent severe aci dosis Fluids were restricted to less than 1 000 cc per day to replace the loss by insensible per spiration [19] No evidence of hemoconcentration was noted as manifested by the hematocrit. The marked diuresis in the presence of diarrhea indicates that in the presence of anuria, small amounts of fluids suffice to maintain an adequate circulating blood volume The slightly in creased serum potassium may indicate a release of intracellular water to the extracellular com partment Under this regimen, diuresis occurred on the ninth day following the onset of anuria With the establishment of diuresis fluids were increased to replace the output chlorides were administered in the form of sodium chloride to replace the chlorides lost in the diuresis and pro teins were gradually introduced into the diet [20 21] Despite the diuresis, the azotemia fell gradually and the specific gravity of the urine remained fairly fixed in its resemblance to glomerular filtrate [22 23] Examination of the patient six months later revealed a normal blood urea nitrogen a normal phenolsulfonphthalein test, and good urinary concentrating power

On the basis of available prognostic criteria this patient's chances for recovery were ad mittedly few [8 11] The ingested dose was large vomiting delayed, and the initial shock was followed by persistent anuria It is to be noted that the patient was relatively comfortable during this period of anuria despite the progressive azotemia This is ascribed to the adequate hydration maintained predominantly by oral fluids, the prevention of severe acidosis and the freedom from circulatory embarrassment Fish berg cautions that the excessive administration of fluid involves the danger of precipitating cardiac failure [24] Kugel in his review of 13 patients with acute anuria noted that nine showed clinical and pathologic evidence of pulmonary edema.[25] Only one lived more than nine days In Wol paw s and Adler's series, three patients died of pulmonary edema and the fourth died after aspiration of gastric contents [26] All died before the ninth day of anuria Case 2 of Campbell died of pulmonary edema on the seventh day [17] Iucké and others note the high mortality in the early days of anuria.[1,27]

Our experience is in keeping with others that spontaneous resolution of acute toxic anuria may be expected to occur from the eighth to the twelfth days Bell stressed the regeneration of tubular epithelium after the first week [11] Con sequently it appears that the treatment of a *potentially reversible anuria is to maintain the* patient until renal repair from the toxic insult can occur By the same token it is essential that the precipitation of pulmonary edema and severe electrolyte imbalance must be avoided It also becomes apparent that reports of cures or improvement by mechanical measures should be evaluated with caution Kugel questions

two reported cases of "successful" unilateral renal decapsulation [25] In these instances, decapsulation anteceded diuresis by several days Diuresis occurred on the eleventh and twelfth days, when spontaneous diuresis may be anticipated

A recent case report concerns itself with a patient who ingested a large dose of mercury with subsequent anuria [28] On the fourth day of anuria following the administration of large volumes of intravenous fluids, peritoneal lavage was started Prolongation of life, despite peritonitis and generalized edema, is ascribed to peritoneal lavage Here too, it is questionable how much prolongation of life can be attributed to the peritoneal lavage which was started in the "prediuretic phase" of the anuria [25] Each of the measures available at the present time, including artificial kidney, intestinal loop perfusions, and peritoneal lavage, has inherent difficulties and dangers [29 30] We feel that these mechanical measures should be initiated only after an adequate period for spontaneous recovery has been permitted and that the need for them will often be obviated by judicious administration of fluids and careful attention to preservation of the normal electrolyte pattern

Summary

A case of acute mercurial intoxication is used to illustrate the principles that have been found effective in aiding the recovery from reversible anuria The tendency to spontaneous resolution of the anuria is stressed as well as the anticipated time of its occurrence Because of the reversible nature of the kidney lesions, caution is advised in interpreting the efficacy of advocated mechanical means in the treatment of anuria

Addendum

Since the preparation of this paper, we have successfully managed another case of anuria due to bichloride of mercury intoxication

Case 2 —The patient, a 28-year-old Puerto Rican woman, attempt to induce an abortion by vaginal introduction of 2 5 Gm of bichloride of mercury in tablet form on January 21, 1948 She was transferred to the Mount Sinai Hospital on January 26, 1948, on the fifth day of anuria with symptoms of severe ulcerative vaginitis, stomatitis, and colitis She was treated with the Kolff artificial kidney for six hours shortly after admission There was a drop in the blood urea nitrogen from 110 mg per cent to 31 mg per cent at the end of six hours The blood creatinine, uric acid, and phosphorous levels fell from abnormally elevated to normal levels However, the anuria persisted, and azotemia again became progressive On February 4 the blood urea nitrogen had reached 115 mg per cent, but the serum chlorides and carbon dioxide combining power were maintained within normal limits by means of oral administration of sodium chloride and sodium bicarbonate Only minimal edema was noted during the entire illness Twenty cubic centimeters of urine was obtained on the eighth day following the onset of anuria, and by the twelfth day the urinary output had increased to 1,200 cc in twenty-four hours Since then, the patient has continued to void large volumes of urine, up to 5,000 cc daily, with specific gravity ranging from 1 010 to 1 012 The blood chemistries, including urea nitrogen, creatinine, uric acid, phosphorous, calcium, carbon dioxide combining power, were all normal

The specific role of the artificial kidney in this instance will be discussed in a future publication Resolution of anuria and oliguria occurred approximately seven days after the artificial kidney had been applied In this instance, recovery of the patient may be attributed to the use of the Kolff artificial kidney and to the meticulous care in controlling the fluid and electrolyte balance

ACUTE URINARY INFECTIONS IN INFANTS AND CHILDREN

MEREDITH F CAMPBELL, M D New York City

(From the Department of Urology, New York University College of Medicine)

ACUTE urinary infection in infants and children is of sufficiently high incidence and potential gravity to merit serious clinical consideration despite increased pediatric acuity and our newer chemotherapeutic agents The mortality of acute renal infection in infants is approximately 3 per cent, becoming less in older children In this communication will be considered the pathogenesis and treatment of the usual nontuberculous renal infections as well as complicating surgical renal conditions which may seriously endanger the life of the patient and increase the therapeutic difficulties In urinary infection renal involvement must always be considered to exist until proved otherwise and merits the prime consideration

Pathogenesis of Renal Infection

Commonly, all urinary infections in children have been loosely, and pathologically inaccurately, designated as pyelitis. The usual renal lesion in these cases is an interstitial suppurative nephritis and involvement of the kidney pelvis may be clinically disregarded

The hematogenous route is the usual one in bacterial invasion of the kidney Doubtless in some instances and particularly where there is lower urinary tract infection and obstruction, retrograde or ascending renal infection by vesicoureteral reflux occurs Lymphatic bacterial spread to the kidney is generally lymphohematogenous from an infected lower urinary tract or other focus The regional lymphatic drainage transmits the absorbed bacteria to the lymphatic (thoracic) duct, and thence it is transported to the circulating blood

Bacteriology—The older pediatric texts taught that over 90 per cent of urinary infections in children result from colon bacillus invasion but modern bacteriologic studies of properly collected specimens suggest that not more than half these infections are due to gram negative bacilli and of these organisms many are not Escherichia coli, E communis, or E. communior but are Bacillus proteus, B pyocyaneus, B aerobacter and other rarer forms Gram positive cocci comprise nearly all the remainder of these infections, and of these, Staphylococcus aureus has been of highest incidence in my experience with various forms of streptococcus, including S fecalis appearing in about a fourth of the cases In half of all cases of renal infection the bacterial involvement is mixed and colon bacilli are present in about a half of these The primary source of the gram negative bacilli is the intestinal tract Gram positive cocci frequently appear in the urine coincident with or following acute upper respiratory infections, particularly of the acute sore throat variety Dental foci do not have the causative importance that they so often have in urinary infection in adults

Predisposing Factors—Urinary obstruction is the commonest predisposing factor in the genesis of urinary infection In children nearly all of these obstructive lesions are congenital These obstructions range from congenital stenosis of the prepuce and meatus to stricture of a renal calyx. The urinary tract structures above the point of obstruction are congested by urinary back pressure, and their local resistance is correspondingly diminished As the obstruction persists and increases, urinary stagnation or constipation likewise increases as does renal damage

As a therapeutic corollary the establishment of free urinary drainage is of prime importance, despite the fact that today with the employment of mandelic acid, sulfonamide, penicillin, or streptomycin according to bacteriologic indication, we are able to sterilize the urine in most cases although there exists unrecognized or untreated urinary obstruction Therefore, even though the urine can be sterilized in these cases by modern chemotherapy, these patients should not be discharged as cured without at least an excretory urographic study to demonstrate that the upper urinary tract is morphologically normal Successful sterilization of the urine by methenamine warrants the assumption that no important obstruction exists but this does not hold with present-day chemotherapy

The hematogenous bacterial invasion may localize in the glomerulus the afferent vessels or more particularly in the efferent vessels which pass from the glomerulus to course in the interstitial spaces between the renal tubules as nutrients of these structures With mild bacterial embolism or good tissue resistance of the host the infection process is neither clinically evident nor is there perceptible scarring on healing But with increased virulence of the bacteria or more massive emboli the inflammatory lesion in the interstitial spaces is correspondingly greater

Presented at a meeting of the Nassau County Pediatric Society Garden City April 12 1948.

and more severe There is also pronounced perivascular leukocytic reaction with cloudy swelling of the epithelial cells lining the adjacent collecting tubules As this process becomes more advanced, in serial section we can see leukocytes extruding their way between the swollen epithelial cells into the lumen of the tubule These leukocytes constitute the bulk of the pus found in the urine and, with severe interstitial suppuration, irruption of minute interstitial perivascular abscesses occurs with the passage of large amounts of purulent debris into the collecting tubules and thence to the bladder

It is this interstitial suppurative lesion in the renal parenchyma which creates the grave clinical and therapeutic problem in these cases, for, with complicating obstruction peripherally or with usually severe bacterial invasion, the entire kidney may be converted to a grossly purulent structure Large amounts of functioning secretory tissue are thereby destroyed, and the remaining tissue is functionally handicapped by massive generalized scarring consequent to the healing process In some cases the suppurative process advances to pyonephrosis and, when unilateral, nephrectomy is required

Healing of these badly damaged kidneys brings about stricturization of collecting renal tubules within the parenchyma itself, which interferes with free urinary drainage and healing of the subtendent lesions Perpetuation of the infectious process results This explains the therapeutic failure in many cases of bacteriocide-resistant renal infections Moreover, the resulting sclerotic process explains the picture of chronic interstitial nephritis subsequently observed in so many of these cases This is not to infer that this is the genesis of all cases of interstitial nephritis, but certainly there is evidence to indicate that bacterial invasion is a frequent factor

Clinical Considerations and Diagnosis

The clinical picture of acute urinary infection is so well known as to merit no description here Infants and the very young are in general more seriously ill, toxic, and prostrated than are older children Frequently and because of the clinical picture, the diagnosis of grippe satisfies the physician until outstanding manifestations of urinary tract involvement appear, or perchance the laboratory reports pus in the urine It is notable that in half the cases of renal infection, vesical and other localizing symptoms are absent There may be pain over one or both kidneys, hematuria, or frequency of urination As a rule the renal involvement is bilateral A shaking chill in a young child usually means acute pyelonephritis

Urinalysis of a properly collected specimen should be part of complete physical examination of any patient and is demanded as part of the examination of every sick child This implies catheterization in females of all ages, and also of males when collection of a voided specimen is uncertain or impossible In the male, with the prepuce retracted, the glans and separated meatus are well washed with an antiseptic solution such as oxycyanide of mercury 1 500 The child is asked to void and, after a small amount has been passed, a sterile receptacle is introduced into the stream for collection of the specimen for routine urinalysis and bacteriologic culture Unless these precautions are observed, urinary contamination by genital debris in each sex is likely and bacteriologic studies are both valueless and misleading Similarly, collected specimens are utilized for test of cure, no patient should be discharged as cured until at least two properly collected specimens have been proved sterile by culture

Examination of the urine for pus should be made upon a freshly voided uncentrifuged specimen, and more than three to five leukocytes below power field are abnormal We are not interested in whether the pus is clumped or is found as single cells, but we must be certain that these cells are true leukocytes by demonstration of the polymorphonuclear or "pawnbroker's" nucleus Too often desquamated epithelial and other detritus is reported as pus The presence of pus-casts in the urine at once establishes the diagnosis of pyelonephritis Examination of uncentrifuged specimens obviates inaccuracies concerned with the time and speed of centrifuging For quick identification of the invading bacteria, the sediment of a centrifuged specimen is gram-stained, and this will indicate whether the infection is gram-negative bacillary, gram-positive coccal, or mixed Moreover, this will at once suggest the correct choice of chemotherapy according to bacteriologic indication For example, in bacillary infections penicillin is useless (Table 1)

Most acute urinary infections in children are spontaneously cured clinically in two or three weeks with disappearance of fever, gastrointestinal disturbances, and/or urinary symptoms Yet in such cases bacteriologically examined six months later, positive urine cultures will be found in over half, indicating that the child is clinically well but not bacteriologically cured With physical debilitation or the acquisition of acute infection elsewhere, exacerbation of the smoldering, unsuspected, persistent urinary infection is almost certain to occur This is usually designated as "recurrent pyelitis" Such a clinical history practically always denotes

TABLE I.—CHEMOTHERAPY IN ACUTE URINARY INFECTIONS

Dose (4-hr average)	Mandelic Acid* (Ammonium or Calcium Salt) (Gm.)	Sulfonamide* ** (Gm.)	Penicillin† (Units)	Streptomycin† (Units) (Gm.)
Under 2 years	2–4	0.5–1.0	50,000	500,000 0.5
2 to 4 years	4–6	1.0–1.5	100,000	750,000 0.7
5 to 8 years	6–8	1.5–2.0	250,000	1,000,000 1.0
8 to 12 years	8–12	2.0–3.5	500,000	1,500,000 1.5
Adults	12–15	3.0–5.0	500,000–1,000,000	2,000,000 2.0
Bacteriologic indication	E. coli group Communis Communior Freundii Aerobacter group Aerogenes Cloacae Pyocyaneus (pseudomonas) Proteus vulgaris*	E. coli group Communis Communior Freundii Aerobacter group Aerogenes Cloacae Pyocyaneus (pseudomonas) Proteus vulgaris*		E. coli group Aerobacter group P. vulgaris Pyocyaneus
Gram-positive cocci	Staphylococcus Streptococcus B. fecalis (enterococcus)	Staphylococcus Streptococcus	Staphylococcus Streptococcus Hemolytic Anaerobic Gonococcus	May inhibit, but penicillin preferred
Ineffective against	* B. proteus (unless urine highly acid)	Enterococcus (B. fecalis)	Gram-negative bacilli	
Urine reaction‡	Must be more acid than pH 5.5. Mandelic acid concentration greater than 0.5 per cent Ammonium chloride Calcium chloride Ammonium citrate Dilute HCl q.s.	Preferably alkaline. Combining terms of sodium bicarbonate or potassium citrate q.s.		

* Oral 5 to 8 days.
** Sulfathiazole preferred for gram-positive cocci. Sulfadiazine preferred for gram-positive bacilli.
† Intramuscular 4 to 6 days.
‡ Best estimation by potentiometer or nitrazine paper or solution.

urinary stasis due to obstruction or unrecognized neuromuscular disease and of itself demands complete urologic examination to determine why the infection recurred.

Treatment

The acutely ill patient is given the usual sick-room attention with quiet and rest. It is important that free bowel elimination be instituted promptly by enema, laxation or colonic irrigation. An increased fluid intake is indicated. Examination of the properly collected gram-stained urine sediment will disclose the type of bacterial invasion, and therapy, as indicated in Table 1, is instituted at once. Intensive chemotherapy for five or six days is usually adequate, and generally during this time the child will return apparently to normal. A re-examination of the urine will then show whether bacteria are still present and, if none are found, a culture of the urine is made three to four days later. Cultures made during or promptly at the cessation of chemotherapy are likely to be falsely negative, but cultures made after three or four days will disclose surviving bacteria. If the culture is sterile another should be taken in two to four weeks and if this is likewise sterile the child may be considered cured.

If the child is not cured the chemotherapeutic course should be repeated, often employing another drug known to be effective against the demonstrated bacteria. For example mandelic acid and sulfonamide compounds may, for the most part, be used interchangeably. Penicillin is of no value in gram negative bacillary infections whereas streptomycin is often curative although it is less effective than penicillin against most gram positive coccal infections.

Persistent Acute Urinary Infection

When acute urinary infection remains so for four to six days and shows no response to intensive medical therapy a complete urologic examination is indicated irrespective of the age sex and condition of the patient. At the very least, an excretory urographic study should be made. This may be unsatisfactory because of conflicting gas shadows consequent to toxemia or to immobilization of the patient in bed. This study often gives a suggestive clue especially when it demonstrates obstruction in the upper urinary tract or there is evidence of good renal function on one side with little or none on the other. Cystoscopy ureteral catheterization divided renal function tests, and retrograde pyelography should complete the examination.

It is notable that investigation in practically every child, examined because of the criteria given here will disclose a surgical lesion of the kidney usually unilateral. In my experience the commonest condition found under such circumstances has been acute infected hydronephrosis with congenital stricture at the ureteropelvic junction. Extensive interstitial suppurative involvement adds to the kidney damage and the grave clinical picture. In such cases the

institution of temporary renal drainage by indwelling catheter in the kidney pelvis will usually tide over the patient until chemotherapy will effectively control the infection

Unfortunately not all patients with severe complicated renal infection will respond favorably to conservative treatment Usually in these cases, and when the general condition of the child permits, the indicated surgical intervention must be carried out This means nephrostomy if it seems likely that the kidney can be preserved by ureteropelvioplasty, either at the time or subsequently If the kidney is hopelessly injured or the grave condition of the child demands, employ prompt nephrectomy

In some cases in which the clinical picture is that of persistent hyperacute renal infection, surgical exploration reveals massive focal suppurative nephritis with the kidney riddled from pole to pole with small and large abscesses Frequently there is secondary perinephritic abscess Here nephrectomy is necessary and, if indicated, drainage of perirenal abscess This assumes that the other kidney has been demonstrated competent to sustain life

Renal carbuncle, so-called because of its gross appearance, is a metastatic renal infection predominantly due to S aureus and is usually unilateral Secondary perinephritic abscess is common, and the clinical picture generally causes the diagnosis of "acute pyelitis" to be made The probable diagnosis is made by urologic examination, and, unless simple renal decapsulation and removal of the carbuncle core appear likely to be curative, employ nephrectomy

Occasionally, both kidneys are involved, here the outcome in the past has usually been fatal, despite decapsulation, renal drainage, and intensive chemotherapy of the time Yet there is reason to believe that liberal administration of the antibiotics in particular will prove of inestimable value in the clinical control of some of these advanced destructive suppurative surgical renal lesions In short, "acute pyelitis" is decidedly something more than an inflammation of the pelvis of the kidney and should be so regarded by those entrusted with the care of the young Parenthetically, this problem is not greatly different in adults and children, it is only the young patients themselves who are different

Summary

In urinary infection, the kidneys must always be assumed to be involved until proved otherwise

Urinary infection is a common disease in infants and children, is often grave, and involves a definite mortality, particularly in infants

The important lesion in so-called acute pyelitis is generally an interstitial suppurative nephritis, and the bulk of the pus found in the urine in these cases originates in the interstitial suppurative lesions in the renal parenchyma This process may cause wide architectural destructive changes in the kidney, and many tubular units may be functionally endangered or lost by sclerotic healing

It is believed that acute renal infection and resulting sclerotic healing is the pathogenic basis in many cases later recognized as chronic interstitial nephritis

Early diagnosis is of utmost importance in acute renal infection, and urinalysis of a properly collected specimen is the keystone of the diagnostic arch Pus in the urine should be identified as polymorphonuclear leukocytes The nature of the invading bacteria is determined by gram stain of centrifuged sediment and by culture

Persistent "acute pyelitis" is an outstanding indication for prompt complete urologic investigation, which will almost always disclose a surgical complication of the renal infection demanding operative intervention with renal drainage or nephrectomy

Chemotherapy relies on the generous administration of mandelic acid preparations, sulfonamide compounds, and, probably best today, of the antibiotics penicillin and streptomycin

Only by close cooperation between physicians entrusted with the care of the young and their urologic colleagues can these children with complicated urinary infection be given the best prospect of survival and cure

No patient with urinary infection should be discharged as cured until the urine has been proved sterile by bacteriologic examination of properly collected specimens

Case Reports

FATAL HEMORRHAGE IN BOECK S SARCOID

ARTHUR A FISCHL, M D , F A C P and KARL FREIRICH M D , New York City

(From the Medical Service of Queens General Hospital)

IN 1889 Besnier described peculiar lesions of the fingers, nose, and ears which he called lupus pernio [1] The sarcoidosis of Boeck described ten years later consisted of similar lesions of the skin plus lesions of the lymph nodes and mucous membranes [2] In 1914 Schaumann recognized the fact that the lesions reported first by Besnier and later by Boeck were manifestations of the same disease [3] He called it lymphogranuloma benignum in distinction from Hodgkin s disease or lymphogranuloma malignum. The characteristic lung and bone lesions were described by Kuznitsky and Bittorf and by Jüngling [4 5] As scientific knowledge progressed the many features of the disease less apparent to the eye came to be recognized as part of the syndrome It was obvious that sarcoidosis was a systemic disease wherein the structures that were particularly involved manifested themselves most conspicuously It was also apparent that the disease was much more common than was originally supposed

During the past two decades partly due to the speculation that arose as to whether, etiologically this disease was in some way related to tuberculosis or whether it was actually an unusual form of tuberculosis (the so-called noncaseating type), and partly due to the tremendously more widespread use of the chest x ray sarcoidosis of Boeck has aroused the interest of internists pathologists and tuberculosis clinicians A good deal has been written on this subject. In reviewing the literature of the past twenty years and particularly of the past decade one finds that innumerable reports have been published These include series of cases and single case reports dealing with the etiologic pathologic and clinical features of this disease The symptomatology has been very adequately covered

Hemoptysis in Boeck's sarcoid is an extremely unusual symptom There are only two reports of such cases in the entire literature. The reference to the hemoptysis is only casual, implying that the bleeding was of minor significance. Rubin and Pinner recently published a review of 26 cases of Boeck s sarcoid which came to autopsy [6] Included in the review is a detailed clinical history of each case. In none of these cases is hemoptysis mentioned as a symptom Longcope and Pierson described eight cases in detail and did not mention hemoptysis occurring on one occasion [7] Longcope and Fisher, in case three of their series described a single episode of bloody expectoration [8] In a personal communication Dr I Snapper stated that in the absence of a tuberculous cavity he had never seen hemoptysis in sarcoid disease [9]

There is no report in the literature of a fatal hemorrhage occurring in this disease. The authors feel that since a caseating cavernous lesion of the lung was absent this case study is worthy of report

Case Report

The patient, G S was a 24-year-old white woman who was admitted to the medical wards of Queens General Hospital on August 3 1946 because of hemoptysis. Her family history was noncontributory Her past history revealed that in 1937 a routine chest x-ray was taken before college entrance. The presence of hilar adenopathy was reported then. She was sent to a sanatorium where she was told that she had infiltration in the apex of her left lung She remained there for six months, during which time she raised minimal amounts of sputum. Examination of all sputum specimens for acid-fast bacilli was negative.

After discharge from the sanatorium she returned to college and did well for a while but then found it necessary to cease her studies because the work was too fatiguing Her chief complaint at this time was dyspnea She was married in 1942

In May 1945 fifteen months before her present admission she had an episode of hemoptysis raising about one and one-half cupfuls of blood while at work The following fall she had another episode of hemoptysis and developed pneumonia following it She again spent six months in a sanatorium during which time all her sputa were negative for acid-fast bacilli and tuberculin skin tests were negative.

In May of 1946 she was seen by a private physician who gave her five radiation therapy treatments to her chest One week before admission she had another episode of hemoptysis continued to have blood-streaked sputum and then had still another episode of hemoptysis the day of admission to the Queens General Hospital

The significant physical findings on admission were as follows pallor and rapid respirations, temperature 102 4 F pulse 140 blood pressure 90/60 The eyes showed nystagmus on lateral gaze to the right There were palpable, discrete nontender axillary lymph nodes and a few small shotty inguinal nodes bilaterally The lungs revealed dullness on percussion over the superior mediastinum both to the right and left and dullness in the right chest posteriorly Numerous rales and rhonchi were heard over the mediastinum and

trachea anteriorly and posteriorly There were moist expiratory rales at the right base posteriorly and in the right axilla. The fingers were clubbed The remainder of the physical examination revealed normal findings

Course—The patient was bronchoscoped soon after admission The trachea and major bronchi were filled with blood, but no bleeding point could be found She was given penicillin, 50,000 units every three hours intramuscularly A transfusion of 350 cc of whole blood was given on the day of admission and caused a mild reaction On August 9, at 2 00 P M she had another hemorrhage She received 500 cc of whole blood with no reaction The next day she appeared slightly improved, but on the following day, August 11, she had another pulmonary hemorrhage She received another transfusion early on the morning of August 12 At 3 35 A M of this day she had another hemorrhage which proved fatal

The pertinent laboratory data revealed a blood count of 3,500,000 red blood cells and a hemoglobin of 12 5 Gm The white blood count was 31,000 The sedimentation rate was 54 mm in one hour The albumin-globulin ratio was reversed, the albumin being 2 3 and the globulin 3 7 per 100 cc.

Autopsy—The postmortem examination revealed a pale, well-developed, well-nourished white woman with evidence of nasal and oral hemorrhage superficially The chest cavity was obliterated by numerous fresh adhesions The trachea was deviated to the right The main bronchial walls were markedly dilated and thickened There were numerous areas of aspirated bloody mucus within the bronchioles The dilatation and thickening of the bronchial tree were most marked in the upper lobes of both lungs and were associated with fibrosis of the interstitial tissues The bronchial dilatation also involved the lower lobes, but to a lesser extent

The lungs were quite firm, particularly in the uppermost portions, were hypocrepitant, and cut with increased resistance They were pinkish-gray in color with no congestion, edema, or infarction evident The left lung was markedly atelectatic and the right lung correspondingly emphysematous The atelectatic areas involved the left upper lobe and a portion of the left lower lobe There was some questionable collapse of the right upper lobe

The heart was shifted to the left but otherwise normal The mediastinum manifested enlarged nodes particularly at the bifurcation of the trachea The nodes were firm and showed complete replacement of the normal architecture by a pale white, rather homogeneous infiltration of granular tissue The peribronchial nodes showed a similar but not so extensive enlargement The liver and kidneys were normal, but the spleen presented numerous, small, white, discrete areas measuring 1 to 3 mm in diameter These nodules were rather granular, isolated, and showed no tendency toward confluence The remainder of the organs were normal

The microscopic examination was done by Dr Alfred Angrist The lungs showed considerable diffuse fibrosis containing giant cells with some of the alveoli filled with monocytic and occasional epithelioid and giant cells Some smaller bronchi were dilated and filled with mucus Other sections showed marked bronchiectatic dilatation with regional inflammation of a nonspecific character with plasma cells predominating The vessels were rather thick walled with prominent fibrosis Some sections showed considerable atelectasis with rather diffuse epithelioid exudation and polymorphonuclear formation The septal tissues of the lung were markedly thickened Epithelialization of alveoli was prominent, particularly beneath the pleura Definite organizing pneumonitis was present in several sections (Figs 1–3)

The lymph nodes showed marked hyalin fibrosis and multiple areas of epithelioid tubercle, some being transformed to laminated hyalin fibrotic nodules In some instances the lymph nodes were almost completely hyalinized, other nodes showed an abundance of epithelioid tubercle structure both as isolated tubercle and in the form of masses Many of the epithelioid tubercles showed reticular fibrosis In the sinus zones, occasional masses of epithelioid cells and isolated giant cells were seen

FIG 1 Section of lung showing characteristic features of Boeck's sarcoid Note tubercle at upper margin

FIG 2 Magnification of Fig 1

FIG 3 *Diffuse fibrosis containing giant cells with some alveoli filled with epithelioid cells and organizing pneumonitis.*

The spleen showed diffuse congestion with the follicles persisting and some epithelioid tubercles and giant cells present. The kidney, thyroid, liver heart bone marrow and breast were not remarkable

Comment

Fatal hemorrhage in a patient with sarcoid disease of the lung must be extremely unusual. The literature was searched, and no report, with autopsy findings, of massive hemoptysis due to this disease was discovered It would not be unusual for a patient with sarcoidosis to have a fatal hemorrhage. Providing there was coexisting tuberculous disease with cavitation, the hemorrhage would be due to erosion of a large blood vessel. The association of these two diseases in the same patient has been reported. However, in the patient here described there was no evidence of tuberculous disease in the lungs on postmortem examination. Microscopically the exact bleeding point could not be found.

Summary

A fatal case of hemoptysis associated with sarcoidosis is reported This is a most unusual situation, and no previous reports of such an occurrence could be found in the literature.

MIX VACCINE-TOXOID SHOTS

Children will get better protection against diphtheria and whooping cough when the materials used for the antidiphtheria and antiwhooping cough shots are combined in one mixture instead of being given separately

Studies showing this are reported by Dr Joseph A Bell of the U.S Public Health Service in a report to the *Journal of the American Medical Association*. The studies were made in Norfolk Virginia, and neighboring territory, beginning in 1941

Children from the ages of two to 23 months were selected for the test and divided at random into two groups. One group was given an alum treated mixture of whooping cough vaccine and diphtheria toxoid. They got two shots of this, four weeks apart

The other group got whooping cough vaccine and diphtheria toxoid in separate injections

Of 407 children who got two doses of the mixed product, 48 got whooping cough Among the 385 who got two doses of the vaccine alone 158 cases of whooping cough occurred

A year after receiving the first injection, 992 children in the diphtheria study were given Schick tests, the standard method of determining immunity to diphtheria. A positive reaction to this test shows susceptibility to diphtheria. There were only one-third as many positive reactions in children who got the mixed product as in those who received unmixed toxoid

The mixed vaccine-toxoid shots are effective in babies as young as two to five months old and side reactions Dr Bell reports, are few and negligible But at least one of the doses, he advises should be given after a child is six months old for best protection.

DIRECT ABDOMINAL HERNIA

Joseph B Stenbuck, M D , New York City

THE patient whose case is described is one of three patients with the same type of hernia who were presented before the New York Surgical Society on February 25, 1948 They were men of middle age or older who were of similar strong body build with moderately obese abdomens All three gave very similar histories One of the three had bilateral direct abdominal hernias and a right inguinal hernia as well.

Case Report

M S , a man fifty-five years old, was the only one of the three patients operated upon He was admitted to the Mt Sinai Hospital Semi-Private Pavilion, January 19, 1946 He complained of a recurrent swelling of two years duration in the lower left portion of the abdominal wall There was no history of any injury, direct or indirect, which might have affected his abdominal wall He had had no major illnesses

His attention was drawn to the lower left portion of his abdomen by what he called a "squeak" in that region when he voided, even though no more than a normal intra-abdominal pressure was exerted Right after this he felt a lump about two inches in diameter in the same region He was able to reduce the lump digitally into the abdominal cavity The lump, grew larger, but it receded or was reduced easily, reappearing after any activity which increased intra-abdominal pressure The lump reached a size of approximately four inches in diameter Localized cramplike pains were felt at times, but there was no vomiting or constipation

In the region indicated in the diagram, a mushroom-type mass, about four inches in diameter, could be felt when the patient coughed (Fig 1) At the same time, a bruit was felt The mass was easily reduced into the abdominal cavity and then a defect one inch in diameter was felt deep in the abdominal wall. No abnormalities were found in the inguinal canal A diagnosis of direct abdominal hernia was made Examination of the inguinal canal was negative for hernia.

At operation, an oblique four-inch incision was made over the mass in the direction of the fibers of the external oblique muscle When this muscle was brought into view, it was found to be intact, but a mass bulged beneath it. An incision four inches long was made in the external oblique aponeurosis in the

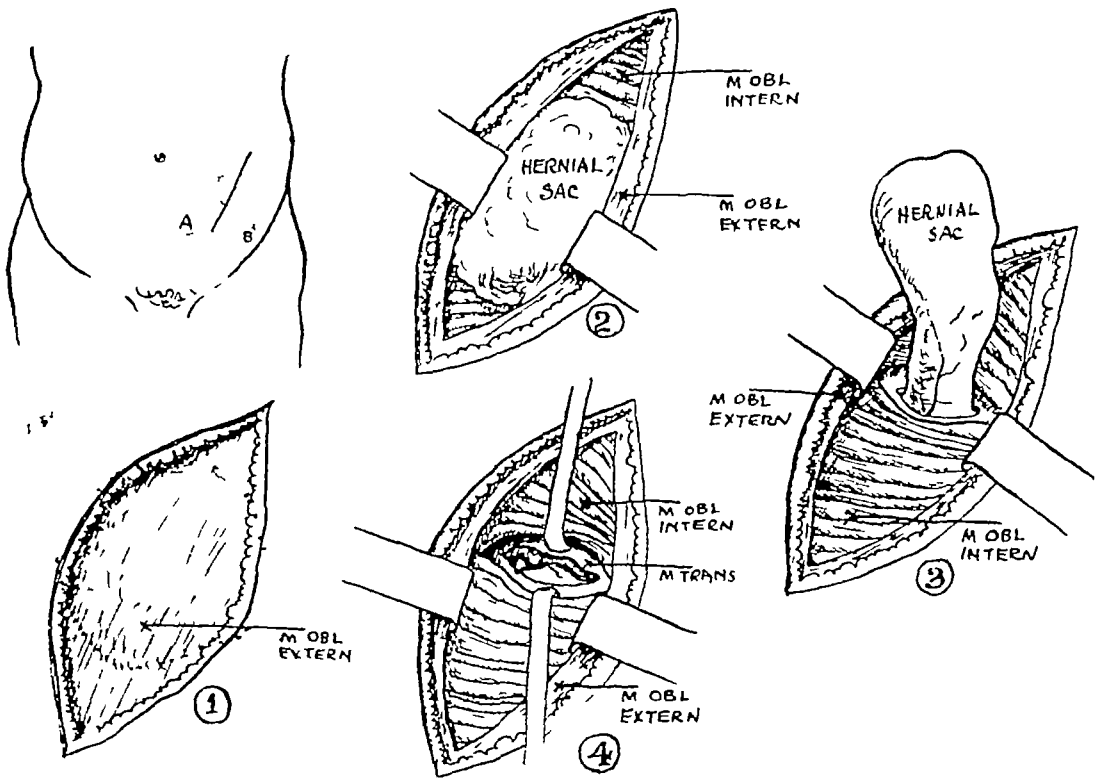

Fig 1 The picture of the lower abdomen shows the position of the hernia and the incision in the abdominal wall

1 The dotted line outlines the hernia beneath the external oblique aponeurosis
2 The external oblique muscle has been incised and the hernia is visible mushroomed beneath it
3 The hernia has been dissected free, and its relation to the fibers of the internal oblique muscle is seen
4 The hernial sac has been ligated and resected, revealing the direct defect it has produced in the transversalis muscle and the internal oblique muscle

direction of its fibers With retraction, the mush roomed mass was brought into view and was easily dissected from the surface of the internal oblique muscle upon which it lay and through the center of which it emerged On retracting the fibers of the internal oblique muscle, the mass was seen to come through a defect muscle about one inch in diameter in the transversalis

The mass proved to be a well-formed sac contain ing a process of omentum. A small artery emerged through the transversalis muscle defect and accom panied the sac.

A high ligation and resection of the sac was done and the layers of the abdominal wall were closed with silk sutures

Comment

It is possible that many hernias of this type may be missed since they do not protrude as hernias do in the inguinal region. Covered as they are by the external oblique aponeurosis they may cause symptoms which are not readily explained. In one case the mass was discovered only after the third visit and examination Examination was repeated because the patient was sure he had felt a lump

Differentiation was made from a Spigelian hernia, which comes through the abdominal wall at the lateral border of the rectus abdominis muscle at the level of the semilunar fold of Douglas In the case reported the hernia was about midway between the lateral border of the rectus abdominis muscle and the uppermost portion of the inguinal ligament The anatomic picture may be simplified by stating that the hernia had formed an opening exactly like the one we produce when we approach the appendix by way of a McBurney incision except for the fact that the external oblique muscle was intact

Two years after operation there was no sign of recurrence and there were no abnormal symptoms.

PRIZE ESSAYS

The Merrit H Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 2, 1949, in Buffalo

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York.

The Merrit H Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of a prize, it will not be awarded

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York 'to be published as it may direct"

All essays must be presented not later than February 1, 1949 and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York.

Committee on Prize Essays

INTESTINAL OBSTRUCTION WITH ILEAL PERFORATION SECONDARY TO INGESTED FOREIGN BODY

BERNARD J FICARRA, M D , Brooklyn, New York

(From the Department of Surgery, St Peter's Hospital)

PERSONS of all ages frequently swallow nondigestible materials The usual outcome is for the foreign body to be eliminated rectally without discomfort All types of nondigestible articles pass through the gastrointestinal tract without distress Among the objects which fall into this category are straight pins, open safety pins, nails etc In the management of these cases, conservative treatment has always been the procedure of choice Watchful waiting will often obviate the necessity for a laparotomy

Recently, an emergency operation was performed for an acute small bowel obstruction The findings at operation were so unusual that they are deemed worthy of presentation as a case report

Case Report

The patient was a 60-year-old white housewife who entered the hospital in May, 1947 The significant history commenced two days prior to admission On that day, in the evening, the patient had a dinner consisting of a bacon sandwich and several glasses of beer Fifteen minutes later, she developed pain in the abdomen which she attributed to the ingested food She took a mild cathartic, and several hours later her bowels moved copiously The stool was soft, black, and watery in consistency That night she could not sleep because of recurrent crampike abdominal pain The next morning her abdomen continued to be painful She felt very weak and vomited four or five times in rapid succession Her bowel movement was very scant In view of the persistent pain and vomiting, she entered the hospital that evening This was twenty-four hours following the onset of symptoms

The significant past history concerned an operation twenty years previously She had a total hysterectomy for fibroids and an appendectomy Since that time she had enjoyed good health

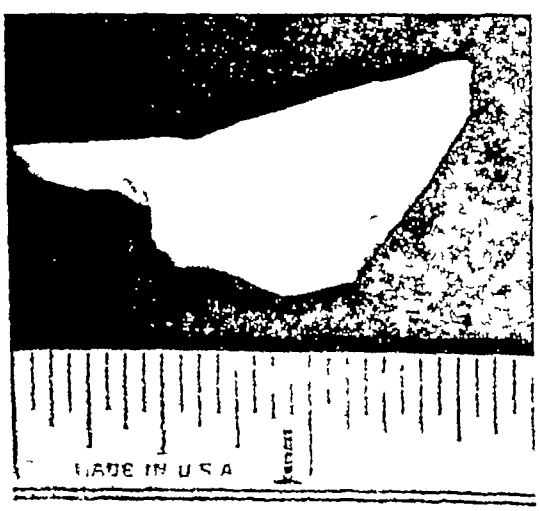

FIG 1 Actual size of bone removed at operation

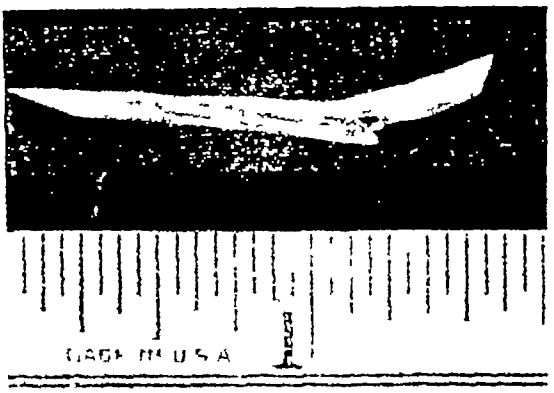

FIG 2 Side view of same specimen, illustrating spearlike character of the bone

Physical examination at the time of admission revealed a moderately obese elderly woman, dehydrated, obviously in pain, appearing acutely ill Her blood pressure was 174/80, pulse 110, respirations 30 The abdomen was very distended with marked tenderness over the midline operative scar Peristalsis was not typical of intestinal obstruction There was tenderness in both lower quadrants Vaginal and rectal examinations were noncontributory The preoperative diagnosis was intestinal obstruction with possible perforation of the intestine

After an adequate preoperative regime, including intubation with a Miller-Abbott tube, intravenous fluids, and plasma transfusions, the patient was subjected to exploratory laparotomy When the peritoneal cavity was entered, a moderate amount of grayish-white pus was encountered Plastic exudate was clearly visible over the small bowel The point of obstruction was a loop of ileum which was transversely adherent to the previous operative scar Another loop of ileum was twisted on itself forming a volvulus An adhesive band across the base of the volvulus compressed the involved segment of ileum This segment of ileum was pregangrenous in appearance but returned to its normal color when the obstruction was released The mesentery itself was moderately edematous The loop of ileum in this vicinity contained a large amount of plastic exudate The small intestine proximal to the obstructed area was moderately distended Approximately one foot from the original point of obstruction, i e , where the ileum was attached to the operative scar, a traumatic perforation through the antimesenteric border of the ileum was found. Through this perforation protruded a hard mass which was found to be a piece of bone (Figs 1 and 2) The sharp end of the bone pierced the ileum and was found protruding into the peritoneal cavity

In order to remove this bone, the traumatic perforation was slightly enlarged The perforation

was closed in two layers, the second layer with interrupted Lembert sutures of black silk The obstruction was eliminated A mixture of sulfathiazole and sulfanilamide was placed into the peritoneal cavity and the abdomen closed in the routine fashion.

The patient had a stormy postoperative course and expired on the second postoperative day

Discussion

The findings at operation in this particular case were not anticipated Interrogation of the patient following operation brought to light the fact that she had eaten chicken four days prior to the onset of her present illness. In view of the fact that she was edentulous she had the habit of swallowing her food without satisfactory mastication It was at this time that she might have swallowed the bone The usual course of events when a person ingests nondigestible material is to pass the object in subsequent bowel evacuations. In this particular case the patient developed a small bowel obstruction which was coincidental to and related to the ingested bone

The increased peristalsis which occurred in an attempt to overcome the obstruction was the precipitating factor in bringing about the traumatic perforation of the small bowel by this foreign body One edge of the bone was knifelike in character and very easily pierced the intestinal wall. If this patient had not developed a small bowel obstruction, she might have passed the object without distress. However the increased peristaltic activity associated with the obstruction resulted in the perforating of the ileum by the bone This perforation caused generalized peritonitis and the patient's eventual death

Summary and Conclusions

1 A case is presented in which an ingested spicule of bone *perforated the ileum producing a* generalized peritonitis This perforation occurred secondary to an acute intestinal obstruction due to postoperative adhesions

2 These findings were demonstrated at the time of operation

3 In spite of the removal of the foreign body the repair of the perforation and release of the obstruction the patient succumbed to generalized peritonitis on the second postoperative day

4 The unusual feature of this case is the occurrence of a traumatic perforation of the ileum secondary to an ingested foreign body (bone) associated with an acute small bowel obstruction

---

EARLY CARCINOMA OF THE CERVIX DETECTED BY THE VAGINAL SMEAR

LOCKE L. MACKENZIE, M.D. New York City

(From the Gynecological-Cytology Clinic Department of Gynecology the New York Post-Graduate Medical School and Hospital)

ALTHOUGH this case is not unique, it is felt that it is of sufficient importance to be included in the literature at this time when so much interest is being shown throughout the country in the cytologic diagnosis of cancer

Case Report

C. G., aged 46, divorced, para 0 gravida II, presented herself on October 15 1947, complaining of nervousness, tremor, and instability while walking Her menstrual periods had been entirely normal, and there had been no intermenstrual bleeding or discharge. She had lost no weight and there were no symptoms relative to any of the organic systems.

Physical examination was essentially negative. The abdomen was flat, and there were no masses or viscera felt No tenderness was present. The vaginal introitus was nulliparous but marital. The cervix appeared virginal. The uterus was anterior movable, normal in size and of normal consistency except for a small subserous fibroid on the anterior wall of the fundus. A routine vaginal smear was made, chiefly to determine if her symptoms might be explained on the basis of an early menopause.

The smear showed large numbers of cells diagnostic of squamous cell carcinoma. Upon re-examination no evidence of any cervical lesion was seen. She was admitted to the New York Post-Graduate Hospital on November 5 1947 The cervix was biopsied around the clock, and the uterus was curetted Nothing suspicious was noted in the cervix, and a normal amount of endometrium was recovered The pathologic report disclosed an endometrium in the luteal phase and one piece of cervix showed an intramucosal carcinoma The basement membrane was everywhere distinct.

Six days later a panhysterectomy and bilateral salpingo-oophorectomy was done. The pathologic diagnosis was leiomyomata of the uterus, multiple adenomyosis of the uterus normal fallopian tubes, ovaries and appendix and squamous cell carcinoma of the cervix, intramucosal type.

Convalescence was complicated by generalized peritonitis and intestinal obstruction Treatment was by multiple transfusions, intravenous sulfa therapy, penicillin and streptomycin in large amounts and mechanical gastric drainage these measures were successful, and she left the hospital on the eighteenth postoperative day

Discussion

The case is reported not because it is unique but because it is believed that such instances should be brought to the attention of the profession. There was absolutely no reason to suspect malignancy The diagnosis was made by the purely fortuitous circumstance of having taken a vaginal smear It is thought that this neoplasm would have progressed to produce symptoms and signs in the future. The probabilities of cure in this patient are much greater because the tumor was discovered in an early stage

RESIST BEGINNINGS

JOHN J MASTERSON, M D , Brooklyn, New York

(*President-Elect, Medical Society of the State of New York*)

THERE are sicknesses of communities and nations as well as of individuals We, as medical men, have come to address more attention than before to what we call psychosomatic ills, the effects of emotional strains and conflicts upon the physical condition By whatever name these disturbances may be called, they are all characterized by an inability of persons to get along well with others, which in turn is often a matter of having difficulty in getting along with one's self We need only to pick up the morning newspaper to see what this means in the international scene I believe I can say that today there are in the world more groups of people and more nations who are hating each other than there were before World War II

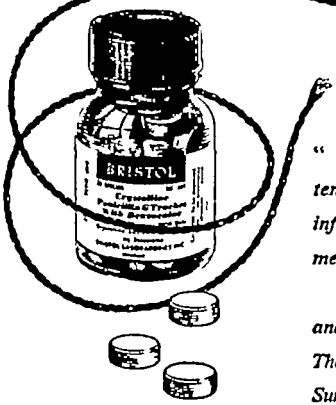
A prevailing idea today is that it is possible to get something for nothing People, individually and in groups, are more and more inclined to think it smart to over-reach each other, placing the emphasis on giving the least possible for the greatest reward, rather than giving the most possible for the sake of doing good work well We have gone a long way from the time when Grover Cleveland expressed the sense of the majority when he said that "The people support the government, the government does not support the people "

In agitation for compulsory sickness insurance we are in this country again confronted with the danger of collectivism, which is another word for socialism Just before Labor Day, President Truman advocated what he called "national health insurance " I do not need to tell you how damaging such a measure would be to the health of the people What is necessary to emphasize is the need for continuous and uninterrupted opposition to this kind of thinking, which is intellectually dishonest It is dishonest because it promises that the people are going to get something which, in reality, is never going to be delivered It is the first step toward authoritarian government in which the citizen becomes a slave of the state Even if the danger of the passage of such a law is not great, the need to combat this type of thinking remains of first importance, for the more prevalent it becomes, the greater the risk that step by step we shall slip gradually into a national state of mind more and more receptive to ideas which will ultimately mean the abdication of the citizen from control of his own private affairs

We must resist beginnings That is one of the old copy book maxims It was made into a little essay by John Bigelow For seventy years John Bigelow was a public servant, once Minister to France, associated with William Cullen Bryant on the *New York Post*, a man who devoted twenty-five years of his life after 1886 to founding and developing the New York Public Library His career was resurrected to public view in 1947 when Margaret Clapp's biography called *Forgotten First Citizen* won the Pulitzer Prize But, unfortunately, his thinking has not been resurrected In his little book, *Resist Beginnings*, he stated an obvious truth—an invincible and changeless truth—that each divergence from principle weakens our ability to meet the next temptation to do what we think is wrong As he put it, "Every concession changes our relations to everything and to everybody "

It is not enough that we, the medical profession, be aware of the disaster that is at the bottom of the cliff down which we are sliding The people must know it, too, for in this country the voice of the people can still be heard And the people are not going to take our word for it Enemies can say that we are seeking our own advantage We must summon witnesses who have no stake in the outcome, whose opinions are more likely to be considered objective

The most forceful presentation of this sort which I have ever seen is the report of the Brookings Institution recently published with the title, *The Issue of Compulsory Health Insurance*



The report reviews the growth of voluntary insurance both for hospitalization and for medical services It notes the recent changes in the amount and distribution of the earnings of the American people, which greatly reduce the number of those who cannot afford adequate medical care if they desire to purchase it Then the report concludes, "It would seem unwise at this time to substitute for these developments a system of compulsory health insurance by national law which would have the unfortunate tendency to freeze policies and eventually retard medical progress "

The crux of the President's proposal is compulsory sickness insurance We all know what this will mean in terms of deteriorated medical care for the public We shall be forced to practice mass medicine, responding to demands on our time which are not part of real medical care, with the resulting loss of self respect When the doctor loses the incentive to do his best for all patients that come to him, something catastrophic happens It has been said that the doctor is at fault who does not do his best for all his patients, no matter how many come to him Is not the doctor subject to fatigue, the same as anyone else? Does not the quality of what he gives his patients depend on the amount of time he can spend in study, in conference with his colleagues? Does it not depend on his keeping his own standards up at all times, which he cannot do when he becomes a link in a mass production line? People who think a doctor can see sixty or eighty patients a day and give each one the best that is in him have no conception of the nature of the practice of medicine

[Continued on page 2410]

The editors of the JOURNAL desire to emphasize the remarks quoted in an editorial in the issue of October 15 1948 by presenting at greater length excerpts from the address by the President-Elect, Dr John J Masterson at the Third District Branch annual meeting September 23 1948, at Schoharie

A STITCH IN TIME

" *The prophylactic use of penicillin tends to reduce postoperative inflammation of the oral mucous membrane and the incidence of infection There is less postoperative pain and healing is more rapid* " *Faier, A.D The Prophylactic Use of Penicillin in Dental Surgery Dental Digest, 153 336 July, 1947*

For either prophylactic or therapeutic purposes Bristol CRYSTALLINE PENICILLIN G TROCHES with Benzocaine provide an efficient means for controlling intraoral infections due to penicillin sensitive organisms Inserted into the buccal sulcus, the troche dissolves slowly, directly bath ing all accessible mucous membranes with an effective and prolonged concentration of penicillin In the presence of painful inflammatory or traumatic mouth lesions the local anesthetic effect of benzocaine will be found especially desirable

Each pleasantly flavored troche contains 5000 units of Crystalline Sodium Penicillin G, and Benzocaine 5 milligrams They are available from your usual source of supply in bottles of 20

SYRACUSE NEW YORK

[Continued from page 2408]

The public should know that it is not wise to act on such a proposal when the individuals who are expected to carry it out say it cannot be done The medical profession, which itself is charged with the responsibility for the health of the public, must make clear that under compulsory insurance patients are not going to get medical care as they know it today, but a brushoff

We must battle every inch of the way which leads to compulsion of the state over the individual We are to be robbed of our rights under the guise of extending our rights

We must resist beginnings We must examine with skepticism the gifts which the Greeks are bearing to us, to determine the nature of the specific poison with which they are inoculated We must awaken the patriotism of the American people to the fact that along this way lies the destruction of everything that we have cherished and defended Either we are going on to the socialized state and then to the authoritarian state, or we must stop right where we are now

URINE SEDIMENT IN PREGNANCY

A vaginal smear test for pregnancy was advocated as long ago as 1925 [1] The marked cyclic changes in form and glycogen content of the cells lining the vagina and uterus, and the possibilities of experimental reproduction of the female cycle through various endocrine treatments has maintained interest in the subject In the past few years studies on cancer diagnosis from vaginal smears have been numerous and the hope of early diagnosis of pregnancy also by smear examination continues The technic of study of the morphology of genital smears in cancer and during pregnancy requires special training

Papanicolaou has recently suggested an improvement in pregnancy diagnosis by the preparation of smears from urine sediment instead of from the cells discharged into the vagina [2] The urinary tract lining has its own characteristic changes in pregnancy Smears of the urinary sediment, Papanicolaou says, give a rather uniform cell appearance, convenient for study The effects of estrogens are clear upon urinary sediment, and he reports a characteristic cell of pregnancy, upon which further studies will be made It is not sufficiently clear cut early in pregnancy to displace the usual animal tests for ovarian stimulation, the Aschheim-Zondek and Friedmann tests, but it is informative

Simplification of the technic of pregnancy diagnosis, resting as it does upon an increasingly broad understanding of the hormonal mechanism of normal and abnormal pregnancy, will be a boon to clinical practice and will greatly advance diagnosis of early disease With so much activity and interest in this field, rapid progress in technic is inevitable — *Southern Medical Journal, July, 1948*

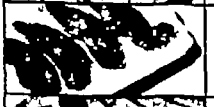
A NEW TROJAN HORSE

The antivivisectionists have used practically every dodge known to the deceiver



The newest is a Trojan horse known as the *National Pet Protection Patrol* This is a "nation-wide organization to help boys and girls learn how to care for their own pets and to protect dogs, cats, and other animals from all forms of cruelty," according to the Chicago *Herald American*

This organization is opened at no cost to all children six years of age or over A chapter organized in September, 1947, is said to have acquired 3,800 members in the public schools of Los Angeles in less than one year

The organization offers the usual bait to children by giving them free an engraved badge and an official membership card, thus creating a nation-wide organization of youthful Don Winslows on the prowl against cruelty to animals

On the surface no sane person with any tenderness in his heart for animals could object to this beautiful and idealistic purpose Only the cynic who looks beneath the surface would find the occupants of this Trojan horse and recognize them for what they are James H Crukshank, George R Farnum, Mrs Ehot Tuckerman, Ernest Weidhaas, and Verna Hayward of Los Angeles are all prominent in antivivisection movements This is an insidious example of penetration into public schools by special pleaders The success of this movement could mean the indoctrination of millions of school children with ideas contrary to the principles of scientific research, particularly in the fields of biology and medicine Unless school officials are warned, they might see little reason to question the desirability of education stressing kindness to animals Physicians and medical societies everywhere should call this menace to the attention of the schools—*Secretary's Letter, A M A , August 30, 1948*

The Abundant Nutrient Values of MEAT

KIND OF MEAT	COMPLETE PROTEIN	B VITAMINS			FOOD IRON
		THIAMINE (B_1)	RIBOFLAVIN (B_2)	NIACIN	
 PORK	EXCELLENT	EXCELLENT	FAIR	EXCELLENT	EXCELLENT
 BEEF	EXCELLENT	FAIR	EXCELLENT	EXCELLENT	EXCELLENT
 LAMB	EXCELLENT	FAIR	GOOD	EXCELLENT	EXCELLENT
 VEAL	EXCELLENT	GOOD	GOOD	EXCELLENT	EXCELLENT
 VARIETY MEATS (LIVER, HEART, KIDNEY)	EXCELLENT	EXCELLENT	EXCELLENT	EXCELLENT	EXCELLENT
 SAUSAGE (FRANKFURTERS, BOLOGNA)	EXCELLENT	GOOD	GOOD	GOOD	EXCELLENT

ALL VALUES ARE BASED ON COOKED MEATS . . . MEAT ALSO SUPPLIES SIGNIFICANT AMOUNTS OF COPPER AND PHOSPHORUS

While its high content of biologically complete protein ranks meat among man s best protein sources, its contribution of many more indispensable nutrients further enhances its over all desirability in the daily dietary

As is readily seen in the chart above, every kind of meat is an excellent source of high quality protein and of iron Meat further supplies significant amounts of the three B complex vitamins, thiamine riboflavin and niacin Certain cuts and kinds of meat are as a matter of fact, among our richest food sources of thiamine and niacin All meat regardless of grade or cut makes these contributions.

Due to the excellent digestibility of meat—from 96 to 98 per cent—the metabolic availability of its protein and other nutrients is virtually assured making it particularly valuable in many disease conditions in which these nutrients are especially needed.

NECROLOGY

Sidney Jay Furst, M D, of New York City, died on September 9 at the age of sixty-five Dr Furst was a graduate of the College of Physicians and Surgeons, Columbia University, in the year 1908 A staff member of St Elizabeth's Hospital, he was head of the physiotherapy department of Morrisania Hospital He was formerly associated with the Lutheran and Fordham Hospitals and was a member of the William H Luckett Medical Association of the former hospital Dr Furst was a member of the American Medical Association, the American Congress of Physical Medicine, and the New York State and County Medical Societies He was also a past-president and treasurer of the Audubon Medical Society

Nathaniel Read Norton, M D, seventy-seven, died on October 1 Dr Norton had practiced medicine in New York City for more than fifty years when he retired in 1946 Following his graduation from the College of Physicians and Surgeons, Columbia University, in 1894, he served as resident physician at Presbyterian Hospital and the New York Hospital and started his private practice in 1898 From 1904 until 1910, Dr Norton was an instructor at Cornell Medical College and from 1911 to 1921 at the College of Physicians and Surgeons From that time until 1931 he served as clinical professor of diseases of children at the latter school

Dr Norton was attending physician at Babies' Hospital and consulting physician at the New York Orthopedic Hospital and the Northern Westchester and North Country Community Hospitals He was a member of the American Medical Association, the New York Academy of Medicine, the New York Clinical Society, the New York Medical and Surgical Society, the Hospital Graduates' Club, and the New York State and County Medical Societies

John Alfred O'Regan, M D, of New York City, died on October 6 Dr O'Regan was fifty-five years old He obtained his medical degree from McGill University, Montreal, and interned at the Royal Victoria Hospital there and at Bellevue Hospital in New York City During the first World War, he served with the British Army Medical Corps in India and Mesopotamia

In 1922 and 1923 he served as resident house surgeon at the old Lying-in Hospital Since 1932 Dr O'Regan had served as an associate clinical professor of obstetrics and gynecology at the Cornell University Medical College Other posts which Dr O'Regan held include associate in gynecology at the former Skin and Cancer Hospital and membership on the courtesy staff of Booth Memorial Hospital

Dr O'Regan was president of the Lying-in Hospital Alumni Association and a member of the American Medical Association, the New York Academy of Medicine the Society of Alumni of Bellevue Hospital, the New York Obstetrical Society, the Celtic Medical Society, and the New York State and County Medical Societies He was also a diplomate of the American Board of Obstetrics and Gynecology and a fellow of the American College of Surgeons

Rudolph E Pick, M D, of New York City, died on September 21 at the age of sixty-six Dr Pick was graduated from New York University and Bellevue Medical College in 1903 He was a physician on the staff of Metropolitan Hospital and was a member of the American Medical Association and the New York State and County Medical Societies

Carl Pototzky, M D, died in his New York City home on September 21 His age was sixty-eight Dr Pototzky, associate pediatrician of Sea View Hospital, Staten Island, and a former member of Mount Sinai Hospital, was graduated from the University of Breslau in 1903 He came to the United States from his native Germany in 1938, having been forced by the Nazis to give up his position as director of the Guidance Clinic for Nervous and Mentally Retarded Children at Kaiserin Augusta Victoria Hospital in Berlin He had founded the clinic in 1918 and served as director until 1934 Dr Pototzky was a member of the American Medical Association and the New York State and County Medical Societies

Alexander M Stewart, M D, seventy-five, of Naples, died on August 28. Dr Stewart, who retired five years ago, was graduated from Syracuse University College of Medicine in 1903 and immediately started his practice in Atlanta, New York In 1912 he went to Naples, New York, and had practiced there ever since Dr Stewart served as a consultant surgeon on the staff of Frederick Ferris Thompson Hospital, Canandaigua, and was a member of the American Medical Association and the New York State and Ontario County Medical Societies

Stanley Bishop Thomas, M D, of Brooklyn, died on September 6 at the age of seventy Dr Thomas, who was recently made a surgeon-emeritus of the staff of St John's Hospital, Brooklyn, was graduated from McGill University Medical School, Canada, in 1903 and interned at the Presbyterian and Lying-in Hospitals, New York City In World War I he served as a captain in the army Dr Thomas was a member of the surgical staff of St John's Hospital for thirty years and also served on the surgical staffs of Long Island College and Kings County Hospitals He was a founder and past-president of the Flatbush Medical Society, a fellow of the American College of Surgeons, and a member of the American Medical Association, the New York Gastroenterological Society, and the New York State and Kings County Medical Societies

Virus pneumonia may cause bronchial dilatation, this may be temporary or permanent —*Exchange*

Case History of an overweight streetcar-operator

'Dexedrine' Sulfate—because it curbed appetite and lowered food intake—enabled even this extremely obese patient to lose weight easily and safely without the use (and risk) of such potentially dangerous drugs as thyroid

Patient before treatment (age 53, height 5' 10½") weighed 352 pounds . was suffering from hypertension, nervousness and dyspnea . . . lived in fear of causing an accident while on duty Overeating was the only demonstrable cause of his obesity

Therapy Dexedrine' (15 mg A C t i d)	Results	Weight	B P	Pulse
March, 1946	'Dexedrine' therapy begun	352	280/152	86
November, 1946	8th month of 'Dexedrine' therapy	269	160/84	86
January, 1948	22nd month of 'Dexedrine' therapy	234	158/84	86

In addition to the weight reduction of 118 pounds and the concurrent lowering of blood pressure, a remarkable improvement is reported in the patient's mood and outlook. Earlier nervousness and fears have vanished

Dexedrine* Sulfate tablets and elixir the most effective drug for control of appetite in weight reduction

Smith Kline & French Laboratories Philadelphia

MEDICAL NEWS

N Y U -Bellevue Center to Expand Its Fellowships

THE regional plan of the New York University-Bellevue Medical Center, in which physicians attached to nonteaching hospitals in suburban and rural communities receive fellowships at the center, will be expanded as a result of the successful first year, it was announced recently

The plan's first annual report said that the program would be expanded from seven to ten hospitals, with hospitals in Connecticut and Delaware joining those in upstate New York, Long Island, and New Jersey in the program

The project is supported by grants from the W K Kellogg Foundation, and 50 hospitals within 150 miles of New York have requested participation, the report said

Under the plan, resident physicians of affiliated hospitals spend an academic year at the medical center participating in basic science studies and subjects applicable to their specialties The hospitals maintain their students, but there are no tuition fees Members of the university's medical faculty visit the hospitals on request for conferences, seminars, and other activities

The seven hospitals who will continue their affiliations next year are Grasslands, Valhalla, New Rochelle, New Rochelle, St Luke's, Newburgh, Flushing, Long Island, Fitkin Memorial, Neptune, New Jersey, Monmouth Memorial, Long Branch, New Jersey North Country Community, Glen Cove, Long Island

Cornell Will Survey Town's Eating Habits

THE town of Groton, termed by Cornell University professors a "typical American community," will serve as a testing ground in a survey of eating habits to be conducted by Cornell's School of Nutrition

Representatives of the School of Nutrition began the selection of 300 families of the Tompkins County Township who will form the nucleus of the survey

Almost all families have preferential menus, Dr L A Maynard, director of the school, says in explaining the survey Some families follow one pattern of eating, some another, and some just eat, apparently without a pattern

Among the things the project should prove, Dr Maynard hopes, are the following

Does a family's educational level, economic level, composition of the family, or availability of food govern what those families eat?

A determination of the type of food used by the average family, how well nourished the families are, what factor determines the type of food used, and the available food supply in the community

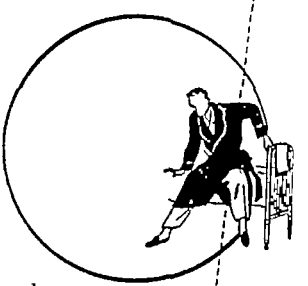
A determination of how much food grown locally is consumed by the family, and how much of the family's eatables are actually produced by themselves

Announce Plans for A M A Interim Meeting

REGISTRATIONS and hotel reservations are now being accepted for the second annual Interim Meeting of the American Medical Association at St Louis, November 30 to noon, December 3, 1948

On the eve of the Interim Meeting, Saturday, November 27, the first national Medical Public Relations Conference will be held under sponsorship of the A M A. at the Statler Hotel

Planned to be especially valuable to the general practitioner, the Interim Session will offer lecture meetings, conducted by medical leaders on conditions most often seen in daily practice Subjects to be discussed include diabetes, heart disease, cancer, poliomyelitis, obstetrics, pediatrics, dermatology, genitourinary conditions, hypertension, anesthesia, tuberculosis, jaundice, laboratory diagnosis, x-ray diagnosis, and physical medicine as applied to the treatment of arthritis



A scientific exhibit with nearly 100 displays will show clinical and pathologic material on subjects dealt with in the clinical conferences, and approximately 115 leading firms will display technical exhibits All exhibits will be open from Tuesday at 8 30 A M to Friday noon, November 30 to December 3

Papers will be read at the General Scientific Meetings in the St Louis Opera House from 9 to 10 A M and from 2 to 3 P M each day At least six demonstration units are planned for each half day in the Scientific Exhibit from 10 30 A.M to 12 NOON, and from 3 30 P M to 5 P M

Officers and members of the House of Delegates will stay at the Statler Hotel Those attending the Medical Public Relations Conference will stay at the Lennox Hotel

A registration form and a convenient blank for making reservations at a number of hotels is appearing in the *Journal of the American Medical Association* every other week until the Interim Meeting All reservations must be cleared through the Chairman, Subcommittee on Hotels, American Medical Association, Hotel Reservation Bureau, 1420 Syndicate Trust Building, St. Louis 1, Missouri, and must be received before November 9, 1948

Plan Meetings on Infant Mortality

IN AN attempt to lower the neonatal death rate and the incidence of stillbirth in New York County, the Special Committee on Infant Mortality of the Medical Society of the County of New York is planning a series of monthly meetings open to all members of the medical and nursing professions and medical students The meetings will be held in Room 441 of the Academy of Medicine Building, 2 East 103rd Street, New York City, on the third Wednesday of every month, at 4 00 P M

Each meeting will open with case presentations of stillbirths or neonatal deaths which, in the opinion of members of the Committee, were preventable Following the case presentations, an outstanding authority in the field will address the meeting and lead discussion of the cases presented Time will be allowed for questions from the floor

The schedule of meetings is as follows

November 17, 1948—"Surgery in the Newborn as a Preventive of Neonatal Death," Dr Edward J Donovan

December 15, 1948—"Prematurity, Its Prevention," Dr Arthur Reich

January 19, 1949—"Prematurity, Its Treatment," Dr Emmett Holt, Jr

February 16, 1949—"Anesthesia and Analgesia During Labor and Its Effect on Neonatal Death," Dr Emery A Rovenstine

March 16, 1949—"Maternal Contagion Causing Congenital Anomalies in the Newborn," Dr Murray H Bass

April 20, 1949—"Resuscitation of the Newborn," Dr Paluel J Flagg

May 18, 1948—"Breech Delivery as a Cause of Neonatal Death," Dr Ralph L Barrett

To Show Display of Radiation Detection Instruments

THE first comprehensive display of radiation detection instruments essential to the industrial, medical, and biologic applications of nuclear energy will be presented at a conference on electronic instrumentation in nucleonics and medicine in New York, November 29 through December 1, according to an announcement by Adrian Dahl, Chief, Radiation Instruments Branch, U S Atomic Energy Commission, Oak Ridge, Tennessee

The exhibit of the U S AEC will include 22 types of basic instruments for radiation detection These instruments, manufactured by 20 commercial companies, are typical of about 125 now in use, including components and others closely related

The purpose of the conference will be to show the unique problems facing the utilization of atomic energy and the need for cooperation and understanding between the electronics engineer, the physical scientist, and the medical doctor In addition to the instrument display the U S AEC is planning to participate with exhibits showing other instrument techniques which will be demonstrated by means of cutaway models

The program will include more than a score of papers presented by leading authorities active in development of various phases of research and development of atomic energy for commercial and scientific application

MEETINGS

FUTURE

American Otorhinologic Society for the Advancement of Plastic and Reconstructive Surgery

The annual meeting of the American Otorhinologic Society for the Advancement of Plastic and Reconstructive Surgery will be held at the Hotel Waldorf-Astoria, New York City, on November 4 A testimonial dinner will be held at 6 00 P M for Dr Samuel Fomon, honorary president Dr Fomon will present the paper of the evening, "Recent Development in Rhinoplastic Surgery Based on New Physiologic Concepts"

New York Academy of Medicine, Salmon Committee on Psychiatry and Mental Hygiene

The Salmon Committee on Psychiatry and Mental Hygiene has announced the sixteenth series of the Thomas William Salmon Lectures to be given by the distinguished Swedish biophysicist and biochemist, Dr Torbjoern Oskar Caspersson, professor of medical cell research and genetics and director of the Institute for Cell Research of the Medical Nobel Institute in Stockholm The series will be presented in Hosack Hall at the New York Academy of Medicine in New York City from November 8 through 10 in the evenings

Under the general title of "Cell Function and Cell Growth in Normal and Pathological Conditions, Studied by Quantitative Cytochemical Procedures," Dr Caspersson will describe his original research at the Karolinska Institute which is a division of the Medical Nobel Institute

PERSONALITIES

Honored

Dr Ludwig Adler, New York City, has been elected honorary fellow of the Societat Medicorum Svecana (Swedish Medical Society) in Stockholm and honorary member of the Gesellschaft der Aerzte in Vienna

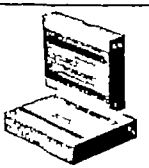
Free flow with

Heparin/ Pitkin Menstruum

'WARNER'



an anticoagulant preparation *with prolonged action for* the prevention and treatment of thromboembolic disorders

HEPARIN/PITKIN MENSTRUUM 'Warner' is a safe and clinically established means of providing prolonged anticoagulation action in the body

One subcutaneous injection of HEPARIN/PITKIN MENSTRUUM Warner is usually sufficient to increase the blood coagulation time for a period of 24 to 48 hours without the necessity for the cumbersome, discomforting and time-consuming procedures usually required when maintaining blood fluidity in thromboembolic disease

Heparin/ Pitkin Menstruum

WARNER'

is available in 200-mg and 300-mg ampuls for subcutaneous injection cartons of 6 ampuls each with or without *vasoconstrictors*

SCIENTIFIC EXHIBITS
1949
ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to the Chairman of the Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss
505 State Tower Building
Syracuse 2, New York

The Annual Meeting will be held May 2 to 6, 1949, at the Hotel Statler in Buffalo

No applications can be considered after January 1, 1949

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P ANDERTON, M D, *Secretary*

To forestall this eventuality

CSC Syrup CHOLINE BICARBONATE

WHEN instituted early and in conjunction with a diet providing large amounts of protein and B complex vitamins, Choline therapy interrupts the chain of events in the development of portal cirrhosis. Thus fatty infiltration of the liver, the forerunner of cirrhosis, is overcome, and the fatal complicating cirrhosis is either forestalled or prevented.

Syrup Choline Bicarbonate C S C, an entirely new choline preparation for therapeutic use, is an advantageous means of administering choline. It is an unusually palatable mixture, provides the equivalent of 12.5 per cent choline base or 14.4 per cent choline chloride, and may be given in full therapeutic dosage without gastric intolerance or nausea.

Available at all pharmacies in one pint bottles.

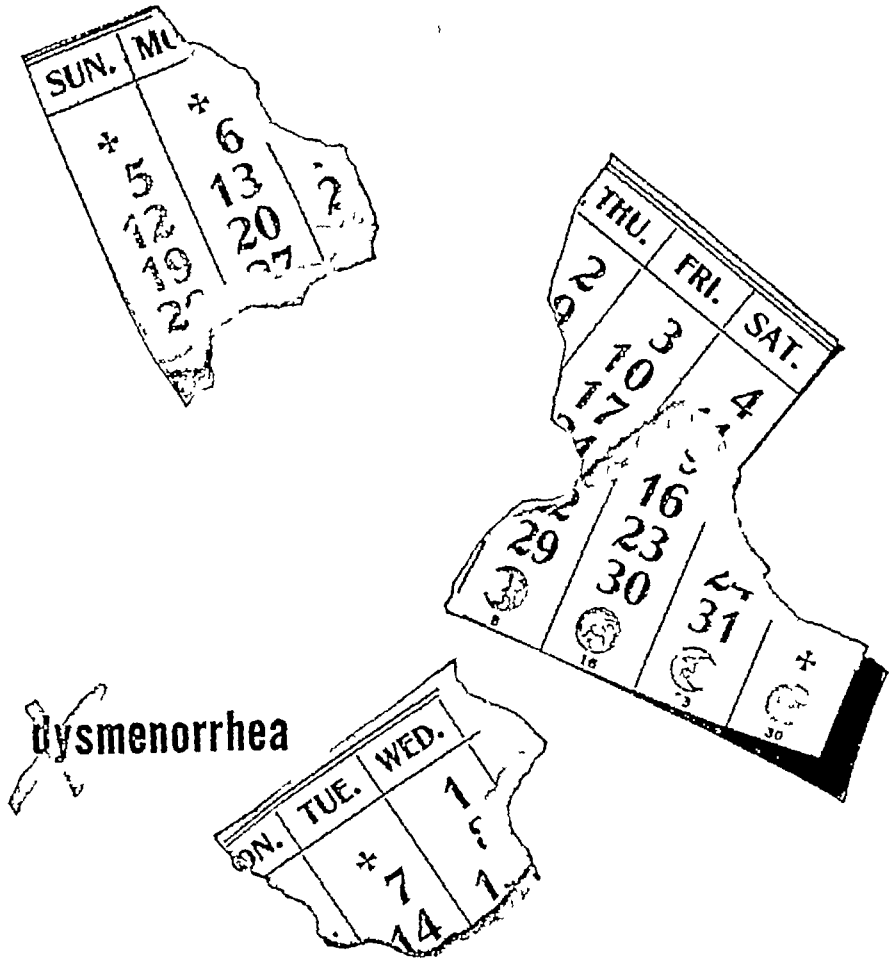
Plastishield technic of aseptic breast care

1 *Protects nipple and areola*

The new Plastishield technic of breast care keeps nipples moist and pliable thus preventing painful fissuring and soreness

2 *Encourages breast feeding*



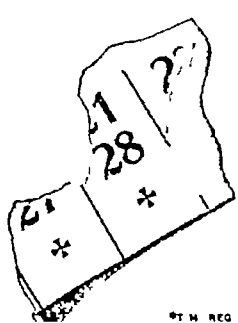
This simple more sterile method of breast care encourages breast feeding by protecting against irritation and eliminating the necessity for ointments and messy medication

3 *Conveniently applied and sterilized*

Plastishields are correctly shaped plastic shields which are easily cleaned and conveniently worn beneath the brassiere or hospital support They minimize leakage and keep nipples everted.

Plastishield, inc.
89 SOUTH TENTH STREET
MINNEAPOLIS 2 MINNESOTA

Plastishield is the Registered Trad ma k of Plastishield Inc.



In a recent study, Long used Edrisal to control dysmenorrhea in 630 factory workers **90% reported relief** Indust Med 15 679

In another study, Hindes used Edrisal for dysmenorrhea in approximately 200 office employees **96% were benefited** Indust Med 15 262

Each Edrisal tablet contains acetylsalicylic acid (2 5 gr) phenacetin (2.5 gr) and Benzedrine* Sulfate (2.5 mg.)

diagnosis: diabetes

TODAY'S newly diagnosed diabetic can live a near normal life Most mild or moderately severe cases can be controlled with *one daily injection* of Wellcome Globin Insulin with Zinc which also allows a higher carbohydrate intake more nearly normal. The intermediate action of Globin Insulin closely parallels physiologic needs maximum activity occurs when the patient is awake and eating, but wanes to minimize nocturnal hypoglycemia

INITIAL DOSAGE AND DIET: One-half hour before breakfast administer 2/3 units of Globin Insulin for every gram of sugar spilled in a 24-hour urine specimen. Or start with 15 units of Globin Insulin and increase dosage every few days

Divide the total carbohydrate allowance (140 to 240 gms.) as 1/5 breakfast 2/5 lunch and 2/5 supper (The total 4/5 lunch supper allowance may be apportioned to fit the patient's requirements.) Midafternoon hypoglycemia may usually be offset by 10 to 20 gms. of carbohydrate between 3 and 4 p m.

FINAL ADJUSTMENT: Both diet and dosage must be adjusted subsequently to meet the individual needs Final carbohydrate distribution may be based on fractional urinalyses Globin Insulin dosage is adjusted to provide 24-hour control as evidenced by a fasting blood sugar level of less than 150 mgm or sugar free urine in fasting sample.

Wellcome Globin Insulin with Zinc is a clear solution comparable to regular insulin in its freedom from allergenic properties Available in 40 and 80 units per cc., vials of 10 cc Accepted by the Council on Pharmacy and Chemistry American Medical Association Developed in The Wellcome Research Laboratories Tuckahoe, New York U S Patent No 2,161 198 LITERATURE ON REQUEST

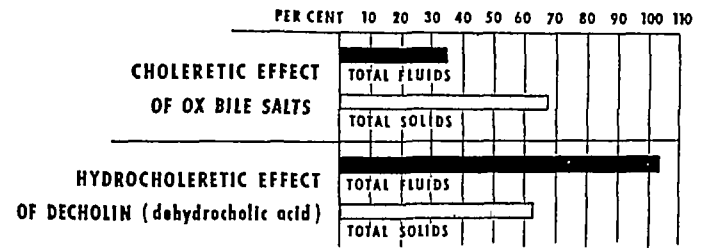
THE SANITARIUM



REST, RELAXATION, MEDICAL CARE

The Sanitarium has all the atmosphere of a fine hotel with individual rooms and tasteful decorations A special feature is made of occupational therapy of all kinds with competent staff and facilities. Other features are large cheerful solarium, billiard room complete gymnasium complete bath and massage department The spacious grounds include a nine-holf golf course All the sanitarium facilities are open to guests who do not wish examination and medical care but come simply for the baths and massages and rest and recreation Modern medical equipment and superb location offer the combined advantages of a medical center and rural Spa

DECHOLIN HYDROCHOLERESIS
Encourages Biliary Tract Drainage

● Percentage Increase in Composition and Quantity of Bile Flow

Ivy A. C., et al. Am. J. Dig. Dis. 7:333 (Aug.) 1940.

HYDROCHOLERESIS—

an increased production of thin liver bile—is a desirable approach to therapy of non-obstructive biliary tract disturbances

DECHOLIN—

by producing an increased flow of bile—washes stagnant, infected bile from the intrahepatic and extrahepatic biliary passages, removing pus-laden material and discouraging the ascent of infection

HOW SUPPLIED *Decholin in 3¾ gr. tablets. Packages of 25, 100, 500 and 1000*

Decholin

ONLY BELLERGAL PROVIDES ALL THREE

1. **SYMPATHETIC INHIBITION with ergotamine tartrate.**
2. **PARASYMPATHETIC INHIBITION with Bellafoline.**
3. **CENTRAL SEDATION with phenobarbital.**

SANDOZ

Originality • Elegance • Perfection

FOR FUNCTIONAL DISORDERS

Patients with psychosomatic disorders suffer somatic distress just as much as those with organic disease

For these patients **Bellergal** provides an effective combination of drugs acting on both divisions of the autonomic nervous system as well as on the central nervous system

Use **Bellergal** in the treatment of gastrointestinal neuroses and other functional disorders

Bellergal

SANDOZ PHARMACEUTICALS
Division of **SANDOZ CHEMICAL WORKS, INC.**

"safety zone"

therapy of

PEPTIC ULCER

The gastric pH range which is safe for the peptic ulcer patient lies between 4 and 5 In this "safety zone' there is neither pepsin activity (which may cause con tinued erosion or bleeding) nor stimulation of excess acid production

Tricreamalate a balanced blend of aluminum hydrox ide gel with magnesium trisilicate reduces acidity within the stomach to pH 4 to 5 Absolute neutrality is not reached Hence there is no stimulus to "acid rebound' and no alkalosis

Through the formation of a protective coating and a mild astringent effect nonabsorbable Tricreamalate is soothing to the irritated gastric mucosa relieves gastric pain and heartburn and aids in healing peptic ulceration as well as in preventing recurrence

Tricreamalate

LIQUID
Bottles of 12 fl. oz.

PROLONGED-ACTION PENICILLIN

ADVANTAGES FOR YOUR PATIENT

- *aqueous* ▸ yet only 1 injection a day
- *aqueous* ▸ minimal pain — no oil—no wax
- *aqueous* ▸ prolonged therapeutic blood levels

ADVANTAGES FOR YOU

- *aqueous* ▸ easily suspended — stable for 21 days under refrigeration or a week at room temperature, with no significant loss of potency. In powder form—stable for a year
- *aqueous* ▸ syringe and needle need not be dry — needle blockage minimized
- *aqueous* ▸ syringe and needle easily cleaned

Crysticillin

Squibb Procaine Penicillin for aqueous injection

a dry powder for the preparation of an aqueous suspension

▸ single-dose vials of 300,000 units with and without diluent
▸ multiple-dose vials of 1,500,000 and 3,000,000 units

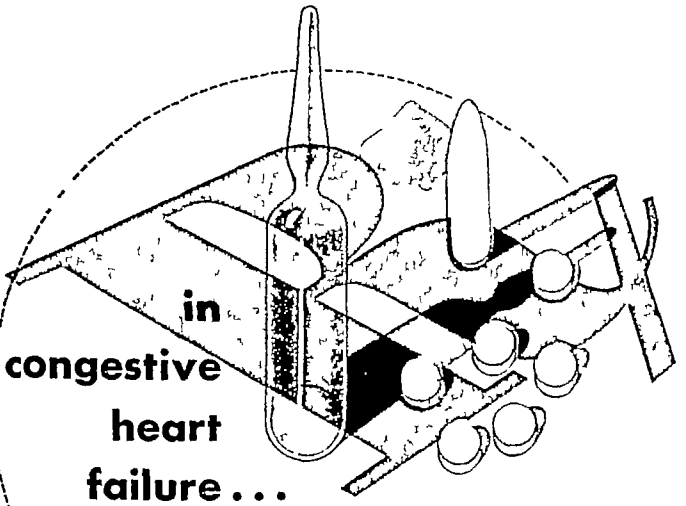
Scorutone
RUTIN with VITAMIN C

For the Control of Increased Capillary Fragility

SCORUTONE is a combination of rutin and ascorbic acid Rutin has been shown to be effective in the treatment of increased capillary fragility Since clinical evidence seems to indicate that it is less effective in the presence of a Vitamin C deficiency, ascorbic acid has been added as a potentiating factor in Scorutone



SCORUTONE tablets are supplied in bottles of 100 tablets, each tablet containing 30 mg of rutin and 50 mg of ascorbic acid Write for detailed information and clinical reports of the successful use of Scorutone to control increased capillary fragility

PIONEERS in Research . . . and Leadership thru the years in combating OTITIS MEDIA

DOHO in realizing the need for a potent, topical, well tolerated ear medication, yet mindful that no one formula could be suitable for all conditions devoted every facility and scientific resource to the development and perfection of AURALGAN and OTOSMO SAN Each has its sphere of usefulness each has been tested and clinically proven in many thousands of cases. *Reprints and substantiating data sent on request*

EACH A SPECIFIC . . . both effective!

Auralgan
IN ACUTE OTITIS MEDIA

is a scientifically prepared, completely water free Glycerol (DOHO) having the highest specific gravity obtainable, containing antipyrine and benzocaine which by its potent decongestant, dehydrating and analgesic action provides effective relief of pain and inflammation

O-TOS-MO-SAN
IN CHRONIC SUPPURATIVE OTITIS MEDIA FURUNCULOSIS AND AURAL DERMATITIS

is not just a mere mixture, but a scientifically potent chemical combination of Sulfathiazole and Urea in AURALGAN Glycerol (DOHO) base which exerts a powerful solvent action on protein matter liquefies and dissolves exuberant granulation tissue, cleanses and deodorizes and tends to exhilarate normal tissue healing in the effective control of chronic suppurative otitis media.

Tarbonis
widely preferred in
Eczema
Psoriasis
Ringworm
Occupational Dermatitis
Folliculitis
Seborrheic Dermatitis
Intertrigo
Pityriasis
Pruritus
Tinea Cruris

In 2¼ oz., 8 oz., 1 lb and 6 lb jars

•

When infection supervenes SUL TARBONIS combines the bacteri cidal properties of sulfathiazole (five per cent) with the virtues of Tarbonis

In many instances, in conditions for which tar therapy is virtually specific, the desired clinical results heretofore could not be obtained because of the side actions engendered by the older tar preparations Not only crude tar but also many so called refined tars prove so intensely irritant that they cannot be applied with sufficient frequency per day nor over the protracted period of time required

Tarbonis has solved this difficulty, without sacrifice of therapeutic efficacy It presents an alcoholic extract of carefully selected crude tars (5 per cent) in a vanishing-type cream Its active ingredient is so highly refined that it is completely nonirritant — it may be safely applied several times daily, as often as every two hours, and as long as required.

In addition, Tarbonis is assured of patient acceptance and cooperation It is free from all tarry odor — leaves no trace upon the skin after application — is greaseless, nonstaining and nonsoiling, to skin as well as linen and clothing — requires no removal before reapplication

TWO PRODUCTS OF OPTIMUM ACCEPTABILITY

OL-VITUM Drops For a highly palatable multi vitamin dietary supplement that is completely dispersible in food or any aqueous fluid Ol Vitum Drops are meeting a gratifyingly high professional acceptance Like all IVC products, they are found to be CLINICALLY ECONOMICAL

Each cc contains

Vitamin A	10,000 USP Units	Vitamin B_6	1 6 milligrams
Vitamin D	2 000 USP Units	Niacin Amide	15 milligrams
Vitamin B	3 milligrams	Natural Mixed Tocopherols	3 milligrams
Vitamin B	0 8 milligrams	(Equivalent to 2 25 milligrams alpha Tocopherol Acetate)	
Vitamin C	100 milligrams		

AD-VITUM Drops In vitamin therapy or dietary supplementation where high potency of the A D combination alone is indicated, Ad Vitum Drops are especially desirable Like its companion product Ad Vitum Drops are palatable will mix with food or any aqueous fluid and again are CLINICALLY ECONOMICAL

Distilled Vitamin A Ester Viosterol in Oil Sorbitan Fatty Acid Ester derivative Vegetable Oil and Glycerin in a flavored *aqueous vehicle*

Each cc contains

Vitamin A
50 000 USP Units

Vitamin D
5 000 USP Units

When Whims and Fancies Obstruct Good Nutrition

Often perverted food attitudes and abnormal outlooks regarding foods and nutrition interfere with adequacy in dietary intake or are responsible for nutritionally improper eating habits Accordingly excessive amounts of foods one sided in nutrient content are consumed or more desirable foods are avoided to the detriment of the nutritional health

When such dietary whims and fancies rule the delicious supplementary food drink, Ovaltine in milk finds special usefulness for readjusting the daily nutrient intake Its bounty of nutrients virtually assures complementation of inadequate dietaries to full allowances of required nutrients Its flavorfulness induces its ready acceptance and continued use

Ovaltine in milk three glassfuls daily supplies the abundance of essential nutrients itemized in the accompanying table Its protein is biologically complete the nutrients dietetically are well proportioned and it is quickly digested and assimilated for meeting metabolic needs

THE WANDER COMPANY, 360 N MICHIGAN AVE CHICAGO 1 ILL

Candy

FOR PRIMING PSYCHOGENIC AND SOMATIC PROCESSES

Although adequate to a nicety meals can readily lose much of their nutritional function unless prepared and served for gustatory appeal Drab meals may be refused denying the patient the benefit of needed nutrients and calories By virtue of variety of form color and flavor candies on the meal tray bring many welcome surprises of satisfaction Their very presence sets psychogenic and somatic processes into operation which are beneficial to appetite digestion and the nutritional state Rich in concentrated caloric energy and superlative in tastefulness morsels of candy may give the needed psychogenic therapeutic impulse to inflect upwards the curve of recovery

Candies are prepared with many valuable foods—milk butter eggs fruits, and nuts To the extent these foods are present candies provide biologically adequate protein appreciable amounts of the important minerals calcium phosphorus and iron and B complex vitamins Thus candies deserve recommendation whenever the clinical situation at hand permits this gustatory and psychogenic treat

LEG ULCERS

the DAXALAN-DOME-PASTE BANDAGE TECHNIQUE

AS INTRODUCED BY DR WILLIAM M. COOPER Director Department of Peripheral Vascular Diseases—New York Polyclinic Medical School and Hospital

This technique is based on a 3 point program—

1. Reduction of dermatitis with wet dressings of DOMEBORO TABS (BUROW S SOLUTION)
2. Combat local infection and stimulate healing with thick application of DAXALAN in the center of the ulcer and surrounding areas.
3. Overcome venous insufficiency stasis and edema by wrapping DOME PASTE BANDAGE around the entire leg to supply compression

DOCTOR! You may now prescribe SOOTHING Modernized Simplified Fresh and Stable BUROW'S SOLUTION 1 20 in four forms DOMEBORO Tablets Packets Powder Ointment

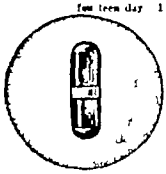
DOME CHEMICALS INC. 250 EAST 43rd STREET NEW YORK 17 N Y
Makers of the Soothing Modernized Form of Burow's Solution
DOMEBORO —Tablets Powder Packets Ointment

Daxalan is our trademark for a rigidly standardized whole crude tar paste (low in naphthalene content) uniform in color free of coal tar specks and aged for six months

Dome Paste bandage is a flesh colored 4" x 10 yd. gauze bandage impregnated with a modified "Unna's Formula" consisting of zinc oxid. glycerin. gelatine and calamin. This Unna's Boot comes to you in a soft condition and is ready for instant use.



foster recovery with

TAKA-COMBEX® KAPSEALS®

TAKA COMBEX Kapseals assist in correcting faulty starch digestion and in restoring favorable balance of the water soluble vitamins. The recommended dosage supplies B vitamins and vitamin C in amounts which may prevent deficiencies arising from states of medical and surgical stress. TAKA-DIASTASE® – potent starch-converting ferment – compensates for amylolytic enzyme deficiency and relieves distension eructation and other discomforts of impaired starch digestion.

TAKA COMBEX Kapseals provide a valuable prophylactic and therapeutic measure for those on restricted or inadequate diets for convalescents for elderly patients for those with increased metabolic requirements – as in hyperthyroidism in febrile illness and in pregnancy or during lactation.

DOSAGE: Initially 2 Kapseals three times daily before meals; after ten to fourteen days 1 Kapseal three times daily.

Each TAKA COMBEX Kapseal Contains

Taka-Diastase	3½ gr.
Vitamin B_1 (Thiamine Hydrochloride)	3 mg.
Vitamin B_2 (Riboflavin)	2 mg.
Vitamin B_6 (Pyridoxine Hydrochloride)	0.5 mg.
Pantothenic Acid (Sodium salt)	2 mg.
Nicotinamide (Niacinamide)	10 mg.
Vitamin C (Ascorbic Acid)	30 mg.

With other components of the Vitamin B Complex derived from Brewers Yeast.

PACKAGE INFORMATION: Available in bottles of 100 and 1000.

WESTWOOD PHARMACEUTICALS Dept. H Y. 468 Dewitt St., Buffalo 13 N Y
division of Foster Milburn Co

In conditions of faulty body mechanics, the nonuse of the abdominal muscles allows the pelvis to rotate downward and forward, bringing the sacrum up and back. There results an increased forward lumbar curve with the articular facets of the lumbar spine crowded together in the back.

The dorsal spine curves backward with compression of the dorsal intervertebral discs and the cervical spine curves forward with the articular facets in this region closer together. Therefore, chronic strain of the muscles, ligaments and joints of the spine and pelvis occurs.

Camp Anatomical Supports have an adjustment by means of which their lower sections can be evenly and accurately brought about the major portion of the bony pelvis. When the pelvis is thus steadied, the patient can contract the abdominal muscles with ease and then with slight movement straighten the upper back.

Relieving back strain and fatigue due to faulty body mechanics is a feature of the Camp Support illustrated and other types for Prenatal, Postnatal, Postoperative, Pendulous Abdomen, Visceroptosis, Nephroptosis, Hernia and Orthopedic conditions

Findings from the Saratoga Spa records*

CARBON DIOXIDE BATHS in circulatory diseases

The physiological observations of the influence of carbon dioxide baths show a decrease in the pulse rate, an increase in the pulse pressure dependent mainly on a drop of the diastolic pressure, a better emptying of the venous blood vessels a hyperemia with increased capillary circulation, a slightly elevated minute volume output of the heart, an increase in respiration and the elimination of large quantities of the carbon dioxide through the lungs

In evaluating the results of this treatment for patients with circulatory disorders there is no ideal test of cardiac function and in these patients the ability to walk or exercise without the production of symptoms is used in judging their clinical gain In addition, in the patients with coronary disease suffering from anginal attacks, it is striking to note the decrease in the frequency and severity of these attacks In some patients they will disappear completely

Objective changes as seen in physical examination and in the studies of pulse rate, blood pressure, roentgen ray findings, electrocardiographic tracings, and vital capacity are noted in many patients

The clinical improvement of many patients undergoing treatment, their continued well being after their return home and their desire periodically to return for further treatment all indicate that the carbon dioxide bath has its place in the treatment of disorders of the circulation

*As printed in International Clinics Vol. 1 page 199 March 1937

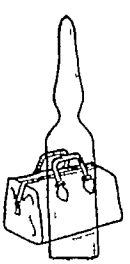
a diuretic of choice



"The mercurials are so often effective that other diuretics are being used less and less This is especially true of the formerly popular xanthin derivatives [which] often fail"[1]

"During the past decade or so mercury diuretics have come into use and to a large extent are superseding those just mentioned [theophylline, theobromine sodium salicylate aminophyllin]"[2]

"In recent years the xanthine derivatives have been used but seldom as diuretics as a result of the introduction of the more effective mercurial diuretics."[3]

MERCUHYDRIN®

well tolerated locally, a diuretic of choice

embodies the merits which have led to the concurrence of authoritative opinion on mercurials in modern diuretic therapy Mobilization of water binding sodium withdrawal of edema fluid and increase of urine volume check tissue inundation as shown in a recent study with radioactive sodium and MERCUHYDRIN[4]

Clinical efficacy is augmented by suitability for intramuscular injection.[5] The convenience and safety[6] of this mode of administration facilitate the recommended frequent dosage schedules[8] of modern diuretic therapy

MERCUHYDRIN (mersalluride sodium solution) is available in 1 cc. and 2 cc. ampuls.

Hazards of X-Rays

The *Journal of the American Medical Association* in a recent issue voices timely warning of the hazards of x-rays.[1] Although long in use, these rays, carefully studied since the time of Roentgen, have achieved wider applicability in medicine both for diagnostic and therapeutic purposes through the years Hazards have increased with greater power output of tube generators and more general use of this type of radiation Says the *Journal*

Roentgen rays for diagnosis (films and fluoroscopy) are safe only because radiologists have a long tradition of being careful, and because films and screens are so sensitive as to require rather small exposures. Examples of accidental erythema or redness continue to appear and even of disastrous roentgen ulceration. Any of these come from fluoroscopy for bone setting and for removing foreign bodies. The hazard seems higher among surgeons and general practitioners than among x ray specialists Paradoxically the smaller types of x ray machines have provided most of the worst cases Every radiologist has a collection of anecdotes to show how dangerous roentgen rays can be in the hands of those not specially trained

In treating cancer big doses of radiation are used Resulting damage to skin and normal structures is severe and obvious Blistering is often only the proof that a thoughtful and conscientious therapist has given enough radiation to have a chance to cure. Such damage including the possibility of late roentgen ulceration or late roentgen cancer, is not too high a price to pay for cure of a cancer, regrettable, but at present necessary Perhaps new medical discoveries regarding cancer will outmode the present radiation therapy

Familiarity with any medium unfortunately may breed contempt in some instances especially when the familiarity may be putative rather than actual The warning against x-ray hazards as expressed by the *J.A.M.A.* is the more necessary and important for this reason

Even small quantities of roentgen or radium rays can prove damaging. Radiation injury to the skin sometimes leads to cancer coming even many years after Some of these patients did

[1] 138:214 (Sept. 18) 1948.

not show immediate injury, even so much as redness of the skin Repeated or continuous irradiation of the whole body can produce aplastic anemia, sometimes leukemia, even when the individual doses have been moderate

Now we stand on the threshold of a new era—the atomic age, with many new modalities and kinds of radiation available for research and therapy If the hazards of the old apparatus are not as yet fully appreciated, with all the experience the profession has had with it and with radium, one hesitates to consider the potential hazards in the use of radioactive isotopes on a large scale Continual education of the profession to combat the use of the newer modalities by the partly informed is highly necessary The Medical Society of the State of New York through its Council Committee on Health and Education is already undertaking this task so essential to the interest of both profession and public

Current Editorial Comment

Radiologic Warfare Atomic medicine for doctors is now being taught at the University of California [1] Dr Stafford Warren, formerly head of the radiology section of the Atomic Bomb Project, has inaugurated, as dean of the Medical School, a special three-week seminar in atomic medicine Addressing a large group of private physicians, local, state, and federal public health officers and U S Army and Veterans Administration doctors attending the Seminar,

> Dr Warren said that in a war emergency "groups like this will have to be the nucleus of any defensive or protective organization that is set up"
>
> Atomic fission, he said, had given rise to a new science of "nonstatic biology" calling for revised concepts if man was to cope adequately with the perils of atomic warfare and to exploit radiology
>
> Dr Warren depicted the new field as involving to a great degree relativity rather than the absolutes with which scientists were accustomed to deal
>
> Noting that the physicists, chemists, and engineers with whom atomic fission originated "think in terms of a small percentage error because they deal with fixed conditions," Dr Warren, who is one of the nation's leading authorities in atomic medicine, said that the application of fission to medicine, human beings, and the whole field of biology created a great new area where quantities were not static and precise, but dynamic and constantly changing
>
> "The human body," he said, "is like an engine going at a moderate speed, and you have to pick off your sampling while the engine's running If you stop the machine, you get an abnormal result
>
> "This concept of nonstatic conditions of biologic materials is largely new It's crept up on us
>
> "This is where we have the greatest lack today, nationally and internationally, as concerns the study of radioactivity in warfare and large-scale contaminations
>
> "You can't just say you'll have so many microcuries (radiation units) spread in a certain area uniformly There is no such thing as uniformity on such a large scale"
>
> In illustration, he cited the recent revelation through experiment with radioactive sodium in humans that bones were not, as traditionally regarded, merely static structural members of the body, but "constantly fluctuating chemical storehouses," containing as much as 20 per cent of the body's salt reserve and pouring out and absorbing chemicals in "tides" according to bodily demand
>
> "If you don't have this concept of change, your findings will be entirely unexplainable or confusing," Dr Warren said
>
> "In experiments with radioactive substances," he added, "it's not enough just to establish the existence of a concentration They don't mean much by themselves It's only in relation to other concentrations in the body that they have significance"

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Examples of Biochemical Interrelationships Among Nutrients

One of the most fascinating chapters in the science of nutrition is being unfolded by biochemists who are investigating the mechanisms by which the essential nutrients perform their functions in living organisms This new knowledge is not only of fundamental interest to nutritionists, but it also furnishes a rational basis for the quantitative interrelationships of nutrients, and it ultimately will provide methods for evaluating nutritional status With clarification of the biochemical functions of the nutrients, the interrelationship between the various essentials has become increasingly evident. It is the purpose of this brief article to point out examples of these interrelationships and to indicate their importance in nutrition

For example, iron is an indispensable nutrient It is a necessary constituent of hemoglobin as well as a number of oxidation-reduction enzyme systems essential for the life of cells. Some of these are catalase, peroxidase, the cytochromes, and cytochrome oxidase However, in order for the body to convert the iron to hemoglobin, another indispensable dietary nutrient must be present, namely, copper Hemoglobin is a conjugated protein and is a complex compound composed of hemo, iron protoporphyrin, and globin All of the indispensable amino acids which comprise the globin molecule must be provided by dietary protein Add to the foregoing the role of folic acid in stimulating the hematopoietic system, and one arrives at the point where the interrelationships of various dietary essentials have ceased to be of interest solely as academic pursuits but are of immense value in preventive as well as clinical medicine.

Let us consider another example The primary function of both carbohydrates and fats in the diet appears to be their value as a source of calories In the breakdown of these nutrients to their end products of carbon dioxide and water, the energy locked in the original carbohydrate and fat molecules is liberated for use in biochemical reactions and eventually appears as heat Thiamin is necessary for the complete utilization of carbohydrate but not of fat. In fact, increasing the proportion of fat to carbohydrate calories in the diet spares or reduces the requirements of thiamin The latter, in combination with phosphoric acid, functions as a coenzyme for the oxidation of pyruvic acid, an intermediate product in the breakdown of carbohydrate. In the absence of thiamin, the splitting of carbohydrate stops at the pyruvic acid state, and this acid accumulates in the tissues If the accumulation is prolonged, signs and symptoms of thiamin deficiency appear Knowledge of the function of thiamin has helped to explain the paradox of why the average Oriental diet containing approximately the equivalent in thiamin to that of the average Occidental diet still does not prevent a high incidence of beriberi At least a partial explanation is that the Eastern diet contains a higher proportion of calories in carbohydrates than does the Western diet, and, therefore, it requires more thiamin for its utilization.

Although thiamin appears to be primarily concerned with the utilization of carbohydrate, other members of the vitamin B complex are necessary for the utilization of energy derived from carbohydrates. These same vitamins are required for the metabolism of fat and protein Specifically, niacin and riboflavin are known to function as constituents of coenzymes which serve as hydrogen transport agents. In the metabolism of the major foodstuffs, the hydrogen

in the molecules is stripped off and carried by a series of oxidation-reduction enzyme reactions to eventual combination with oxygen, to form water Niacin and riboflavin, as well as iron and amino acids, are nutrient essentials which are indispensable components of this hydrogen transport and energy producing system

It is interesting to note in this connection that ariboflavinosis and pellagra are commonly seen together as multiple deficiencies, particularly in humans, a species requiring exogenous sources of both riboflavin and niacin Furthermore, the long known relationship between protein and pellagra has recently been clarified by the findings that the essential amino acid, tryptophane, serves as a precursor of niacin synthesis Thus, it is possible to explain why diets high in corn in southern areas of this country may lead to pellagra although they contain as much niacin as the diets in other areas where pellagra is not endemic Corn protein is deficient in the amino acid tryptophane People depending on corn protein not only have a niacin deficiency but lack the necessary precursor found in diets containing higher quality protein

These few examples illustrate the mechanisms by which various nutrients function in biochemical reactions necessary for cell life They also explain why a diet to be complete must furnish a variety of nutrients An understanding of these mechanisms is essential for sound agricultural planning and for public health promotion through nutrition The former is concerned with the production of necessary nutrients in our nation's food supply, the latter with the proper and efficient use of these nutrients

SCIENTIFIC EXHIBITS
1949
ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to the Chairman of the Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss
505 State Tower Building
Syracuse 2, New York

The Annual Meeting will be held May 2 to 6, 1949, at the Hotel Statler in Buffalo

No applications can be considered after January 1, 1949

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P Anderton, M D , *Secretary*

Scientific Articles

SPHENOPALATINE GANGLION BLOCK FOR THE RELIEF OF PAINFUL VASCULAR AND MUSCULAR SPASM WITH SPECIAL REFERENCE TO LUMBOSACRAL PAIN

J Lewis Amster M D F I C A New York City

(From the Morrisania City and Bronx Hospitals and the Bronx Eye and Ear Infirmary)

HAVING practiced general surgery for many years and having previously practiced in the field of anesthesia I have always been intensely interested in the development and advancement of general and regional anesthesiology and therapeutic nerve block. At the outset I wish to emphasize that I do not claim to be an anatomist or a physiologist nor am I a neurologist or a nose and throat specialist This paper is based on three years personal clinical experience with the use of sphenopalatine ganglion block for the relief of painful muscular and vascular spasm with special reference to lumbosacral and sacroiliac pain

The conquest of pain is of vital importance. For many years sedatives and narcotics were our principal weapons against intractable pain More recently, we have fought pain due to spasm with new implements namely therapeutic nerve block and sympathetic nerve operations [1] The pathways of pain have been explored and studied new local anesthetic agents have been discovered and new technics for their administration have been devised [1] These new procedures are founded on a firm neuro-anatomic and physiologic basis and have been accepted as ideal therapeutic measures for the relief of many painful muscular and vasospastic disorders

The alleviation of pain, from a surgical point of view, was advocated and practiced by Rene LeRiche during the first World War [2] His pioneer work with therapeutic nerve block and surgery of the sympathetics led others to use his procedure in the treatment of painful conditions following war wounds In his writings he emphasizes the important part played by the autonomic nervous system in the production of pain due to muscular and vasospastic disorders

Labat followed in the footsteps of LeRiche when he recommended therapeutic nerve block and ganglionic nerve block for the relief of pain [3] Although many outstanding anatomists physiologists, and neurologists were unwilling to accept the views expressed by these pioneers LeRiche and Labat continued their work unconcerned and undismayed

In time LeRiche abandoned infiltration of peripheral nerves and peripheral neurotomies and adopted sympathetic ganglion infiltrations and operations on the sympathetic ganglia for the majority of painful spastic conditions He was convinced that a certain kind of pain apparently due to vasoconstriction, originated in the sympathetics The fact that operations on the sympathetics caused this pain to disappear confirmed his opinion. Thirty years ago it was generally believed that the sympathetic was a purely motor nerve. Physiologists held that the sympathetics had no centripetal fibers and that they did not have the faculty of forming a reflex arc LeRiche and Bruecker came to the conclusion that the sympathetics do have certain centripetal elements in that they could form reflex arcs and could be the starting points of painful phenomena [1]

When we speak of the autonomic nervous system our attention is usually directed to the sympathetic trunks We apparently overlook the four cephalic sympathetic ganglia the sphenopalatine ciliary otic and submaxillary

The sphenopalatine or Meckel's ganglion sometimes spoken of as the sphenomaxillary or nasal ganglion is a small triangular body about 5 mm. in diameter It is situated in the upper portion of the sphenopalatine fossa just beneath the superior maxillary or the second division of the fifth nerve It receives the following branches

Sensory Roots Two from the superior maxillary division of the fifth nerve

Motor Root Probably derived from the

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Anesthesiology May 19 1948.

nervus intermedius through the great superficial petrosal nerve and is supposed to consist, in part, of sympathetic efferent fibers from the medulla In the sphenopalatine ganglia, these fibers form synapses with neurons whose postganglionic axons, vasodilator and secretory fibers are distributed with deep branches of the trigeminal to the mucous membrane of the nose, soft palate, tonsils, uvula, roof of mouth, upper lips and gums, and upper part of the pharynx.

Sympathetic Root Derived from the carotid plexus through the deep petrosal nerve These two nerves join to form the nerve of the pterygoid canal Vidian before their entrance into the ganglion [4]

The sphenopalatine obviously belongs to the series of sympathetic nodes and is connected with the superior cervical ganglion, thus making it part of the sympathetic ganglion chain (Fig 1) Interruption of the sphenopalatine ganglion may be produced by anesthetizing or destroying the ganglion through three different approaches (1) the lateral or zygomatic route (2) the inferior or palatine route, and (3) the anterior or intranasal route

Sluder was probably one of the first to recognize the anesthetic value of sphenopalatine block for the relief of intractable pain, but little attention was paid to this discovery until Ruskin began his

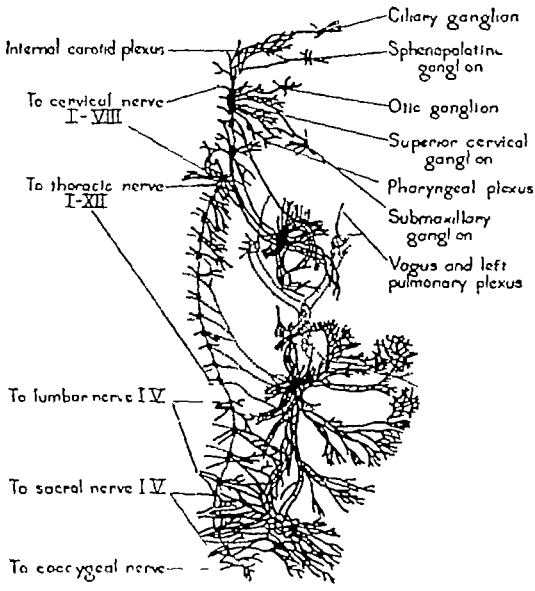

FIG 1 Diagram of the sympathetic nervous system The dotted lines indicate the branches of the cerebrospinal nerves which join the sympathetic system and those sympathetic nerves which are composed in major part of fibers from the cerebrospinal nerves

(Reprinted from Ranson, Stephen W The Anatomy of the Nervous System, Philadelphia, W B Saunders Co , 1936)

experimental and clinical work along these lines [5 6] To him belongs the credit for rediscovering and reviving the neglected treatment

Captain Neuberger of the United States Navy has advocated the destruction of the sphenopalatine ganglion by electrocoagulation for the relief of hay fever [4] Ruskin reported the use of alcohol injections for the purpose of destroying the ganglion and relieving pain [5] He later recommended the topical application of cocaine over the area of the sphenopalatine ganglion through the nasal route for the control of painful vascular and muscle spasm The destruction of the ganglion with alcohol or electrocoagulation is not an entirely simple procedure, and there is some danger that it may produce sloughing, hemorrhage, or damage to the olfactory nerve The results of topical application of an anesthetic agent through the anterior or intranasal route are very striking, and the simplicity of this method, combined with its safety, the spontaneous relief of pain, and the absence of any toxic reactions, together with the economy of treatment, have earned for sphenopalatine block the name of an unbelievable therapeutic ganglion block

At a meeting of the American Society of Regional Anesthesia in 1935, Kuntz read a paper on *"The Anatomical and Physiological Basis of Nerve Blocking and Regional Anesthesia with Reference to Autonomic Nerves"* [7] In the course of the discussion, Dr Kuntz was asked if he could offer an explanation for the successful relief of lumbar pain, lumbago, which the discussant was able to relieve by sphenopalatine anesthesia, and whether there was a known pathway that would explain a distribution lower than the first thoracic Dr Kuntz's reply was as follows "The relief of the lumbar pain by anesthetizing the sphenopalatine ganglion is a remarkable thing I suppose it might have been a pelvic pain or any other No nerve connection can be pointed out by which that could be explained, but I have heard of it before Pain as low down as the lumbar region seems to have been relieved by anesthesia of the sphenopalatine ganglion I am sure we have no explanation for that at present"

Etiology

In reviewing the literature on painful muscular spasm, we note many suggestions concerning the cause of the condition, such as infection, fatigue, anoxia, toxic factors, neuritis, vitamin and chemical deficiencies, psychosomatic factors, trauma, overactivity of the autonomic nervous system, etc I fully agree with Gold that the contraction of muscle per se does not always cause pain and that when pain occurs in association with muscular contraction or spasm it is due to ischemia

resulting from prolonged spasm or abnormal pulls, tensions, or distortions of muscles with stretching or tearing of muscle fibers [8]

The cause of this painful condition is rather mysterious. Often it comes on like a thunderbolt from a clear sky without any history of trauma. Psychosomatic factors should not be overlooked These influences act through the vasomotor nerves that supply the blood vessels of the affected spastic muscles Stress and strain, fear and apprehension, cares and worries, unbalanced hormone activity, and metabolic changes are said to be causative factors The role of the adrenals, parathyroid, thyroid, pituitary, and other ductless glands must not be ignored The rapid reduction or depletion of the body's supply of calcium has something to do with muscular excitability and pain Vitamin deficiencies may also be underestimated

Sphenopalatine ganglion block was brought to my attention many years ago, and I confess that at that time I failed to recognize its value in the treatment of painful muscular and vascular spasm For thirty five years I was the victim of recurrent lumbosacral pain. These acute attacks occurred about once a year and lasted a week or ten days and sometimes longer I wore a heavy bulky sacroiliac brace during most of that time and tried every known form of treatment with little relief My last attack occurred on February 25, 1945, just as I completed a lengthy rectal operation As I rose from a sitting position, I suddenly felt excruciating pain in the left lumbosacral region. Sphenopalatine ganglion block was suggested, but at that time I could not understand the rationale of the treatment The pain became progressively worse, and I finally went to Dr Ruskin for treatment He blocked both sphenopalatine ganglia with a topical application of a local anesthetic, and the pain disappeared almost completely within twenty minutes Another block was given the next day and a third the day after The pain vanished entirely, and I was able to resume my practice. The relief obtained was really dramatic, and at the end of three years there has been no recurrence of pain My personal experience convinced me that this method is a promising new approach to the treatment of many spastic disorders However it is not a universal panacea, and no assurance of relief should be made if the painful spasm has an underlying organic cause

Procedure

Sphenopalatine ganglion block consists of a simple topical anesthetization of the sphenopalatine ganglion through the nasal route as follows (Fig 2) The tips of four fine flexible copper applicators or probes are covered with small bits of

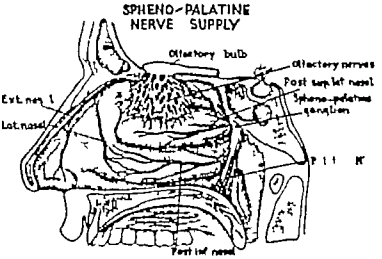

FIG 2 Nerve supply of the nasal cavity

cotton and dipped into the anesthetic solution A nasal speculum is inserted and the nasal cavity illuminated and carefully visualized (Fig 3) A cotton tipped applicator is passed along the upper border of the inferior turbinate bone and directed backward and downward until the upper posterior wall of the pharynx is reached Another applicator is directed along the upper border of the middle turbinate bone until the tip comes in contact with the body of the sphenoid bone about 1/4 inch external to the nasal septum (Fig 4) The same procedure is carried out on the opposite side. The four applicators are left in place for thirty minutes and then removed The applicators should never be forced into the nares as rough handling may damage the mucous membrane and cause pain

Case Reports

My series included a number of physicians who were treated and thus were in a position to evaluate the treatment They reported a sense of calm and relaxation with a sudden relief of spasm and pain The coughing test was painless in the lumbosacral cases Some of our patients complained of tenderness over the lower lumbar region resulting from prolonged spasm after the

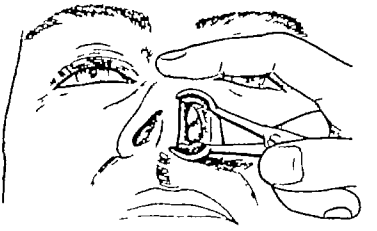

FIG 3 Nasal speculum in situ exposing middle and inferior turbinates.

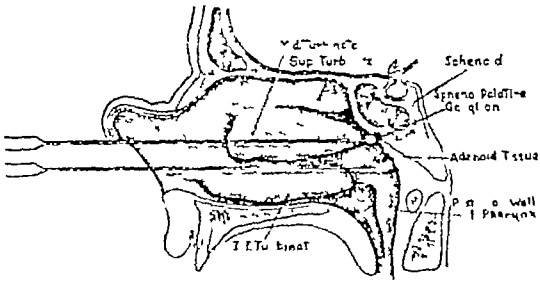

FIG 4. Anesthesia applied topically to sphenopalatine ganglion and posterior wall of pharynx.

conventional orthopedic treatment This myositis was greatly relieved by medication consisting of 2 grains calcium gluconate, 1½ grains papaverine, 5 grains novaspirin, and ½ grain caffein citrate in capsules (one capsule three times a day after meals), until muscular tenderness disappeared

The following is a brief description of a few outstanding cases

Case 1 —A. C , a man of fifty-four, suffered from persistent hiccough The patient had been seized with pain in the right loin radiating downward and forward, frequent and urgent urination, and dysuria A calculus was found blocking the right ureter which caused an acute hydronephrosis with pressure on the diaphragm The calculus was dislodged by Dr Greenberger Thereafter, the patient hiccoughed persistently for twelve days, and every known remedy, including blocking of the phrenic nerve, had been tried I blocked the sphenopalatine ganglia by topical application of 2 per cent pontocaine three times, at intervals of twenty-four hours After the third block, hiccoughing was completely controlled, and there was no recurrence

Case 2 —A. W , a forty-two-year old man, came to me with complaints of lumbosacral pain The patient, a physician, had suddenly felt severe pain in the lumbosacral region about ten days prior to his visit. He had been examined by an orthopedist, a neurologist, and a neurosurgeon, who attributed the pain to herniation of the third and fourth lumbar disks The routine palliative orthopedic treatment gave no relief, and operation was suggested When he came to me to seek relief from pain, he was actually carried into my office I told him that his case was not suitable for ganglionic block and that I was reluctant to attempt it. Finally, with the consent of the orthopedist and neurologist I agreed to treat him. The sphenopalatine ganglia were blocked with a 2 per cent pontocaine solution, and at the end of thirty minutes the patient was free from pain The following day he was able to take care of two obstetric cases and felt much better Pain did not recur until approximately two years after the first attack.

The second attack occurred while he was on vacation, and there was no history of trauma. It was much more severe than the first attack, the pain was so intense that he had to be lifted onto the treatment table The sphenopalatines were blocked as usual with a topical application of 2 per cent pontocaine Pain was relieved, and he went on a fishing trip the next day There has been no further recurrence

Case 3 —D L was a girl of twelve years suffering from acute torticollis On awaking one morning, the child complained of severe pain and muscular spasm over the right side of the neck She was immediately referred to me for treatment

She was in agony, with her head fixed to the right shoulder There was a stony hard contraction of the sternocleidomastoid muscle, and she could not move her head in any direction

A 2 per cent nupercaine solution was applied to the sphenopalatine gangha, and in less than half an hour the spastic pain was entirely relieved She left the office smiling and happy and has had no recurrence

Case 4 —I F , a man of fifty-five, was referred to me for treatment of herpes zoster, fifth and sixth right intercostal nerves This patient had been under a physician's care for approximately two weeks All the modern forms of therapy, including pituitrin, had been tried without success He complained of terrific pain over the right side of the chest and had a rash along the fifth and sixth intercostal nerves which was tender to the touch

Monocaine 2 per cent was applied to the sphenopalatine gangha, and within twenty-five minutes the pain was greatly reduced A second block was done the next day and a third and final block forty-eight hours later Complete relief of pain followed He was discharged happy and comfortable and resumed his usual work

Results In 103 Cases

My clinical experience with ganglionic block dates from March 1, 1945 Since then I have treated 103 patients (54 women and 49 men) between the ages of six and seventy-eight for various conditions (Table 1) This series seems sufficiently extensive to evaluate the therapeutic worth of the procedure

TABLE 1 —CONDITIONS TREATED WITH GANGLIONIC BLOCK

Condition	Number of Cases
Migraine	4
Acute torticollis	2
Painful spastic shoulder (subdeltoid and subacromial bursitis)	12
Intercostal neuritis	2
Herpes zoster	3
Persistent hiccough	4
Ureteral colic	5
Dysmenorrhea	3
Peripheral painful vascular spasm	7
Lumbosacral and sacroiliac pain	61
Total	103

In the 103 cases the treatment was used 327 times without any significant toxic reactions Those reported elsewhere were probably due to the use of some toxic anesthetic agent I have used various anesthetic agents, such as cocaine,

nupercaine, pontocaine, monocaine, etc, all of which, with the exception of cocaine, were found to be suitable Since two patients reacted poorly to cocaine, its use has been discontinued

Relief of pain and spasm was noted in approximately 90 per cent of my cases In the remaining 10 per cent some underlying organic condition was apparently responsible for the failure. In some cases the spontaneous relief of pain was really spectacular Immediate cessation of pain and spasm often occurred after the administration of one block In patients who were treated shortly after the onset of their symptoms In the early cases of lumbosacral pain there was a definite increase in the range of active and passive motion within thirty minutes after treatment Many sacroiliac patients who had been unable to turn from side to side in bed had less difficulty in rising or lying down

When the symptoms were far advanced and after the unsuccessful use of conventional orthopedic measures and physical therapy, the reaction was less dramatic Repeated ganglionic blocks were necessary, and convalescence was less rapid. In other words, the shorter the duration of the condition, the more rapid was the response. The majority of failures occurred in the advanced lumbosacral cases with complicating pathologic conditions.

These dramatic reports of the results of treatment by sphenopalatine block may sound fantastic, but they are true. The old saying "seeing is believing" still holds and these results must be witnessed in order to realize the full extent of the beneficial effects of this anesthetic procedure.

1882 GRAND CONCOURSE

Discussion

Simon L. Ruskin M D *New York City (Read by Jacob Brauower, M D)* —This marks the twenty fifth anniversary of my use of this procedure That quarter of a century has marked a rather stony path full of criticism from those who could not see a relationship between the autonomic center in the nose and muscle spasm. They were apparently not aware of the fact that the autonomic nervous system is a diffusely acting one and that an influence on any one of the major centers influences the entire autonomic system

The basic fact that the treatment actually did relieve the pain of muscle spasm did not seem to impress the physicians generally They seemed more interested in getting an explanation than a therapy Many of our therapeutic procedures today are still vaguely understood as to their mode of action and yet are in continuous and successful use. A great deal of mystery still surrounds the mode of action of sulfa drugs and penicillin but that has not withheld their wide application.

During the many years that I have used the sphenopalatine ganglion therapy a great deal has been learned regarding the pharmacology of the sympathetic, some of which I have described in my article, *The Control of Muscle Spasm and Arthritic Pain Through Sympathetic Block at the Nasal Ganglion and the Use of Adenylic Nucleotide* * I have learned to use a large number of alkaloids, as well as the various anesthetic agents One of the most useful has been atropine and among the local anesthetic agents a good deal of selectivity has to be exercised, depending upon the type of patient and the severity of the disturbance.

A number of years were also spent in studying the biochemical aspects of muscle spasm and in this work *the following basic things were discovered*

First a muscle in spasm is in the energy poor state and supplying a source for muscle energy speeds the recovery This can be accomplished speedily through the intramuscular injection of the adenylic nucleotide preferably as the iron salt and for this I use the preparation Irony!

Second to facilitate the conversion of carbohydrate to energy I use the coenzymes of the B complex, rather than the synthetic B complex preparations In the form of the preparation, Co-Amino which has the coenzymes of the B complex and the amino acids.

Third I use the sphenopalatine ganglion block which reduces the rate of nerve impulses to the spastic muscle and increases the mechanical efficiency of the muscle. The influences on the sympathetic can also be enhanced by the intramuscular injection of calcium ascorbate Calcorbate which I have found much more effective than calcium gluconate.

I avoid all of the sedatives since they diminish the oxidation capacity of the blood and prolong the duration of illness. I also do not give any aspirin Where there has been prolonged chronic infection I prescribe the iron ascorbate Ferro-C one tablet three times a day to increase the oxidation-reduction properties of the blood and facilitate the energy exchange. These suggestions have proved their value over a series of many years and are eminently worthwhile

M J Madonick, M D, Bronx —When a new treatment is introduced it is essential that all diagnoses be established as definitely as possible Pain in the lumbosacral and sacroiliac regions is of frequent occurrence but its cause is not easy to determine The diagnosis of lumbosacral and sacroiliac strain although often made is not too clear a concept to me Perhaps some of these cases are really instances of protruded intervertebral disks The relief of pain in the patient with a protruded disk described by Dr Amster is significant. However many more such patients would have to be treated to exclude chance improvement, since spontaneous remissions in protruded disks as well as in other radiculitides, occur fairly often Another factor to consider in pain is the psychologic one. There are tremendous differences in the threshold of pain in different individuals and also in their responses to therapy A series of cases with back

* Am. J Digest Dis (Oct.) 1946

pains on a conversion hysteria basis should have infiltrations of the sphenopalatine ganglion to determine how they respond to this form of treatment and whether this type of thrapy acts suggestively

It would be interesting to follow the cases presented by Dr Amster to find out whether they have recurrences and, if so, whether they would again respond to sphenopalatine ganglion infiltration or topical anesthetization

Julius F Neuberger, M D, *New York*.—I am very much interested in Dr Amster's presentation, as a number of years ago I read a paper at the New York Academy of Medicine on this subject Being a nose and throat specialist, I was interested only in cases of hay fever, asthma, and vasomotor rhinitis As chief of the Eye, Ear, Nose and Throat Department of the U S Naval Hospital in Newport, I had a great many service people come under my observation for treatment of hay fever In addition to injection, I treated a great many of them by local application with pads of pontocaine and also a solution of cocaine and adrenalin The pads were applied around the area of the sphenopalatine ganglia The results were often astounding I went further with my experiments and injected the sphenopalatine ganglia directly by breaking through the nose or through the sphenopalatine foramen, using 70 per cent alcohol My results were even better than with the pads In injecting the alcohol I used a few drops of pontocaine first for anesthesia Some of the cases of asthma were either markedly improved or even stopped altogether I presented some of these cases at the Academy of Medicine when I read my paper, and some of the doctors who are here today saw them at that time

I think that there is a great deal to be discovered and to be learned about the sympathetic nervous system, its physiology and pathology, and I think that a great deal of research will be done in the not too distant future

J Lewis Amster, M D, (*Closing*).—Regional anesthesiology and therapeutic nerve block are still in their infancy The introduction of new local anesthetic agents with nontoxic reactions for the prolonged relief of pain and the newer methods of their application should be encouraged We have come to realize that painful impulses are transmitted through the sympathetic nervous system, that stress and strain play an important part in overstimulating the sympathetic nervous system with the production of painful vasoconstriction and painful muscular spasm, that the sphenopalatine ganglion is linked with the superior cervical ganglion, and that sphenopalatine ganglionic block administered early in the course of painful muscular or painful vascular spasm is capable of interrupting the sympathetic pathways and relieving pain

TO ESTABLISH PITTSBURGH HEALTH CENTER

The University of Pittsburgh has announced acceptance of a $13,600,000 gift from the A W Mellon Educational and Charitable Trust for the establishment of a world-leading industrial and occupational health center

The center will form the nucleus of a new Graduate School of Public Health and will be one of only eleven such institutions in the United States and Canada

Chancellor Rufus H Fitzgerald simultaneously announced the appointment of Dr Thomas Parran, former Surgeon General of the United States Public Health Service, as the dean of the new school He will assume the position immediately One of the organizers of the World Health Organization in 1946, he retired as surgeon general early this year

Paul Mellon, Mrs Ailsa M Bruce, and Donald D Shepard, trustees of the Mellon trust, said the graduate school will emphasize occupational and industrial health and hygiene and basic research in all phases of public health But its goal will be to attain "world leadership" in fields of preventive medicine

Under the agreement with the university, an initial $4,000,000 will be given the school to obtain "outstanding" men to administer the school and to assure adequate faculty and teaching facilities An additional $1,600,000 will be given for operating and equipment expenses and development costs during the first five years of operation

The trust will donate not more than $5,000,000 for the construction of the school, its laboratories and facilities, but only after the school is accredited by national scientific authorities for the granting of degrees of Doctor of Public Health and Master of Public Health, and university medical science schools and Pittsburgh hospitals have effected a program of integration

ERYTHEMA MULTIFORME

MAURICE J COSTELLO, M D , and JULES E VANDOW, M D , New York City

(From the Department of Dermatology and Syphilology, New York University College of Medicine, and the Department of Dermatology and Syphilology, Third Medical (New York University) Division, Bellevue Hospital)

THE data presented in this paper are based on the study of 150 cases of erythema multiforme admitted to Bellevue Hospital during the twelve-year period from 1936 to 1948 Actually, there were 127 individual patients in the series Of these, 120 patients were hospitalized once, while the remaining seven were hospitalized a total of 30 times, as shown in Table 1

TABLE 1.—NUMBER OF PATIENTS AND ADMISSIONS

Patients	127
Hospital admissions	150
Single admissions	120
Multiple admissions	7

Types of Erythema Multiforme

It was obvious at the outset that an analysis of the cases would not be of value if studied as a single group, as the clinical features varied greatly from case to case In some patients, the disease was mild and of short duration, while in others it ran a septic course often lasting for many weeks. Involvement of the skin and mucous membranes was as variable as the constitutional reaction. At times, the skin alone was affected, while at other times the mucous membranes of the oral cavity and genitalia were involved simultaneously Infrequently, lesions also appeared on the conjunctivae In a few cases the skin was unaffected, the mucous membranes being the only sites of involvement. The eruptions often simulated pemphigus vulgaris, urticaria, purpura, dermatitis herpetiformis, lupus erythematosus disseminatus, erythema nodosum, and secondary syphilis.

The patients frequently gave a history of drug ingestion upper respiratory infection, or gastrointestinal disturbances. Pyogenic infection, the bite of a wasp and trauma appeared to be significant in a few cases There was obvious association with such diseases as rheumatic fever, rheumatic heart disease, Sydenham's chorea erysipelas vaccinia, and in one instance, giant follicular lymphadenopathy

From this mass of confusing clinical material it was soon evident that some cases had a number of factors in common and could be separated from the entire group to form fairly distinct types. In this respect, we have followed the general suggestions of Ormsby and Montgomery [1] In addition to the five types which they describe, a small number of our cases appeared to belong to a sixth type described in the literature under such titles as ectodermosis erosiva pluriorificalis by Klauder febrile type of erythema multiforme by Leopold and erythema bullosum malignans-pluriorificial type by one of us [2–4] This last type is usually referred to as Stevens-Johnson disease [5]

In the remainder of this paper, we will refer to the mild cases as erythema multiforme of Hebra, who first described this group as a distinct entity [6] Cases difficult to differentiate from pemphigus vulgaris will be referred to as erythema multiforme pemphigoides These two types are grouped together with the Stevens-Johnson type, since the causes of all three remain obscure The remaining cases are referred to as erythema multiforme accompanying infectious diseases when it is associated with a known infection (erythema multiforme accompanying visceral diseases when it appears to be associated with such conditions as rheumatic disease), and finally, as erythema multiforme of drug causation [7–10] Of these types the cause is definitely established only in the last mentioned since in this group the disease can be reproduced almost at will following administration of the known toxic agent or drug

General Incidence

In Table 2 is shown the annual incidence of the various types of erythema multiforme observed at Bellevue Hospital Of the entire group of 150 cases, 90 cases (63 3 per cent) were of the Hebra type, 10 cases (0 6 per cent) were of the pemphigoid type 6 cases (4 per cent) were of the *Stevens-Johnson type 3 cases (2 per cent) accompanied infectious diseases, 20 cases* (13 3 per cent) accompanied visceral diseases, and 16 cases (10 7 per cent) were caused by drugs or other toxic agent Altogether, the Hebra pemphigoid and Stevens-Johnson types, the three types of unknown cause consisted of 111 cases, 74 per cent of the total

Seasonal Incidence

Erythema multiforme of the Hebra type was most prevalent during the spring and early summer, although cases occurred throughout the year, as shown in Table 3 The greatest number of cases developed during July and there was a

slightly higher incidence during December and January than during September, October, and November This was somewhat surprising as this disease was considered to occur more frequently in the spring and the fall Three of the ten cases of the pemphigoid type developed during April, the others occurring during the remainder of the year Erythema multiforme accompanying visceral diseases was most prevalent during December, although cases were also seen throughout the year As was expected, erythema multiforme caused by drugs was distributed throughout the year.

Average Age, Sex, and Race

Table 4 lists the average age of the patients and their distribution as far as sex and race are concerned The Hebra type occurred in patients from six to seventy-six years of age but was more frequent during the third and fourth decades The average age was thirty-seven It appeared to be more common among men, almost twice as many men being affected as women Nearly one third of the cases occurred in Negroes The pemphigoid cases averaged fifty-one years of age, significantly higher than the average age of the Hebra type. The sexes were equally affected Only one pemphigoid type was seen in a Negro In the cases associated with visceral diseases, although the average age was twenty-five, half the patients were children under the age of fifteen The incidence among men was slightly higher than women Only one patient in this group was a Negro, a forty-nine-year-old woman with acute rheumatic fever

Altogether there were 43 Negroes in the entire group, indicating a susceptibility approximately equal to the white race, a finding quite at variance with that of Noojin and Callaway, in whose group of 40 patients no Negro was affected [11]

The occupation of the patients appeared to have no significance Altogether, 46 occupations were noted Most of the patients were students (21), housewives (19), or laborers (12)

The national origin also appeared to have little significance Of the 127 patients, 88 were Americans, while the rest came from ten European countries, Canada, Puerto Rico, and the British West Indies No Chinese was admitted for this disease, although a considerable number reside in New York City However, while it would appear that the disease is rare among them in this city, it is not at all uncommon in China.[12] It is interesting to note that eight of the eleven patients, whose eruptions were associated with rheumatic diseases, were of Italian extraction.

Only one American was affected in the pemphigoid group This was of interest as Americans predominated in all other groups The other

eight patients in this group originated from Russia (2), Poland (2), Austria (2), Hungary (1), and Ireland (1) Five of the nine patients were Jewish.

Erythema Multiforme of the Hebra Type

Hebra observed in 1854 that a group of dermatoses hitherto described as erythema papulatum, erythema annulare, erythema tuberculatum, erythema iris, and erythema gyratum, were actually all variations of a single disease, which he entitled erythema multiforme. He described it as an essentially self limited disease which ran its course in from one to four weeks. In addition to mild subjective symptoms and a tendency to recur, a characteristic eruption of multiform character usually developed upon the extensor surfaces of the extremities. Kaposi and Schwimmer broadened Hebra's concept when they included bullous forms of the disease.[13 14]

In the group of patients under study, 95 were of this type. In 70 patients, the illness began with the appearance of the typical skin eruption. The remaining 16 patients began with symptoms of a mild respiratory infection (11), gastrointestinal symptoms (4), or rheumatic pains (1) from one to fourteen days prior to the appearance of the rash. Toxic symptoms occurred in 49 patients. The most common symptoms were slight fever, headache, general malaise, nausea, vomiting, sore throat, and chills. Less frequently there were cough, arthralgia, abdominal pain, weakness, hoarseness, diarrhea, and generalized aching

Cutaneous Features —The eruption favored the extensor surfaces of the upper and lower extremities, the face, and the neck. It was usually symmetric in arrangement and frequently generalized. The skin was affected in the following order of frequency lower extremities, upper extremities, face and vermilion border of lips, neck, genitalia, trunk, palms, dorsum of hands, soles, inner thighs back, and chest

A decided tendency to polymorphism was the rule. Frequently, there occurred various sized patches of erythema, macules, papules, vesicles, and bullae. At times, the bullae were hemorrhagic. When coalescent vesicular lesions ruptured, large crusted eczematous patches developed, particularly on the extremities. Iris lesions were fairly common. Urticarial lesions were occasionally seen. Other lesions appeared typically purpuric.

Vesiculobullous eruptions were frequently seen in this group This was to be expected in a hospital series, as only the more serious cases of erythema multiforme are generally admitted to the wards. Sixty-two of the 95 cases developed vesicles or bullae at some time during the course of the disease Thirty-one patients had cutaneous and oral involvement, 22 patients developed lesions of the genitalia either at the onset or later on Occasionally, a patient was seen with either mouth or genital lesions alone, without involvement of the cutaneous surface at any time. Eleven patients had mild to moderately severe accompanying conjunctivitis

Thirty three patients complained of cutaneous discomfort, such as pruritus, burning, or tenderness. The remaining patients had no discomfort as far as the skin was concerned. Staining or hyperpigmentation was frequently noted after the lesions had healed but usually disappeared after a time, except in many of the Negro patients.

The majority of the patients had few complaints except as already noted Usually there was a low grade temperature ranging between 99 and 100 F for a variable period from one to fifteen days with an occasional higher elevation. In a rare case, the temperature continued for thirty days Twenty patients had no elevation of temperature. The average period of hospitalization was eighteen days for the Hebra type of erythema multiforme.

Laboratory Findings —Slight elevation of the leukocyte count occurred in half the patients. The differential leukocyte count was normal as a rule. The erythrocyte count averaged 4 500, 000 and the hemoglobin averaged 12.3 Gm. Urinalyses were for the most part normal No abnormalities were found in the blood nonprotein nitrogen, urea nitrogen, creatinine, chlorides calcium phosphorus, sodium, potassium, or total protein in the few patients who had chemical examination of the blood. Blood cultures were negative in six patients examined. Culture of contents of the bullae showed staphylococci. Smears of bullous fluid usually revealed the presence of many polymorphonuclear leukocytes, a few lymphocytes, and, rarely, an eosinophil

Associated Diseases —In the group, there were three patients with diabetes mellitus, three patients with syphilis (two latent and one with nodular gummata), five patients with gonorrhea, three patients with active pulmonary tuberculosis, and one patient each with the following rosacea, stasis dermatitis, asthma, tinea cruris, and postpoliomyelitis paralysis. Erythema nodosum was associated with erythema multiforme in two patients. Trauma apparently played a significant role in three patients Ten patients were chronic alcoholics and in four of these the disease began during periods of prolonged imbibition. According to Keil, chronic alcoholism may predispose to erythema multiforme.[15]

Noncutaneous Physical Findings —Sixteen patients revealed evidence of infection of the upper respiratory tract. Seven patients had poor

dental hygiene Generalized lymphadenopathy was found in seven patients The liver was enlarged in nine patients, three of whom were alcoholics The spleen was enlarged in three patients

Treatment—The efficacy of treatment is difficult to evaluate when the disease in question is self-limited This is certainly true of erythema multiforme in which it is impossible to foretell how long the toxic symptoms or the efflorescence will persist in a particular case. Treatment has usually been symptomatic Analgesics, antipyretics, sedatives, hypnotics, and cathartics of every description have been administered Locally, many lotions, ointments, and medicated baths have also been used

In 1938, chemotherapy with the sulfonamides was added to the usual symptomatic medications and found to be of no specific value Large doses of vitamins, particularly the various factors of the vitamin B complex, were administered, possibly because in many cases the mouth lesions suggested general debility, pellagra, or some other vitamin deficiency This type of therapy was ineffective In recent years, penicillin has been administered Although it is of value for the secondary infections that occasionally develop, it has not been found to have any favorable influence upon the course of the disease Antihistamine drugs such as benadryl and pyribenzamine were used in a few cases They did not prevent recurrences or relapses, and lesions spread in spite of their administration There were no deaths in this type of erythema multiforme

Erythema Multiforme Pemphigoides

Cases of erythema multiforme are occasionally seen which resemble pemphigus vulgaris very closely and, because of this striking similarity, are referred to as pemphigoid This term has also been employed to describe the severe bullous eruptions which sometimes follow smallpox vaccination or the ingestion of certain drugs [16] We prefer, however, to classify such cases as of either infectious or of drug origin and reserve the term pemphigoid for cases of unknown causation Among our patients, there were ten examples of this type or about 7 per cent of the entire group

Mode of Onset—The disease began in nine patients with the appearance of cutaneous lesions In the tenth patient, painful mouth lesions developed first and were present for a week before the skin became affected Fever was usually present from the onset

Cutaneous Features—The eruption in all patients consisted of vesicles and bullae Usually, the bullae were surrounded by an erythematous halo, but in three patients they arose from normal skin They tended to rupture early with the formation of crusted lesions Grouping, iris lesions, and a positive Nikolsky sign were observed in several patients

In the majority, the lesions were roughly symmetric and generalized Excluding the mucous membranes, the most common locations were the face, dorsum of the hands and forearms, the neck, the torso, and the lower extremities The palms and soles were not affected except in two patients who developed erythema and desquamation in these areas rather late in the course of the disease

Usually, severe itching, burning, or a combination of both occurred, either at the onset or during the course Three patients had no discomfort referable to the skin

Mucous Membrane Lesions—Involvement of the oral mucous membranes occurred in six patients The lesions consisted of irregular areas of erythema, millet-sized vesicles, ruptured bullae, and superficial erosions of the soft palate, tongue, cheeks, and pharynx Dried crusts and fissuring were seen on the vermilion border of the lips in several patients Mild conjunctivitis with mucopurulent exudate occurred in three patients In two women, pea-sized erosions developed on the labia

Constitutional Symptoms—The prodromal symptoms, which were commonly seen in the other types of erythema multiforme, especially the Stevens-Johnson type, were strikingly absent in all the pemphigoid cases Loss of weight, strength, and appetite did not occur in this group There were few systemic symptoms other than moderate fever and general malaise

Clinical Course—Moderate fever occurred in eight of the ten patients in this group and was usually present from the onset In general, these patients were hospitalized for longer periods and developed higher temperatures than the patients with the Hebra type The temperature usually ranged from 102 to 104 F persisting from two to six weeks

Despite the extent of the eruption, the mucous membrane involvement, and the prolonged fever, the patients did not feel too ill Recovery appeared to be spontaneous, the course hardly being affected by therapy The average period of hospitalization was thirty-seven days, twice as long as that of patients with the Hebra type

Laboratory Findings—The leukocyte count was usually normal or slightly increased A 9 per cent eosinophilia was seen in one patient Moderate secondary anemia was usually present The Pels-Macht test in five patients was inconclusive, being reported as follows 54 per cent, 75 per cent, 59 per cent, 31 per cent, and unsatisfactory

Complications and Mortality—Secondary pyogenic infection of the bullae occurred occasionally, and in one patient a cellulitis of the elbow developed There were three fatalities among the patients in this group Their advanced age (eighty five, seventy-three, and seventy five) and general debility were no doubt contributory Two of these patients developed terminal bronchopneumonia.

Recurrences—Five patients gave a history of recurrent attacks One patient had four attacks over a thirty-five-year period Another patient had an eruption which had persisted for eight months, new lesions developing while old ones healed A third patient had frequently recurring vesicles and bullae of the oral cavity over a period of six years. In two patients, there was a history of only two attacks

Treatment—As with the Hebra patients, treatment was mainly symptomatic For the relief of cutaneous discomfort, potassium permanganate baths, vaseline gauze with acriflavin (1 3,000), wet dressings, soothing lotions, and bland ointments were often utilized. Opening the bullae for the relief of pruritus was a routine procedure. Large doses of vitamins, particularly vitamin C and vitamin B complex were usually administered None of the following proved to be of any value desoxycorticosterone injections, a course of rabies vaccine, injections of sodium thiosulfate and sodium gluconate, Fowler's solution, carbarsone sulfapyridine and autohemotherapy

Differentiation from Pemphigus Vulgaris—It was important from the point of view of prognosis to differentiate the pemphigoid cases from pemphigus vulgaris This was always difficult and, in some cases, almost impossible A diagnosis of erythema multiforme pemphigoides was clear-cut in only two of the patients in this group

In the other patients, a diagnosis of pemphigus vulgaris was entertained either upon admission or during the course of the disease. One patient had, in fact, been treated as a case of pemphigus vulgaris, but upon readmission with a recurrence four months later, the diagnosis was changed to erythema multiforme pemphigoides Other factors which suggested a relationship between the two conditions were the following (1) seven patients originated from eastern Europe, (2) five patients were Jewish, (3) the mortality rate was high and (4) most of the patients were in late adult life

On the other hand certain clinical observations made a diagnosis of erythema multiforme pemphigoides more tenable. First, although eruption was extensive in four patients, there were no mouth lesions Loss of weight strength, and appetite did not occur Lesions not usually seen in pemphigus vulgaris, such as areas of erythema without bullae, purpura, and erythematopapular and iris lesions, were observed Severe pruritus was common Scalp lesions, on the other hand, were rarely seen

A fulminating pemphigoid eruption with rapid generalization accompanied by the symptoms described above favors the diagnosis of erythema multiforme pemphigoides rather than pemphigus vulgaris, which, as a rule, becomes generalized only after a period of at least several months.

Stevens Johnson Type of Erythema Multiforme

Various authors have called attention to a rare clinical syndrome which is characterized by abrupt onset with symptoms suggesting an acute respiratory infection with marked prostration and elevation of the temperature and accompanied by the simultaneous development of edematous areas of erythema of the skin and vesiculobullous lesions of the mucous membranes [3-4] Coalescent vesicles and bullae soon develop upon the erythematous areas and tend to rupture within a few days, producing extensive bright red areas of denudation especially around the mouth, eyes, nose, anus, and genitals Usually, there is involvement of the bulbar and palpebral conjunctivae which become suffused and edematous The eyelids are often stuck together by a crusted, greenish-yellow, purulent exudate, and erosions, ulcerations, and scarring of the cornea may result in partial or complete loss of vision. The disease usually runs a fulminating course for about two weeks when the temperature finally falls In many respects, it resembles an acute infectious disease and for this reason is usually admitted to a contagious disease hospital with such diagnoses as chickenpox, diphtheria, smallpox, Vincent's angina, vaccinia, scarlet fever, measles, impetigo bullosa and pemphigus vulgaris In a recent report, the senior author described 33 cases with a mortality of 18 per cent. Six of our patients were of this type.

Mode of Onset and Course—In all six patients the disease began suddenly with marked elevation of temperature, severe constitutional symptoms, and general malaise. Among the symptoms noted were rhinitis sore mouth, sore throat, cough, difficult respiration chills, generalized aching, abdominal pain or discomfort nausea vomiting profuse salivation sore eyes with lacrimation and purulent discharge headache, and weakness Mastication and deglutition were painful Fresh bullae continued to appear for a week or two in most cases The patients ran a continuous temperature, ranging between

101 and 103 F from one to two weeks, marked improvement in the symptoms and mucous membranes and cutaneous lesions appearing at this time The cutaneous lesions were usually healed in from three to five weeks Hospitalization averaged twenty days There were no deaths among these patients

Cutaneous Features—Of the six patients, five had a generalized vesiculobullous eruption The sixth patient had bullous lesions confined to the mouth and vermilion of the lips but eventually developed bullae of the palms two weeks after onset of the illness Eye and mouth involvement occurred in all the patients In four patients there was involvement of the genitalia as well The bullae were usually flat, somewhat flaccid, and were superimposed upon various sized patches of erythema and edema They were from pea- to palm-sized and tended to rupture early, forming crusted and eroded areas particularly over the lips, penis, and scrotum Iris lesions with or without central bullae were seen in three patients

Mucous Membrane Lesions—In addition to the severe constitutional symptoms which characterize this type of erythema multiforme, mucous membrane lesions are invariably present The eyes and mouth were always affected—the nasal mucous membranes and the lips in five patients, the pharynx in three patients, the anus in one patient The eyes usually showed moderate to severe injection of the palpebral and bulbar conjunctivae, mucopurulent or purulent discharge, blepharitis, and edema of the eyelids The patients complained of pain and burning of the eyes and lacrimation The nasal mucous membranes and the pharynx were usually swollen and inflamed Hemorrhagic crusts and purulent nasal discharge were also observed The lips were often dry, swollen, fissured, and covered with hemorrhagic crusts and ulcerations The buccal mucous membranes were usually inflamed, the gums were edematous and bled easily Erythematous patches, bullae, and denuded areas covered with a white or gray exudate were often seen in the mouth

Laboratory Findings—A slight leukocytosis was usually present, varying from 10,000 to 15,000 The differential leukocyte count was normal Occasionally, there was a slight shift to the left The erythrocyte count and the hemoglobin were usually normal Albumin, pus cells, and granular casts were found in the urine at times

Complications—One patient developed lobar pneumonia but recovered rapidly with sulfonamide therapy Secondary infection of the bullae was occasionally seen Hyperpigmentation usually remained after the lesions healed

Treatment—Treatment was mainly supportive and directed against the various constitutional symptoms presented by the patient The oral lesions were treated with saline or medicated mouth irrigations Boric acid irrigations, argyrol, and 1 2,500 metaphen solution were used for the eyes Petrolatum and boric acid ointment were frequently applied to the lips and eyelids to soften the crusts Analgesics and antipyretics were administered for pain and fever Sulfanilamide and sulfapyridine were given to two patients and appeared to be helpful, but this is difficult to evaluate, as the other patients recovered without the use of sulfonamides Large doses of thiamine chloride, riboflavin, nicotinic acid, vitamin B complex, and vitamin C were administered to four patients Penicillin was not utilized in these cases as it was not available for civilian use at the time It is of undoubted value in preventing secondary infections particularly of the respiratory tract Serious eye complications may also be prevented by the prompt use of penicillin

Erythema Multiforme Accompanying Infectious Diseases

Occasionally, erythema multiforme is seen accompanying such diseases as typhus fever, malaria, cholera, glanders, measles, and septicemia Apparently, other infections may also be a factor In one of our patients, a typical eruption appeared during an attack of erysipelas, and in the other patient who was admitted twice, vaccination against smallpox was responsible Cases following vaccinia have been reported in the literature and were seen frequently following the mass vaccination of New York City residents in April, 1947 The case following vaccination was unusually severe and prolonged and is described below because of these and other unusual features

Case 1—Postvaccination—C M, a Negro boy, age fourteen, was admitted to Bellevue Hospital on June 9, 1947, with a diagnosis of dermatitis of unknown cause The patient had been successfully vaccinated on April 28, 1947 Two weeks later, a vesiculobullous eruption appeared on the neck and spread quickly to involve almost the entire body surface and the mouth Admission temperature was 101 8 F, and the patient complained of headache, malaise, and sore mouth The temperature was septic in type for eleven days and fluctuated from 99 to 104 F For another eleven days it remained about 101 F, finally becoming normal on the twenty-fourth hospital day After three days of normal temperature, it again rose and for four days assumed a septic character, once more with a daily elevation to 104 and 105 F New bullae continued to appear throughout the entire period of hospitalization until the temperature became nor-

mal for the second time The lesions finally healed leaving residual hyperpigmentation, and the patient was discharged on July 15 1947 thirty-six days after admission. Throughout the illness, there were no physical findings, other than the eruptive manifestations in the skin and mucous membranes

Urinalysis revealed a slight trace of albumin and occasional pus cells. The leukocyte count was 7 600 and the differential count was normal The erythrocytes numbered 4 000 000 and the hemoglobin was 12 Gm. The leukocytes increased to 13,050 while the temperature was septic and there also occurred a shift to the left at this time the polymorphonuclear leukocytes increasing to 81 per cent The leukocyte count became normal a week before the patient left the hospital and an erythrocyte count indicated a fall to 3 270 000 Treatment consisted of forcing fluids, high protein and vitamin diet, and aspirin for the first few days. The bullae were opened under sterile precautions and acriflavin-vaseline gauze was applied Penicillin was administered from June 14 to 27 (25 000 units every three hours) but fever and malaise persisted and bullae continued to develop Sulfapyridine and benadryl were then administered and the temperature finally declined However despite these two drugs, the temperature again became elevated on July 8 and medication was discontinued. A second course of penicillin was then administered.

The patient was readmitted on August 1, 1947 two weeks later and ran a course similar to that already described until discharge on August 20 During the relapse the mouth was not affected The patient felt fairly well despite the high temperature and the generalized eruption The appetite remained good, and there was no loss of weight or strength As before penicillin was administered for eleven days and sulfathiazole was substituted later on The patient was discharged in good condition

Erythema Multiforme accompanying Visceral Diseases (Osler)

Attention has been directed by many investigators to the association of erythema multiforme with organic disease of the heart, lungs gastrointestinal tract, bony articulations, and other body tissues [9,16,19] The significance of this relationship is still unknown

Rheumatic fever and the accompanying involvement of the heart joints and nervous system was the most frequently observed associated disease.

Type of Eruption —Most frequently the eruption consisted of sharply circumscribed areas of erythema, either flat or elevated about 1/2 to 1 cm in diameter The color varied from pink to dusky or bluish-red At times, the centers were pale, more rarely a deeper shade of red than the periphery In several patients the lesions coalesced, and a picture of erythema marginatum developed when the central areas faded Although the lesions were usually discrete several patients developed diffuse blotchy various sized, irregular areas of erythema. The eruption had a predilection for the extensor surfaces of the extremities and was usually symmetric Generalization of the eruption was not seen. Lesions did not appear in the mouth or on the genitalia Vesicular or bullous lesions did not occur [20] In the average case the eruption appeared rapidly, evolved without cutaneous discomfort, and disappeared, usually within four or five days In most of the patients a history of frequent recurrences could be obtained

Systemic Features —For the most part the patients in this group were severely ill with elevated temperature, acute polyarthritis or symptoms of congestive heart failure. In some patients symptoms of an acute upper respiratory infection or gastrointestinal disturbance developed one to two weeks before the appearance of the efflorescence

Laboratory Findings —The only significant laboratory findings were moderately rapid erythrocyte sedimentation rate in all patients and evidence of kidney disease in about half the patients the urine containing albumin casts and red and white blood cells The leukocyte count was usually normal or slightly elevated *Throat cultures revealed presence of hemolytic* streptococci in three patients and Streptococcus viridans in one patient. Blood cultures were sterile in three patients

Erythema Multiforme of Drug Causation

Strictly speaking, the cases caused by drugs should be classified as dermatitis medicamentosa erythema multiforme type This type is comparatively rare in hospital practice Among 329 patients admitted to Bellevue Hospital for drug eruptions from 1936 to 1948 only 15 cases of this particular type were observed In the entire series under study, 48 of the 150 patients gave a history of drug ingestion prior to the appearance of the eruption. In only these 15 cases however did we feel that the drug was the actual cause The following drugs were implicated sulfonamides (five cases) antipyrine (three cases) phenolphthalein (two cases) penicillin, aspirin, quinine arsenic and turpentine (one case each) The eruption was vesiculobullous in those cases caused by the antipyrine, phenolphthalein quinine, turpentine and in four of the five cases caused by *sulfonamides*. One patient developed his eruption immediately following the bite of a wasp and perhaps does not definitely belong in this group His eruption however was typically multiforme in character and is therefore included although the appearance of several lesions and his rapid recovery suggested an acute urticarial reaction It should be noted in passing that urticarial lesions are occasionally ob-

served during the course of erythema multiforme and has been noted by many investigators including Engman, Osler, and others [7,8]

Summary and Conclusions

1 One hundred fifty cases of erythema multiforme were observed on the dermatologic wards of Bellevue Hospital from 1936 to 1948

2 Approximately 1 per cent of the patients admitted to these wards had some type of erythema multiforme

3 The cases were separated into six types on the basis of their clinical characteristics or because of an association with a definite disease or when the cause was unknown

4 They were listed as follows (1) Hebra type, 95 cases, (2) pemphigoid type, ten cases (which at times closely simulates *pemphigus vulgaris*), (3) Stevens-Johnson type, six cases, (4) those cases accompanying certain infectious diseases, three cases, (5) those cases associated with rheumatic fever, the visceral type, 19 cases, and (6) those cases caused by drugs or toxins, 19 cases

5 An effort has been made to differentiate the pemphigoid type of erythema multiforme from the fatal disease, pemphigus vulgaris, on a purely clinical basis

6 The serious ophthalmologic complications of the Stevens-Johnson type are emphasized It can, as a rule, be differentiated from the pemphigoid type by the presence of prodromal symptoms which are always absent in the latter

7 The eruption occurring in the rheumatic cases of the visceral type is distinctive in our series in that vesicles and bullae were not observed Patchy areas of erythema were the usual findings

8 Dermatitis medicamentosa of the erythema multiforme type may be indistinguishable from the Hebra and the pemphigoid types, and it is occasionally confused with the Stevens-Johnson type

9 In the interest of accurate medical records, which may later be used for statistical purposes as in this report, we suggest that charts of the patients with this type be labeled dermatitis medicamentosa (name of drug), erythema multiforme type

10 Of the 329 patients admitted for dermatitis medicamentosa (1936 to 1948), 15 patients, or 4 8 per cent, were of the erythema multiforme type

11 Drugs and infections have been advanced as the precipitating or predisposing cause of three types The causes of the Hebra, pemphigoid, and Stevens-Johnson types are still obscure A virus has been suspected in the Stevens-Johnson type

12 It is obvious from the considerations set forth here that an accurate laboratory method would be an invaluable aid in differentiating erythema multiforme pemphigoides from pemphigus vulgaris

13 The salicylates are of some value in the Hebra type, penicillin injections aid in preventing secondary infection, especially in the Stevens-Johnson type Otherwise, the treatment is symptomatic and supportive

Discussion

Frank C Combes, M D, *New York City* — I heartily endorse the authors' classification of this confusing group of polymorphous erythemas which they have prepared from personal observation of a large number of cases

The term "erythema" has always been loosely and indiscriminately applied by dermatologists Fundamentally, it means an abnormal redness of the skin due to capillary congestion Nevertheless, there are included such diverse conditions as erythema intertrigo due to friction and erythema induratum due to the tubercle bacillus—neither condition remotely resembling the other etiologically, pathogenically, clinically, or therapeutically

Erythema multiforme, as has been pointed out, is one of these confusing entities which, in my opinion, might better be included in the "dermatitis group" In fact, Jadassohn, almost half a century ago, recommended an appropriate name for it, "dermatitis erythematosa multiformis." The only reason I hesitate to endorse this term is that our nomenclature already abounds with unwieldy, clinically descriptive names Some of our designations in the erythema group have already been improved upon, as witness tuberculosis indurativa for erythema induratum and dermatitis contusiformis for erythema nodosum

As the authors have told us, we should not glibly make a diagnosis of erythema multiforme without a searching inquiry as to its cause Even the statistics they have given us impress me that their number of the "Hebra type" is larger than it should be Remember that this type is idiopathic It constitutes a dumping ground or a place where one may affect the appearance of erudition and cloak his ignorance beneath the questionable protection of that euphonious term "erythema exsudativum multiforme Hebrae"

Doctor Fred Wise prefers to limit use of the term erythema multiforme to the Hebra type and erythema nodosum, excluding all the many forms of the polymorphic and multiform varieties which are not "idiopathic" Here, however, we encounter difficulties based on cause and pathogenesis

Some may think Stevens-Johnson disease should not be included, others might desire to exclude the bullous types of dermatitis medicamentosa However, I think the authors have full justification for their classification as offering a firm basis for further study of this group of diseases from a differential diagnostic viewpoint and are to be congratulated on their presentation

SOLAR BURNS OF THE FUNDI

CHARLES A TURTZ, M D, F A C S New York City

PROLONGED action of visible rays of light may cause dazzling lacrimation, blepharospasm, pain, and disturbances in vision. It is well known that intense radiant energy has an injurious effect upon the eyeball, causing tissues to become inflamed and irritated Fortunately, many heat rays are absorbed by the water in the media, so that the deeper structures of the eyeball are protected by its natural moisture As the retina is free from sensory nerves, pain is caused by the action of light upon the cornea iris, and ciliary body According to Vogt, only 20 per cent of heat rays reach the retina.[1]

The spectrum of any source of light contains both visible and invisible rays Adjoining the red end of the spectrum are the invisible infrared or heat rays and beyond the violet end are the invisible short ultraviolet rays It is the latter which are chemically active According to Duke-Elder, visible light rays which are absorbed by the eye may produce one of three effects visual thermal, or photochemical (abiotic) [2 3]

Heat and light rays unite to focus upon the retina and there may develop into intense heat It is like focusing a strong lens on a match which it can actually ignite.

Verhoeff and Bell in 1916, Duke-Elder in 1926, and other workers have produced lesions experimentally by exposing the eye to infrared rays [4,2 3] Recently, Berens and McAlpine reported two cases of solar keratoconjunctivitis associated with amblyopia.[5]

Reflections from water, sand, or snow, or prolonged looking at the sun, an eclipse, strong electric lights or flames in a furnace may produce damage at the macula so that minute vision such as reading or sewing, is permanently impaired

During the past four years, I have observed five cases of burns of the retina. Three were seen within a few days after exposure to strong sunlight The other two were seen four to six hours after exposure to sunlamps All five complained of pain, photophobia, and lacrimation, and all had conjunctival injection to a varying degree several hours after exposure Three were young women eighteen twenty-one and twenty-seven years old, respectively Two were men, thirty nine and forty-eight years of age Their general health and vision was excellent prior to the retinal burn The women gave a history of direct and prolonged exposure to the sun, one while in Florida, and the other two during the summer months at the Long Island beaches One man, while answering the telephone during a sunlamp treatment, removed his sunglasses. The exposure lasted about ten minutes Three hours later his vision was reduced to fingers at three feet. The corneas were steamy and showed punctate staining The following day his vision was 20/70, and the corneal edema had cleared up The fundi showed no visible pathology His peripheral fields, tested with a 5-mm. white test object were uniformly contracted. This condition returned to normal in ten days and vision gradually improved to 20/30 but a relative central scotoma remained in each eye

Presented at the Third Congress of Ophthalmology Havana January 8, 1948.

Of the four other cases, three were seen from eight to ten days after exposure to direct sunlight All complained of early lacrimation and blurred vision At the time of the examination, the eyeballs were not injected, and the central and peripheral fields were quite normal In one case gray punctate spots were seen surrounding the macula All four cases had reduced vision (20/70 to 20/40) which cleared up in about two weeks, but a relative central scotoma remained in four cases, and in one a small absolute scotoma for green was present This interfered greatly with reading or sewing

Summary

According to Parsons, all visible rays and some infrared rays pass unimpeded to the retina [6] Much of this radiation is absorbed by the pigment epithelium, and it is probable that the pathologic changes are produced by the resultant heating effect An early examination with the ophthalmoscope may reveal nothing pathologic, or a pale spot, surrounded by a brownish ring, may be seen at the fovea Later, there may be pigment deposits and a small gray punctate spot around the fovea, and this may be replaced by a hole

There may also be seen a generalized grayness of the retina, temporal to the disk, surrounding a small hemorrhage Some believe this pathology to be a localized vasospasm of the retinal arterioles and capillaries initiated by thermal or infrared rays This is believed to be followed by a compensatory dilatation producing increased capillary permeability, severe edema, autolysis or actual necrosis of the retina, and finally a hole in the macula

The prognosis should be guarded Even though improvement may occur, a positive scotoma with permanent impairment in vision usually results

It is obvious that the public should be enlightened as to the dangers of prolonged exposure to sunlight and the careless use of sunlamp treatments without adequate protection to the eyes

OLD AGE MAKES GOOD

Horatio Alger, prototype of the "go-getter" businessman, would have much more difficulty in adapting himself to business and industry today than he did in yesterday's fiction, Dr Anthony J Lanza, director of the Institute of Industrial Medicine of the New York University-Bellevue Medical Center, said recently

Basing his remarks on a recent survey among leading business executives of some of the nation's top firms, Dr Lanza said that the elderly worker has come into his own, and now holds a distinct advantage over the youngster

"Executives almost unanimously agree that the teen-ager and worker in his '20's has less stability, pays less attention to responsibility, and is absent more often," he reported "On the other hand, one firm, with more than 100 active persons over 65 years of age on its payroll, graded less than 10 per cent as 'unsatisfactory' workers"

Uncertainties of the future, coupled with postwar readjustments, were cited as contributory factors to youth's record

"O GOD! O KINSEY!"

A contributor to *The Lancet* has thus hymned the Kinsey report

O cupid! Cast away your bow and quiver—
Statistics prove your method inexact
O Donne! Go take a jump into the river
You hymned the essence, but ignored the fact

Locked in some cool aseptic heaven above,
Trained statisticians painlessly inquire
Into the quaint geometry of love,
The quantitative aspects of desire,
Observe the conduct of the lovesick male
(Not passionate, not noble, not obscene),
And plot it on a logarithmic scale,
Noting a random scatter round the mean

O monumental volume, smug and fat!
Did Man, who wrote the Song of Songs, write that?
O God! O Kinsey! O Jehoshaphat!

—Time, September 27, 1948

NEWER ASPECTS OF CLINICAL ELECTROCARDIOGRAPHY

RICHARD GUBNER, M D and HARRY E UNGERLEIDER, M D , New York City

(From the Medical Research Division Equitable Life Assurance Society of the United States New York City and the Department of Medicine Kings County Hospital and Long Island College of Medicine)

TO THE uninitiated the syllables formed by P-Q-R-S-T, which is the alphabet of electrocardiography, are often regarded as precise pronouncements to which more familiar and less exact methods of clinical observation must need defer The electrocardiograph is to be sure, a precision instrument, but it does not follow that the information it supplies is accordingly precise The development of clinical electrocardiography has been largely empiric, various patterns having been found to be associated with specific pathologic states The fundamental studies of Wilson and his coworkers from which so many recent contributions derive, and recent observations employing endocardial and unipolar extremity leads have helped to place electrocardiography on a sound physiologic basis [1-3] It is our object to translate this newer knowledge of electrophysiology of the heart into terms of direct clinical interest and to show how an appreciation of a few fundamentals helps in the interpretation of conventional electrocardiograms

The electrical activity of a single isolated muscle fiber or nerve bears a remarkable resemblance to the clinical electrocardiogram, i e a QRS complex representing excitation or in terms of the physiologic membrane depolarization, and an S-T interval and T deflection representing repolarization or return to the resting state Our physiologic knowledge of the T wave is in the realm of hypothesis, for it is subject to the most varied influences In the isolated fiber, T is oppositely directed to the QRS, whereas clinically it is most often in the same direction Understanding of the QRS complex, the excitation wave, is somewhat more substantial however A brief consideration of the derivation of the QRS helps one to visualize and to understand what occurs in the various leads in health and in disease. It will suffice to mention one electrical phenomenon, namely, that current traveling toward a point of registration is recorded as a positive deflection.

Genesis of the Ventricular Complex

One recalls that excitation of the ventricles occurs via the specialized conduction system the impulse traveling with great speed from the auriculoventricular node through the bundle of His dividing in the interventricular septum into the left and right bundle branches which then ramify as the Purkinje network through the subendocardial regions of both ventricles almost simultaneously (Fig 1) Thence the impulse spreads directly through the ventricular walls externally Since current traveling toward a point of registration is recorded as positive and current traveling away from a point of registration is negative, an electrode placed outside the left ventricle, whether it be directly epicardial or on the surface of the body, as at the apex or left arm, will record a positive ventricular complex (an R spike and positive T), whereas an electrode placed in the interior of the heart will record a negative ventricular complex (a Q deflection and negative T) Since the major impulse travels away from the right arm (there being no ventricular wall facing the right arm but rather the aorta and pulmonary artery), a right arm electrode records a negative potential similar to the interior of the ventricular cavity Interestingly enough, leads over the right ventricle (which in electrocardiographic terminology correspond to the V_1 and V_2 position on either side of the sternum) also record a predominantly negative deflection, much as though the right ventricle did not exist at all and very much resembling leads from the interior of the right ventricle The reason for this as is apparent from the anatomic cross section of the heart illustrated in Fig 1 is that the muscle mass of the right ventricle is but a small fraction of that of the left

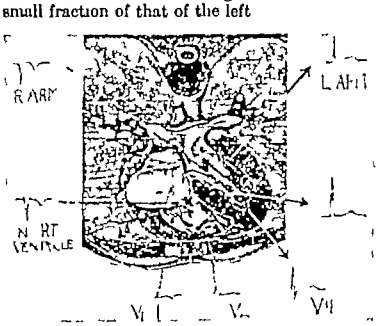

FIG 1 Cross section of chest through heart illustrating the appearance of the ventricular complex at various points.

Presented at the 140nd Annual Meeting of the Medical Society of the State of New York, New York City General Sessions, May 19 1948.

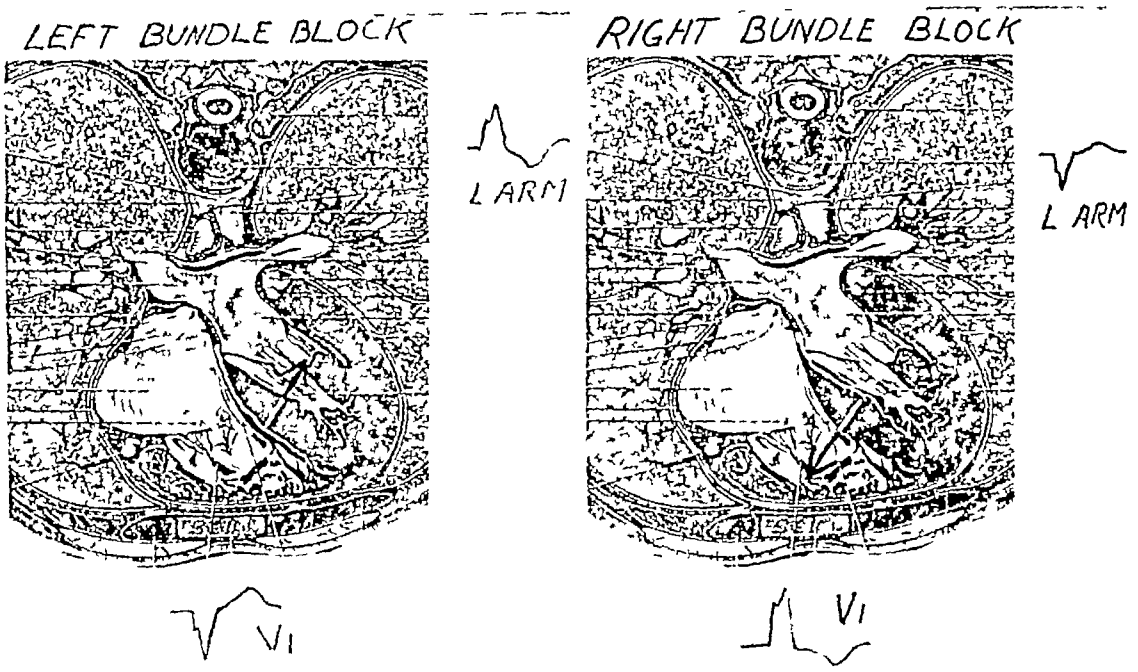

FIG 2 Derivation of the ventricular complex in bundle branch block.

The conclusion is inescapable, as we have indicated elsewhere, that the right ventricle contributes but negligibly to the normal electrocardiogram [9] Even in right ventricular hypertrophy the characteristic changes are produced by rotation of the heart rather than by increased muscle mass, and it is only in extreme right ventricular hypertrophy (as in tetralogy of Fallot) that the greatly thickened right ventricle produces a large positive deflection in precordial leads in the V_1 and V_2 positions over the surface of the right ventricle The small positive deflection normally observed in the V_1 and V_2 positions (Fig 1) is due not so much to the right ventricle as to the fact that the earliest activation of the ventricles occurs on the left side of the interventricular septum so that, for a brief hundredth of a second or so, the predominant excitation wave is traveling to the right from the left side of the septum and is recorded as a small R wave in the V_1 and V_2 positions Thereafter, the impulse travels internally through the septum equally from both sides, and the opposite vectors oppose and cancel one another so that the interventricular septum, a large muscle mass though it be, normally contributes very little to the electrocardiogram Since neither the right ventricle nor the interventricular septum under normal circumstances contribute significantly to the electrocardiogram, one arrives at the important conclusion that the ventricular complex represents chiefly the electrical activity of the free wall of the left ventricle

In bundle branch block, however, the interventricular septum becomes the determining factor in the electrocardiographic pattern (Fig 2) Thus, in right bundle block the impulse now travels unopposed from the left to the right side of the septum Consequently, leads over the surface of the right ventricle (V_1 and V_2) exhibit an upright (and due to the aberrant conduction pathway, a wide and notched) QRS, and a lead from the left arm, which in effect may be regarded as the conventional lead 1, exhibits a downward deflection, i e , right axis deviation Conversely, in left bundle branch block the impulse travels unopposed from right to left, and the V_1, V_2 leads reveal a negative QRS while the left arm (or lead 1) shows a positive QRS

Derivation of Unipolar and Standard Limb Leads

Normally, the position of the heart is such that the free left ventricular wall (which, as mentioned, is the major determinant of the ventricular complex) faces the left arm and to a lesser degree the left leg (Fig 3) The ventricular complex accordingly is upright in the left arm unipolar lead and to a lesser extent in the left leg unipolar lead The right arm potential, it is recalled, is always negative since it faces the ventricular cavities The standard limb leads are merely the summation of the unipolar extremity leads Lead 1 is the left arm potential minus that of the right arm, subtracting the negative right arm potential results in augmenting the positive left arm potential in forming lead 1 Lead 2 repre-

sents the left leg potential minus that of the right arm, and again, since one subtracts a negative quantity, the potential is positive Lead 3 is the left leg potential minus that of the left arm, and so if the left arm potential exceeds that of the left leg, the subtraction results in a negative lead 3 potential, i e., slight left axis deviation One sees that the unipolar extremity leads are in effect, interchangeable with the standard limb leads and merely another way of expressing the same potential vectors From the limb leads we can derive arithmetically the unipolar limb leads and vice versa The unipolar leads employed by Wilson and by Goldberger help one to understand the derivation of the limb leads and more explicitly indicate positional variations of the heart, but it should be emphasized that they contribute little information of clinical significance which is not obtained in the standard leads [7 8] Their chief practical application is in the differentiation of the normal from the pathologic Q wave, to be mentioned presently

To return to positional variations of the heart when the heart lies transversely the left arm potential is more strongly positive, and the left leg now not faced by the free left ventricular wall, has a small or negative potential Lead 1 consequently is strongly positive, and lead 3 is decidedly negative, i.e left axis deviation. Conversely, when the heart lies vertically, the free left ventricular wall now faces the left leg, and the ventricular cavity and great vessels face not only the right arm but the left arm as well Consequently, the left arm as well as the right exhibits a negative potential and the left leg a strongly positive deflection There results, therefore, a low or inverted QRS in lead 1 and upright QRS in lead 3, i e , right axis deviation

Q Waves and Infarction

These considerations help one to understand the derivation of Q waves the hallmark of infarction The Q wave, as Wilson has shown is not a new wave due to the infarct itself it is merely a recording of the normal negativity of the interior of the ventricular cavity resulting from the fact that an area of dead ventricular muscle under the recording electrode no longer transmits an excitation wave toward the electrode and forms, as Wilson has put it, a window from the interior of the left ventricle Thus, in typical anterior infarction near the apex an apical lead in the V_3 V_4, or V_5 position will exhibit a deep Q and inverted T (Fig 4) If the infarct extends up high along the left ventricular wall, the window will point to the left arm and one obtains a deep Q in lead 1 as well If the anterior infarct extends into the lower septum, the window faces the precordium in the V_1 and V_2 positions and one records a deep Q in the V_1 and V_2 positions

In posterior infarction the window most frequently points to the left leg, and a Q and inverted T is recorded in the left leg lead or in lead 3 If the posterior infarct is high, the window may not point to the left leg but posteriorly, and a Q may be detected only in esophageal leads as Nyboer has shown [10] This is not a routinely feasible procedure, and we have found that it is quite satisfactory to record the activity of the back of the ventricle with an electrode placed over the lower left chest posteriorly just above the diaphragm and below the left scapula In certain

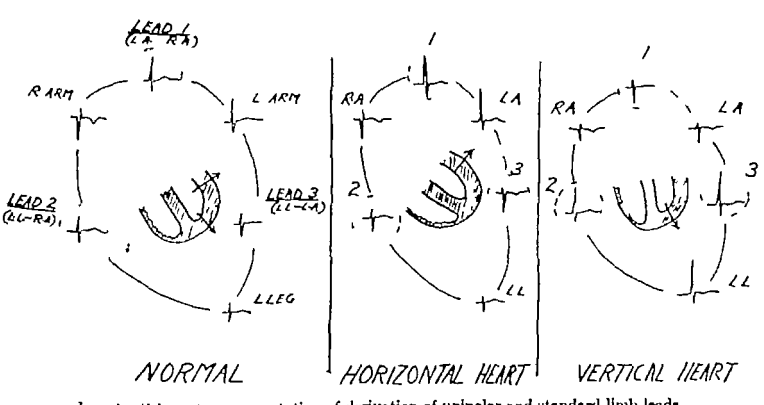

FIG 3 Schematic representation of derivation of unipolar and standard limb leads.

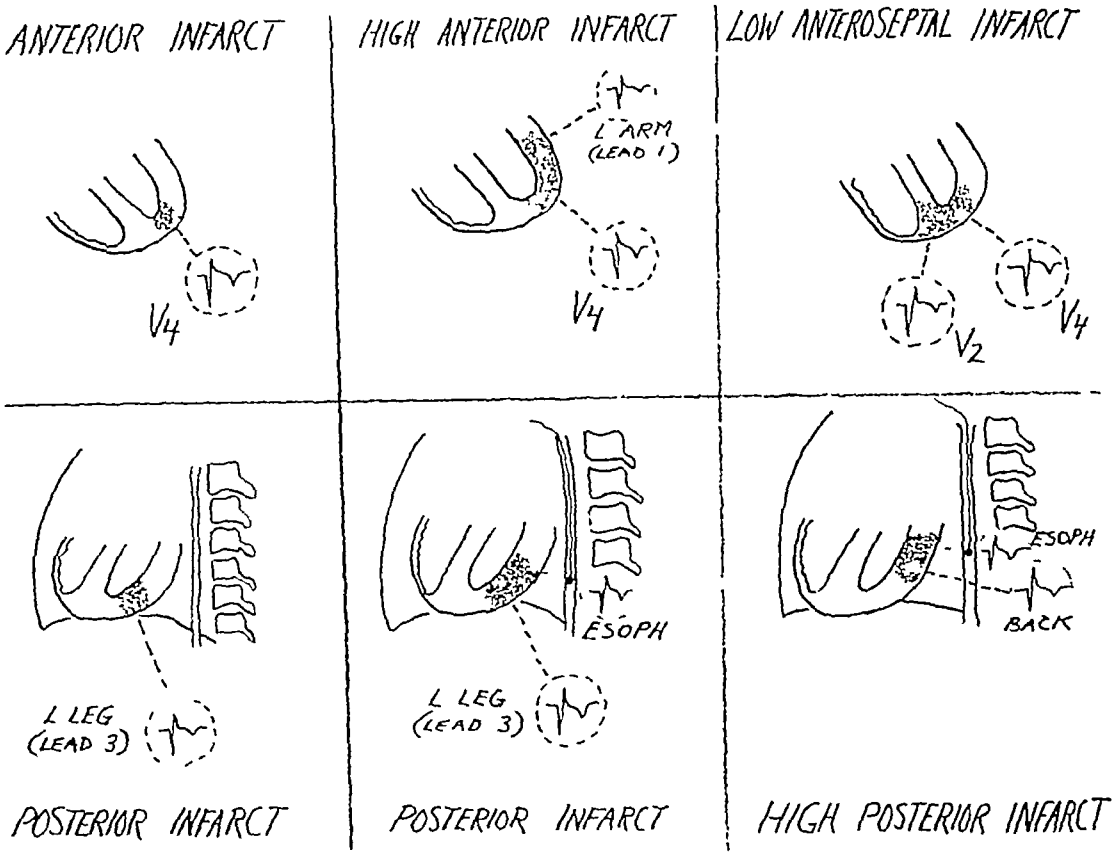

FIG 4 Derivation of Q waves in infarction.

cases of posterior infarction a definite Q will be detected which is not present in the unipolar left leg lead or in lead 3 (Fig 5) Leads from higher levels of the back, above the level of the left ventricle, normally exhibit a Q and inverted T

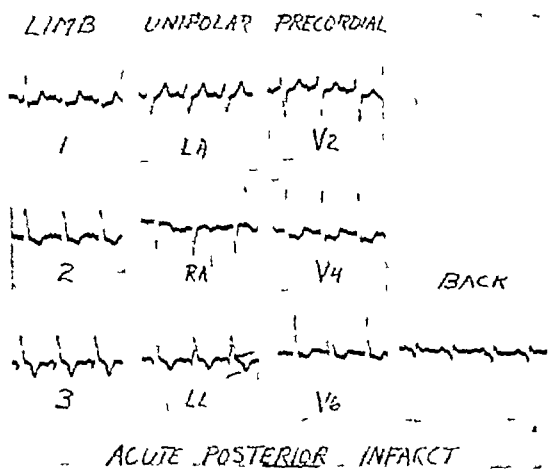

FIG 5 Acute posterior infarct. A lead from the lower left chest posteriorly reveals a definite Q wave, in lead 3 and in the unipolar left leg lead only a small Q is observed In high posterior infarcts the "window" faces posteriorly and may not face the leg

One sees, therefore, that in a real sense it is possible to map out the location and extent of the infarct The electrocardiogram has been employed principally for the diagnosis of infarction but it is of value prognostically as well in indicating the extent of infarction This becomes of some therapeutic importance since large infarcts particularly are an indication for anticoagulant therapy in view of the heightened occurrence of mural thrombosis and embolization In a recent study we found very definite differences in the electrocardiographic patterns in a group of 50 subjects with acute, initial, fatal attacks of coronary occlusions as contrasted with 50 subjects who survived the attack [11] Certain electrocardiographic features were found to occur preponderantly in the fatal cases and relatively infrequently in the surviving cases In anterior infarction these included deep Q wave in lead 1, the aBB (low R_1, deep S_2, S_3) pattern, and bundle branch block. These patterns are very commonly observed in ventricular aneurysm which is a sequel to extensive anterior infarction When such changes occurred in surviving cases of anterior infarction, they were usually transitory Fatal cases of posterior infarction exhibited a much greater frequency of marked S-T segmental deviation, particularly marked depression in precordial

leads, bundle branch block, and T changes in leads 1 and precordial leads, in addition to the usual Q_3, Q_3, T_3, T_3 pattern In addition to these changes which appear to indicate extensive infarction, other findings occurred preponderantly in the fatal group Among these were electrocardiographic characteristics of combined anterior and posterior infarction, progressive changes other than the usual serial S-T and T evolution, electrical alternans very low voltage of the QRS complex, prolongation of the Q-T interval, depression of the P R interval, and P changes suggesting associated auricular infarction, major arrhythmias such as auricular fibrillation, ventricular tachycardia and heart block, and sinus tachycardia exceeding 110

Among fatal cases of acute myocardial infarction over eighty per cent exhibited one or more of the findings described, while in surviving cases the majority presented the simple anterior or posterior pattern. No significant difference was found in the incidence or mortality of anterior and posterior infarction per se It is evident that one can offer a much better prognosis in acute coronary occlusion when the electrocardiogram reveals the simple pattern of anterior or posterior infarction than when additional abnormalities, such as Q waves over a wide area or additional features we have mentioned, are present.

The Q wave which is such an important sign may be produced by mechanisms other than infarction, particularly in lead 3 Differentiation of the normal from the pathologic Q_3 is an important and very frequent problem A Q_3 not due to infarction may occur when the heart is horizontally placed as in obese individuals or in pregnancy The accentuated positive deflection in the left arm translated into lead 3 becomes a strong negative deflection appearing as a deep S or as a Q wave. This is even more frequently the case in hypertension where the thickened left ventricle produces a strongly positive deflection in the left arm It is worth emphasizing that hypertension with left ventricular hypertrophy is the commonest cause of the deep Q_3. It is in the differentiation of this type of Q_3 from that due to infarction that the unipolar extremity leads have greatest value [12–14] The Q_3 due to infarction produces a Q wave in the left leg lead, whereas this does not occur in the Q_3 due to transverse position of the heart or left ventricular hypertrophy

Ordinarily, the unipolar leg lead is not necessary to differentiate the Q_3 due to infarction, for there are other stigmata in the standard leads which aid in this differentiation. In a study carried out on a large number of subjects with a deep Q_3 divided into three groups—normal insurance applicants hypertensive individuals, and cases receiving disability due to prior posterior infarction—certain findings were shown to aid in the differentiation of the normal Q_3 from the Q_3 due to coronary disease [15] The following were found to be present in 10 per cent or less of normal individuals with a Q_3 conforming to Pardee's criterion but occurred at least three times as frequently in subjects with a Q_3 due to coronary disease. These included the following (*a*) weight less than 5 per cent overweight (*b*) absence of S wave in lead 1, (*c*) Q wave exceeding 1 mm in lead 2, (*d*) low T wave in lead 2 (less than 1 mm), (*e*) wide Q wave in lead 3 (0 04 second or more in duration), (*f*) Q wave in lead 3 which equals or exceeds 75 per cent of the amplitude of the tallest R in the limb leads, and (*g*) deep inversion of the T wave in lead 3 (exceeding 2 5 mm.)

In order of importance the features which were most significant of an abnormal Q_3 were found to be a low T wave in lead 2 the presence of a Q in lead 2 which exceeded 1 mm in amplitude and an absence of an S wave in lead 1 Employing the six electrocardiographic criteria (*b–g*), it was found that 94 per cent of patients with a Q wave in lead 3 due to coronary artery disease exhibited one or more of these abnormalities while only 24 per cent of normal subjects with a Q_3 conforming to Pardee's criterion showed one or more of these findings The presence of one or more of these abnormalities in the standard limb leads usually offers a satisfactory means of distinguishing the so-called normal from the pathologic Q wave in lead 3 If one has a unipolar lead attachment (and the newer machines come equipped with unipolar leads), it is desirable to take a left leg lead, for in a certain number of cases the standard limb leads are indecisive in tracings with a Q_3.

Precordial Leads

What of the precordial leads? Here too, a multiplicity of leads has been recommended Were one to follow the many individual recommendations the complete electrocardiogram would comprise thirty or forty or more leads an impractical and superfluous technic The conventional single precordial lead in the 4 position (left midclavicular line) is usually adequate, but there is no doubt that multiple precordial leads are preferable, and we routinely employ the 2 4, and 6 positions When infarction is suspected the six positions across the precordium should be explored. In arrhythmias we have found the CR_1 or CR_2 lead to be very valuable for this lead records auricular activity particularly well, and we have observed cases of supraventricular arrhythmias such as auricular flutter, which could be analyzed clearly only in the CR_1 or CR_2 lead,

the standard limb leads or other precordial leads failing to record visible auricular activity

There has been much controversy as to whether it is best to employ the unipolar Wilson V chest lead, the paired chest extremity CR (chest-right arm), or CF (chest-left leg) lead Usually, the remote extremity potential is so much less than the chest potential that for all practical purposes CF and CR leads are very similar to unipolar V leads An important exception occurs in vertically placed hearts where the large potential going to the left leg (since in such circumstances the left ventricular wall faces the left leg) may cause the appearance of spurious T wave inversions in the CF lead It is this factor which accounts for the fact that the precordial CF lead may exhibit an inverted T in children and slender asthenic adults, whereas if a V or CR lead is taken the T is normally upright In general, the CF lead is more apt to be abnormal than the V or CR lead We have observed definite cases of anterior infarction revealed in CF leads where V or CR leads were normal If precordial leads are recorded in recumbency and during expiration, spurious abnormalities in the CF lead are less apt to occur, for under such circumstances the left ventricular wall faces the left leg to a lesser degree and the leg potential is accordingly smaller If one encounters abnormal CF leads, it is advisable to do further study with serial precordial leads in the 1 to 6 positions and also record unipolar V precordial leads The CR leads are of less value than V or CF leads, apart from use of the CR_2 lead in studying arrhythmias as has been mentioned

We ought not leave the important subject of precordial leads without emphasizing the importance of correctly positioning and indicating the precordial lead whether it be V_4, CF_4, or CR_4 If the electrode is placed too high on the chest or near the sternum instead of at the 4 position, spurious T wave inversions occur, causing a mistaken diagnosis of myocardial disease This is an extremely frequent error, particularly committed by technicians who, in taking tracings on obese females, fail to have them undress and do not properly place the electrode beneath the breast Slight changes in the position of the precordial electrode cause marked variations, and it is essential that the precordial electrode be properly placed if serial comparisons are to have any validity If electrode jelly is spread over a wide area of the precordium or if the patient is perspiring freely, the potential recorded is not confined to the area under the electrode and variable changes, particularly in the T waves, may be observed [16] One further spurious abnormality in electrocardiography should be mentioned Subjects with vertically placed hearts often show a low T in lead 1 and inverted T in leads 2 and 3 These abnormalities which may be construed as indicating myocardial disease disappear in recumbency

Cardiac Hypertrophy

We have already mentioned that the right ventricle contributes but negligibly to the electrocardiogram The same is true in right ventricular hypertrophy when in extreme hypertrophy only a large R spike may be recorded over the surface of the right ventricle in the V_1 or V_2 position accompanied by a deep S wave in the V_5 and V_6 positions The well-known pattern of right ventricular strain in the limb leads, i e , right axis deviation, depressed ST, and inverted T in leads 2 and 3, is not due to hypertrophy as such but to clock wise rotation of the heart around the vascular pedicle In consequence the ventricular cavity comes to face not only the right arm but the left arm as well, just as in vertical position of the heart The left arm potential becomes negative, resulting in an inverted QRS in lead 1, i e , right axis deviation We have also been able to show that rotation does this by rotating the electrodes on the surface of the body in the opposite direction (right arm electrode above scapula, left arm electrode in left midclavicular line), producing right axis deviation in the same manner as when the heart is rotated instead It must be evident that the right ventricle cannot contribute significantly to the standard limb leads, for it faces anteriorly and there are no appreciable electrical vectors directed toward the extremities The rotation of the heart which causes the pattern of right ventricular strain apparently is caused by hypertension of the pulmonary circuit Thus, in acute pulmonary embolism right axis deviation may develop very quickly where there can be no question of right ventricular hypertrophy Only a minority of cases with pulmonary embolism exhibit the McGinn-White pattern of deep S_1 and Q_3, when it occurs, we may assume that acute pulmonary hypertension is present [17] The various nonspecific changes often observed in pulmonary embolism, such as T wave changes, are due to coronary insufficiency resulting from shock, as Horn, Dack, and Friedberg have shown [18]

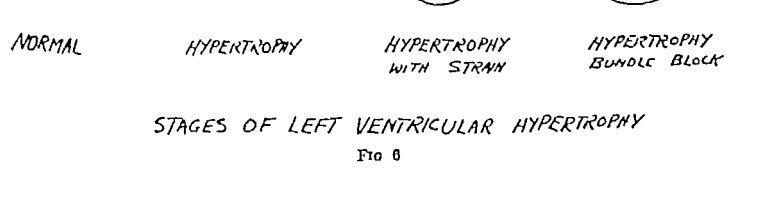
The fact that the pattern of right ventricular strain is produced by rotation of the heart rather than by hypertrophy as such explains why it is impossible to distinguish whether right axis deviation is due to hypertrophy or vertical position of the heart This is important clinically, for conditions producing right ventricular hypertrophy and cor pulmonale, such as pulmonary fibrosis and emphysema, also result in vertical position of the heart as the diaphragm descends

The electrocardiogram offers little help, therefore, in the diagnosis of early right ventricular hypertrophy, and, unfortunately, neither do roentgen methods

Characteristic electrocardiographic changes are observed in auricular hypertrophy consisting of increased amplitude, broadening and notching of the P waves, and frequently auricular arrhythmias *such as extrasystoles, flutter, and fibrillation.* Electrocardiographic evidence of auricular hypertrophy however, is late, and almost always when well developed P wave changes are present, fluoroscopy will reveal definite auricular enlargement with the aid of the esophagram Widening and notching of the P waves, although indicating auricular hypertrophy in younger age groups, are of no diagnostic value whatever in older individuals, since we have found such P wave changes very commonly in older subjects in the absence of auricular hypertrophy

While the electrocardiogram is not too helpful *in detecting early right ventricular or auricular* hypertrophy, it is of inestimable value in detecting left ventricular hypertrophy and is, as we have shown more sensitive than roentgenologic methods In a study of 940 cases reported a few years ago, we established specific criteria for the early diagnosis of left ventricular hypertrophy [10] Left ventricular hypertrophy may be considered to be present when left axis deviation occurs in association with any of the following changes

1 Increase in amplitude of the QRS complex best expressed by the sum of R_1 and S_3 Hypertrophy is present if this sum exceeds 2 5 millivolts and is probably present if it is over 2.2 millivolts The increase in voltage is the earliest electrocardiographic change in hypertrophy R_1 of 16 mm or over is similarly significant



2 Any perceptible depression of the ST segment in lead 1, even in as slight degree as 0 5 mm (0 05 millivolt)

3 Lowering of T_1 below 1 mm. or further degrees of abnormality of T_1

The changes in the ST segment and the T wave may develop in the absence of left axis deviation and left axis deviation is not an invariable or necessarily integral part of the electrocardiographic pattern *of left ventricular hypertrophy* The usual occurrence of left axis deviation with left ventricular hypertrophy in hypertension is due largely to predominant obesity with transverse position of the heart, which in itself causes left axis deviation. In slender subjects with left ventricular hypertrophy left axis deviation is not so often observed

The increased amplitude of the QRS complex may most reasonably be attributed directly to an increased mass of left ventricular musculature (Fig 6) with an increased potential directed to the left arm (lead 1) The changes in the ST segment and the T wave are due to relative ischemia of the deeper layers of the left ventricle This is occasioned by increased work of the heart without commensurate increase in coronary flow Several factors contribute to cause this disproportion.[19]

The particular vulnerability of the subendocardial region of the left ventricle is due to an intramyocardial pressure gradient during contraction During systole there is a marked increase in intramyocardial pressure in the deeper layers of the left ventricle which exceeds aortic pressure and which obstructs coronary flow in this region, although there is no interference in coronary flow in the outer zone of the left ventricle or in the right ventricle or auricles where the intramyocardial pressure does not rise above the arterial pressure The subendocardial region of the septum and the left ventricle, on this account,

STAGES OF LEFT VENTRICULAR HYPERTROPHY

FIG 6

is the area most vulnerable to ischemia It is the site of predilection of myocardial disease when there is a relative insufficiency of coronary flow, as in hypertrophy, or when there is an absolute decrease in flow, as in coronary artery sclerosis and acute coronary artery occlusion This factor helps explain the infrequency of infarction and ischemic changes in the right ventricle and auricles as contrasted with the left ventricle

Over a long period, the chronic subendocardial ischemia leads to irreversible changes, and replacement fibrosis occurs This involves the Purkinje distribution network of the left bundle branch which ramifies in the subendocardial region of the interventricular septum and the left ventricle Interference with left ventricular excitation caused by diffuse involvement of the conduction system leads to slurring, notching, and widening of the QRS complex, eventually progressing to the pattern of left bundle branch block, which is frequently encountered in association with long-standing and advanced left ventricular enlargement (Fig 7) The widening of the QRS complex is only in slight part attributable directly to increased thickness of the left ventricular myocardium This is perhaps the commonest background for the development of left bundle branch block It must be emphasized, however, that bundle branch block, whether left or right, does not necessarily signify extensive heart disease, for it may result from a small scar in the conduction system, or may be due to a congenitally aberrant conduction mechanism as in the Wolff-Parkinson-White syndrome of bundle block associated with a short P-R interval

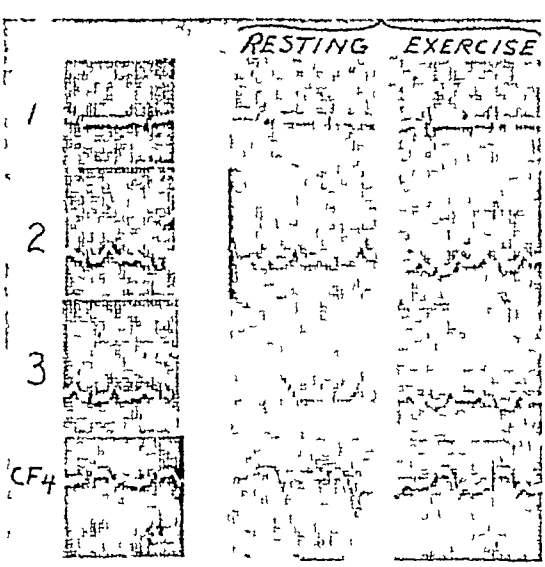


FIG 7 Effect of exercise following infarction First tracing taken on second day of acute anterior infarct. Second tracing, during convalescent stage, shows typical serial T_1 and T_4 changes Following exercise the tracing reverts to its appearance during the acute stage of infarction

Metabolic Influences on the Electrocardiogram

From this consideration of the pathogenesis of the electrocardiographic patterns of hypertrophy one sees that changes in the QRS represent structural alterations and are stable, whereas the ST segment and T wave changes are due to metabolic factors and are more variable This is a good working rule The ST segment and T wave are influenced not only by ischemia but by almost endless other metabolic factors as well, serum electrolytes (particularly potassium), acid-base balance, hormones and hormone deficiencies, toxins, and drugs, to mention only a few Consequently, one must exercise some caution in interpreting T wave changes A practical illustration of this is seen in electrocardiograms taken postoperatively where striking temporary T wave inversions develop normally during the first week or so following any type of major surgery, probably due to changes in serum potassium and acid-base balance [20] One must be very reserved therefore, in making a diagnosis of coronary occlusion or cardiac injury on the basis of such electrocardiographic changes postoperatively

One of the most important agents producing ST and T wave abnormalities is digitalis It becomes extremely difficult to make a diagnosis of myocardial ischemia or myocardial involvement if digitalis has been given, and where an electrocardiogram is to be made, it should, if possible, be taken prior to digitalization or three weeks after digitalis is discontinued, or the fact should at least be indicated that digitalis is being administered so that proper diagnosis is not confused

Apart from the effect on the ST and T, one can frequently recognize digitalis effect by the abbreviation of the ventricular complex, i e, a shortening of the QT interval The duration of the QT, which varies with the heart rate,* is an important sign to which insufficient attention has been paid It is lengthened by cardiac poisons such as quinidine and in heart disease, and it has recently been reported that this sign is of value in rheumatic carditis [21] Conversely, the QT is shortened by digitalis and calcium, both of which enhance the mechanical efficiency of the heart This effect may provide some clue to the mechanism of action of digitalis Evidence has been

* Nomograms have recently been prepared which permit direct reading of the Q-T interval corrected for heart rate [Kissin M Schwarzschild M M and Bakst H Am. Heart J 35 990 (1948) Goldberger, E *ibid* 36 141 (1948)]

The ratio $\frac{\text{duration of mechanical systole}}{\text{duration of electrical systole (QT)}}$ would appear to be a better expression of the functional integrity of the heart than the QT interval alone

presented that repolarization arrests the contractile process and that the electrical processes control the mechanical rather than the electrical [22] Inasmuch as in the failing heart there is no deficit of high energy phosphate for oxidative purposes, the action of digitalis may be related to accelerating repolarization at the muscle membrane surface as reflected in an abbreviated ST and T, rather than affecting the energy metabolism of the myocardium directly [23] In heart failure due to cardiac ischemia (and probably in myocarditis) where high energy phosphate and oxidative enzymes are affected unlike mechanical heart failure, digitalis has, as is known clinically, little beneficial effect

Coronary Insufficiency

No discussion of the electrocardiogram would be adequate without emphasizing that severe myocardial disease may exist with a perfectly normal electrocardiogram More than half of subjects with organic angina pectoris exhibit a normal electrocardiogram at rest While the coronary circulation may be adequate at rest in subjects with coronary disease, it is inadequate when the work of the heart is increased, and under these circumstances transitory electrocardiographic changes in the form of depressions of the ST segment and T wave changes very often appear which establish a diagnosis of coronary insufficiency [24] In subjects complaining of chest pain where the resting electrocardiogram is normal, examination is incomplete unless an attempt is made to induce coronary insufficiency Various forms of stress have been employed such as inhalation of low concentrations of oxygen, epinephrine and pitressin injections, and exercise. The simplest, safest, and most physiologic of these procedures is exercise A quantitative two-step test has been recommended by Master but if the steps are not available, it suffices quite well to have the patient mount a kitchen stool 20 to 30 times in one and a half to two minutes, depending on his agility and tolerance to effort.[24] Factors other than the quantitative amount of work done are important, as we know clinically from circumstances causing angina pectoris Thus, if the patient is exercised after a heavy meal or in a cold room or if he is apprehensive, the number of positive responses is greatly increased If pain develops during the performance, naturally the exercise should be stopped promptly Electrocardiographic changes usually develop before any pain occurs Tracings should be taken at brief intervals following exercise Usually such changes as develop are transitory and disappear within ten minutes It should be emphasized that changes may not be maximal or may not even be evident in the first minute after exercise but are often greatest three to five minutes after completing exercise Some caution is necessary in interpreting the result, which can be gained only by experience If there is any considerable tachycardia, it becomes very difficult to evaluate the ST segment since the isoelectric line from the end of one beat to the beginning of the next disappears Hyperventilation may produce changes indistinguishable from coronary insufficiency [25] Properly performed and interpreted the test is of great value The newer direct writing instruments are of great advantage since one can see the tracing as it is recorded

We have found application of the coronary insufficiency test quite valuable in assessing the extent of recovery and fitness to resume work in patients convalescing from coronary artery occlusion. Instead of arbitrary advice one can, with this test, evaluate whether any considerable ischemia still exists in and around the infarcted area Naturally the amount of exercise in such cases should be limited and only carried out after the acute attack has subsided and the patient is up and about Usually, we have the patient mount a stool holding him by the hand fifteen times in one and a half minutes. If recovery has been complete no changes appear but if ischemia still exists the tracing after exercise may revert back to its appearance during the initial stages of the attack (Fig 7) Under such circumstances we know that the patient requires further rest before he can undertake any extensive physical activity

Summary

Electrocardiography remains an empiric science but appreciation of fundamental factors which determine the ventricular complex is helpful in interpreting the variations which occur in health and in disease

It is shown that the ventricular complex represents almost entirely the electrical activity of the free wall of the left ventricle and that the right ventricle and the interventricular septum normally contribute but negligibly to the electrocardiogram. The derivation of the standard limb leads and the effect of positional variations of the heart are described as well as certain major abnormalities such as infarction and coronary insufficiency, hypertrophy, bundle branch block, and metabolic influences on the electrocardiogram. The relation of the standard limb leads to the unipolar limb leads is discussed, and it is emphasized that unipolar leads offer little advantage over the standard leads except in differentiating the normal from the pathologic Q_3 deflection. The conventional CF precordial leads likewise suffice for routine clinical purposes and are somewhat more apt to exhibit abnormali-

ties than the CR or V leads However, since CF leads occasionally exhibit spurious abnormalities particularly in children and slender subjects, V leads may be preferable Under special circumstances further leads may be helpful, such as the CR_2 lead (which records the auricular potential particularly well) in analysis of arrhythmias and a back chest lead in certain cases of posterior infarction Serial precordial leads are valuable in mapping out the extent of infarction It is emphasized that the electrocardiogram has prognostic was well as diagnostic value in acute coronary occlusion

PRIZE ESSAYS

The Merrit H Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 2, 1949, in Buffalo

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York

The Merrit H Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of a prize, it will not be awarded

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct"

All essays must be presented not later than February 1, 1949, and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York.

ARMITAGE WHITMAN, M D, *Chairman*
Committee on Prize Essays

A GUIDE TO THE USE OF PROCAINE PENICILLIN IN HOSPITAL PRACTICE

GENE H STOLLERMAN, M D , EDWARD H ROSTON M D , and BEATRICE TOHARSKY, M A , New York City

(From the Medical Services and the Division of Bacteriology of Mount Sinai Hospital)

UNTIL recent months crystalline penicillin G was employed routinely in hospitals for the control or prevention of certain bacterial infections, usually by intermittent intramuscular injections every three hours Penicillin administered orally, while of some value in home therapy and particularly in pediatrics, is still too irregular in its absorption from the gastrointestinal tract for the treatment of the usual hospital case Moreover it requires about five times the parenteral dose and is consequently more expensive and wasteful. Penicillin-in-oil-and-beeswax (Romansky formula) produces consistent therapeutic blood levels for at least twelve hours when 300,000 units are given by intramuscular injection.[1] With this preparation, the need for repeated injections is reduced in frequency from three-hour to twelve- or twenty four hour intervals This preparation, however, has proved to be less efficient and less convenient in our hands than the newer repository penicillin products, because of more frequent irregularities in absorption from the intramuscular depot and occasional violent reactions due to allergy to the beeswax [2–5]

The obvious advantages of single daily injections of penicillin for routine hospital therapy can be secured by the intramuscular administration of procaine penicillin Carefully controlled experience on hundreds of patients has shown this product to be so reliable in the constancy and duration of effective therapeutic blood levels that we now employ it almost exclusively as a substitute for crystalline penicillin G It is relatively simple to administer and well tolerated by patients It is no more expensive to use than crystalline penicillin, and as one daily injection is required as a rule, there is a large saving in precious nursing labor and in equipment

Procaine Penicillin Products

Procaine penicillin is a sparingly soluble salt which is prepared by the chemical combination of procaine and penicillin G It is available commercially suspended either in water or various vegetable oils Usually 1 cc. contains 300 000 units of penicillin in chemical combination with approximately 125 mg of procaine base Its actual penicillin potency is 940 units per mg In most of the commercially available preparations at least 50 per cent of the particles in the water or oil suspension have a length of 50 or more microns By virtue of its particle size and sparing solubility, procaine penicillin is slowly absorbed by the tissues and thereby produces a prolonged blood level for twenty four hours or more

Even more prolonged blood levels (up to ninety-six hours or longer) can be obtained by the injection of procaine penicillin in oil gelled with aluminum monostearate to delay absorption further Presumably, this exerts its effect by coating the individual procaine penicillin particles and thereby making them water-repellent While it has been assumed that the large size of the procaine penicillin particles in other procaine penicillin preparations plays an important role in delaying absorption from the usual water or oil menstrua, investigators have reported recently that a small particle size of procaine penicillin is preferable when used with aluminum monostearate, because more of the antibiotic is coated and absorption is therefore, delayed even more effectively [6] Most of the procaine penicillin particles in the aluminum monostearate preparations are under 2 microns and practically all are under 5 microns in length Procaine penicillin with aluminum monostearate is available only in oil

Since the introduction of these improved products, we have used most of the procaine penicillin preparations available commercially in several thousand individual injections, both in water and in oil suspensions. In addition, we have used a variety of oil menstrua (sesame oil hydrogenated peanut oil, hydrogenated peanut oil with pectin) Very little individual difference has been noted among the various products as to blood levels over a twenty four hour period, following a single intramuscular injection All have been found to be extremely well tolerated as to local reaction, pain and systemic reaction. In our extensive experience we have not yet encountered any instance of procaine sensitivity although we have been informed of two cases of dermatitis after two weeks of therapy on daily doses of 600 000 units [6]

The oil suspensions are exceedingly stable and may be stored without refrigeration for an indefinite period It is most important that the syringe and needles used for their administration be completely dry and, after usage, thoroughly cleansed with detergents or fat solvents. In giving an intramuscular injection, it is also important to avoid accidental intravenous administration in

order to avert an oil embolus, as with any other oil preparation [7] For this reason injections of procaine penicillin in oil are administered in our institution only by physicians Since the patients usually require only one injection per day, this is not an arduous task

Aqueous suspensions are made up by adding distilled water or isotonic saline to the stable dry salt This suspension may be kept at room temperature for one week without deterioration Intravenous injection should be carefully avoided However, we have given up to 1 cc intravenously to dogs without any untoward reactions In sacrificed animals, microscopic sections of the organs revealed that some of the larger particles of procaine penicillin had lodged in lung capillaries, but they had not given rise to any local inflammatory reaction and had not interfered with the pulmonary circulation As a result of these experiments and several months of clinical trial on several hundred patients, we feel that the possibility of accidental embolization with the aqueous suspension is minimal and that the hazard, if it should occur, is negligible Nurses are, therefore, permitted to administer these preparations in our hospital

It is important to emphasize that all preparations of procaine penicillin, oil and aqueous, and particularly the latter, must be vigorously shaken for thorough dispersion immediately before being drawn up into the syringe, and then promptly administered before settling of particles can take place in the syringe and needle If this is done, the aqueous suspension can be administered as easily as the oil preparations, and the annoying tendency for the particles to adhere to one another and to the wall of the syringe and needle can be avoided Needles of 20 gauge or larger are recommended

Blood Levels Obtained with Intramuscular Procaine Penicillin

We have determined penicillin serum concentrations after intramuscular injections of procaine penicillin in over 200 hospital cases The method of penicillin assay employed was a "broth dilution method" using Staphylococcus aureus H as the test organism and beef infusion broth as the medium, as described in detail by King, Schneierson, *et al* [8] Tables 1 and 2 summarize the most pertinent portion of our data

TABLE 1 —PENICILLIN BLOOD LEVELS FOLLOWING A SINGLE INTRAMUSCULAR INJECTION OF PROCAINE PENICILLIN IN AQUEOUS OR OIL MENSTRUA

Dose	Hours	Number of Patients	Average Penicillin Level in Oxford Units per cc of Serum	Percentage of Patients with Level of 0 05 Unit or Higher
300 000 units	1	9	1 46	100 0
	2	9	1 62	100 0
	3	9	1 44	100 0
	4	9	1 35	100 0
	8	9	0 85	100 0
	12	130	0 60	98 6
	24	128	0 20	81 8
	36	59	0 12	76 7
	48	11	0 05	62 7
600 000 units	2	5	1 97	100 0
	12	7	0 99	100 0
	24	5	0 35	100 0

TABLE 2 —PENICILLIN BLOOD LEVELS FOLLOWING A SINGLE INTRAMUSCULAR INJECTION OF PROCAINE PENICILLIN (SMALL PARTICLE) IN OIL WITH 2 PER CENT ALUMINUM MONOSTEARATE

Dose	Hours	Number of Patients	Average Penicillin Level in Oxford Units per cc of Serum	Percentage of Patients with Level of 0 05 Unit or Higher
300 000 units	1	6	0 25	100 0
	24	6	0 21	100 0
	48	6	0 17	100 0
	72	6	0 07	100 0
	96	6	0 06	83 3
	120	6	0 04	66 7
600 000 units	1	6	0 35	100 0
	24	6	0 16	100 0
	48	6	0 19	100 0
	72	6	0 15	100 0
	96	6	0 07	83 3
	120	5	0 08	80 0

These results were obtained with a variety of commercial procaine penicillin products and are tabulated together, since little significant difference in blood levels could be detected when products from the various pharmaceutical firms were employed * These figures demonstrate that a single dose of 300,000 units given intramuscularly will sustain a good therapeutic blood level of penicillin (above 0 05 unit) in virtually all individuals for twelve hours and in over 80 per cent for twenty-four hours Doses of 150,000 and 200,000 units of procaine penicillin frequently provide adequate blood levels for twelve and even twenty-four hours However, more frequent exceptions are encountered than when 300,000 units are used to produce the daily depot, and, therefore, lower doses are not recommended for adults

The blood levels obtained after the intramuscular administration of 600,000-unit doses are in accord with the observations of other authors [9] They demonstrate that by this dosage the percentage of effective therapeutic blood levels at twenty-four hours (above 0 05 unit per cc) can be raised to practically 100 per cent We have observed that the blood levels do not necessarily increase arithmetically with the dosages, as one can expect with crystalline penicillin G [10]

* For these studies procaine penicillin preparations were generously provided by Schenley Laboratories (procaine penicillin in oil and procaine penicillin in oil with aluminum monostearate), E R. Squibb and Sons (procaine penicillin aqueous Crysticillin), and by Eli Lilly and Co (procaine penicillin in oil Duracillin) In addition a series of observations were made with preparations from several other manufacturers

For instance, 150,000 units provide twelve-hour levels considerably higher than the predicted one half of the corresponding 300,000-unit level The 300,000-unit level is in turn about two thirds rather than one half that of the 600,000-unit blood level It would seem that absorption is delayed with an increasing dose in a single depot. However, blood levels as high as 5 units in six hours and 4 units in twenty-four hours have been reached with 3 000,000 units (10 cc given as one 5-cc dose in each buttock) Following this dose, penicillin was no longer detectable in the blood on the third day (This is in contrast to the results obtained with much lower doses of preparations containing aluminum monostearate as is discussed below) Much beyond this dose, therapy becomes less practical, necessitating multiple injections or a volume of fluid large enough to cause the patient considerable discomfort when injected intramuscularly In addition, we do not have sufficient data as yet relative to the possible adverse effects of a high accumulation of procaine in the serum, and until this is available it is inadvisable to go any higher in dosage.

Maximum blood levels with procaine penicillin in aqueous and oil menstrua are reached within one to two hours However, this peak is much lower than is observed in ten or fifteen minutes after a corresponding dose of crystalline penicillin G, and it falls off at a much slower rate One hour after an intramuscular injection of 300,000 units of crystalline penicillin G, the blood level has usually dropped to the level observed, as a rule, twelve hours after the same dose of procaine penicillin

The procaine penicillin preparations which contain aluminum monostearate are absorbed still more slowly and uniformly Consequently the peak levels are even lower but the maintenance of an effective therapeutic blood level is considerably longer (Fig 1) After an intramuscular dose of 300 000 units of procaine penicillin (small particle) in peanut oil with 2 per cent (weight/volume) aluminum monostearate, the average blood level after the first hour is 0.25 unit compared with 1 46 units produced by procaine penicillin suspended in either oil or aqueous menstrua The level does not drop below 0 05 unit for at least ninety-six hours in the vast majority of cases and therapeutic levels of this range are frequently maintained for as long as one hundred twenty hours Larger doses of this preparation do not produce commensurately greater peak levels but provide a relatively constant prolonged level at a higher plateau over the course of at least four or five days Thus, 600 000 units of procaine penicillin with aluminum monostearate produce a blood level of 0.35 unit one hour after intramuscular injection, and a therapeutic level is maintained for five days in four out of five patients studied In one patient given an injection of 3,000,000 units (ten times the usual therapeutic dose), the blood level at one hour was raised only to 1 3 units (five times the expected level from an injection of 300 000 units of the same preparation) Seven days after this injection the patient still had a blood level of 0 1 unit This same patient had previously been studied after an injection of 3,000 000 units of procaine penicillin in aqueous suspension (see above) and was found to have much higher peak levels (5 units in one hour) but no detectable penicillin blood level in seventy two hours It is, therefore apparent that very high blood levels are not easily achieved by the employment of procaine penicillin with aluminum monostearate but that the levels attained can be greatly prolonged

It is of interest that blood levels do not seem to reflect a cumulative effect when the intramuscular administration of procaine penicillin in aqueous or oil suspension is repeated daily or twice a day In five patients receiving between 300 000 and 600,000 units every twelve hours, in whom blood levels were determined at twelve hours and then every twenty four hours for as long as twenty four days a progressive rise beyond the initial twelve-hour level was not observed However peak levels occurred one to two hours after each injection, so that the average level through an entire twenty four-hour period was higher when the injection was repeated every twelve hours than when the dose was given once a day The failure to achieve a cumulative increase in the twenty four hour determination during successive days after daily intramuscular injections can also be observed in the data of other authors who have given daily injections of procaine penicillin with aluminum monostearate, in spite of the fact that therapeutically effective blood levels persist

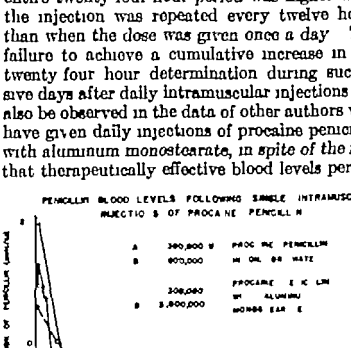

FIG 1

ninety-six hours or more after a single dose This phenomenon deserves further study for verification

While our data on pediatric dosage is still limited, we have found in 21 infants, weighing from 5 to 25 pounds, that an intramuscular injection of 150,000 units of procaine penicillin in aqueous or oil suspension without aluminum monostearate provides a therapeutically adequate blood level at twelve hours and in 14 out of 15 patients at twenty-four hours This dosage seems to be well tolerated by infants

Recommendations for Penicillin Therapy in Hospital Practice

1 Dosage of Procaine Penicillin —A daily intramuscular injection of 300,000 units of procaine penicillin in aqueous or oil suspension is therapeutically adequate in most common infections caused by organisms which are penicillin-sensitive For organisms which are only moderately sensitive to penicillin (coefficient of resistance five or more times that of the standard Staphylococcus aureus H), the dose should be 600,000 units once or twice a day Table 3 lists these organisms and their usual in vitro sensitivity

TABLE 3 —RANGE OF IN VITRO SENSITIVITY OF BACTERIA TO PENICILLIN

Bacteria	*Penicillin Units* per cc of Serum
Staphylococcus aureus	0 02 –4 0
Streptococcus hemolyticus Group A	0 01 –0 1
Green streptococci (viridans)	0 02 –0 4
Enterococci Group D (Str fecalis)	0 1 –7 4
Neisseria meningitidis	0 02 –0 04
Neisseria gonorrhea	0 01 –0 02
Diplococcus pneumoniae	0 005–0 05

When using procaine penicillin in oil with aluminum monostearate, the doses may be spaced several days apart Studies on the clinical response to various doses of procaine penicillin with aluminum monostearate administered at varying intervals are now in progress From our experience to date it would appear that this preparation will be extremely useful for the treatment of infections due to bacteria with a resistance of 0 1 unit or less, since injections of doses up to 3,000,000 units can achieve this level and maintain it for practically one week For the present, however, it is best to employ a daily dose schedule rather than to depend upon a single intramuscular injection of procaine penicillin with or without aluminum monostearate

2 Identification of Bacterium and Determination of Its Resistance to Penicillin —Because of the consistent predictability of adequate therapeutic blood levels at twenty-four hours after the intramuscular injection of the recommended doses of procaine penicillin, blood level determinations are no longer necessary as a guide to treatment However, it is as important as ever to identify the bacterium in every instance of infection and to determine its relative resistance to penicillin (or streptomycin), so that an adequate daily dose of procaine penicillin may be given

3 Administration —Procaine penicillin in a water suspension may be administered by nurses, but they should be instructed to shake the mixture thoroughly and then to administer it promptly so as to avoid clogging of the needle Procaine penicillin in oil, as with any other oil preparation is best administered by a physician because of the remote danger of oil embolism To economize on labor, it is desirable to make all injections of procaine penicillin on a ward at one time of the day

4 Therapeutic Response —The therapeutic response to penicillin in vivo does not always parallel the in vitro sensitivity of the organism [11] Also, successful treatment is not always dependent on the maintenance of a constant blood level at a range which is usually curative for most organisms of the same relative sensitivity It is, therefore, also necessary to evaluate the dosage in each patient on the basis of clinical response

5 Single Dose Therapy —Twenty-three cases of bacterial pneumonia have been treated by Boger and his associates with a single intramuscular dose of procaine penicillin in oil [4] Eleven cases received 300,000 units, and 12 cases received 600,000 units in one injection While a surprisingly high number of excellent clinical responses occurred, there were several relapses in each series

6 Syphilis and Gonorrhea —The treatment schedule with procaine penicillin in certain infections, such as syphilis, has not yet been determined definitely In primary and early secondary syphilis, 300,000 units of procaine penicillin in water or oil suspension daily for ten days or 300,000 units of procaine penicillin with aluminum monostearate every other day for the same period would seem to be adequate for most cases For late secondary and tertiary syphilis and for cerebrospinal lues, more prolonged or repeated schedules of therapy may be required A single injection of 300,000 units of procaine penicillin with or without aluminum monostearate should be adequate for the cure of gonorrhea

7 Subacute Bacterial Endocarditis —Subacute bacterial endocarditis, when due to susceptible organisms of average penicillin resistance (one to three times the resistance of the standard strain of Staphylococcus aureus H), can be treated with 600,000 units of procaine penicillin given once daily for six to eight weeks For endocardial infections due to bacteria with a penicillin resistance five or more times that of the standard strain of Staphylococcus aureus H, this dose should be re-

peated twice a day for six to eight weeks It is important to emphasize that the duration of treatment cannot be shortened by increasing the dosage King *et al.* have given massive doses of crystalline penicillin G, 14,000 000 units a day (1,000 000 units intravenously every hour for ten hours and 1,000 000 units intramuscularly four times a day), and have administered 4 Gm. of caronamide every four hours during this period to retard renal excretion of penicillin. In spite of blood levels of 5 to 460 units during this period, we failed to cure seven out of eight cases of subacute bacterial endocarditis due to penicillin sensitive strains of Streptococcus viridans Four of the seven cases that relapsed on this regimen of massive therapy were subsequently cured by a second course of treatment over a longer period of time (six to eight weeks) with much smaller doses (100,000 units of crystalline penicillin G every three hours or 450 000 to 600,000 units of procaine penicillin twice a day) Of the three remaining cases, two are still under treatment, and one died of cardiac failure with active endocardial infection still present [12]

Procaine penicillin with aluminum monostearate will undoubtedly find use in the therapy of this disease as blood levels are prolonged for several days, within the therapeutic range for the usual strain of Streptococcus viridans, following a single intramuscular injection However, it should be emphasized that this preparation may have limitations in that blood levels, although more prolonged, do not show the peaks observed following injections with crystalline penicillin G and to a lesser extent following injections with procaine penicillin in water or oil menstrua It has been emphasized that these "peaks," especially as obtained with "booster" doses of penicillin, may assume importance when dealing with deep-seated foci of infection [13]

8 Prophylaxis.—For the prevention of infection at the time of surgical operations, tonsillectomies, and dental extractions an injection of 300,000 units of procaine penicillin once a day for one or more days is adequate.

9 Crystalline Penicillin Versus Procaine Penicillin.—There are now relatively few indications for the use of crystalline penicillin G In rare cases where sensitivity may develop to procaine, the usual intermittent intramuscular injections of crystalline penicillin every three hours around the clock are indicated In infections due to highly resistant organisms, with a coefficient greater than 20 times the resistance of the standard organism, it is probably safer to use crystalline penicillin by intramuscular or intravenous doses to maintain the desired blood level and to secure extraordinary high peaks of blood level repeatedly during the day At least until further experience is available concerning the possible toxic effects of procaine liberated from large doses of procaine penicillin, this should be the method of choice The desired intramuscular dose of crystalline penicillin may be determined by reference to the tables for serum concentrations following various doses which have been published [10 13] In overwhelming infections an initial "booster" dose may be given intramuscularly or intravenously at the time procaine penicillin treatment is started so that a high blood level may be achieved immediately Such "booster" doses of crystalline penicillin may be repeated advantageously twice a day if the organisms are relatively resistant or if penetration into dense foci of infection is required

There is evidence that procaine may inhibit the action of sulfonamides in infections.[14] Studies are in progress to determine whether sufficient procaine is liberated from procaine penicillin to produce this effect Until this is definitely known, crystalline penicillin is to be preferred in infections in which simultaneous treatment with sulfonamides is indicated

Crystalline penicillin is, of course, required for the preparation of solutions for topical application, intrathecal intrapleural, intra-abdominal, intra-articular, intratracheal, and antral instillations in the preparation of aerosols and in oral preparations

The number of people over forty developing tuberculosis having had a recent normal chest film, indicates that no age is immune from tuberculosis.—*Exchange*

ELUSIVE MENTAL CASES

The Epileptic Personality

B LIBER, M D , F A P A , New York City

(From the Mental Hygiene Clinic, New York Polyclinic Hospital)

SOMETIMES it is difficult to know which condition is the cause and which the effect of an illness

Epilepsy is supposed to be characterized not only by the well-known specific seizures but also by a peculiar epileptic mentality, consisting of a tendency to seclusiveness, irritability, excessive sensitivity, to being temperamental, and to a great difficulty for the patient to adjust himself socially This mental state is called the epileptic disposition or the epileptic personality However, from the psychiatric point of view it is often impossible to determine whether the character of these patients is an inherent and inseparable part of their disease, one of its symptoms, a concomitant mental state without which this illness would not exist, or a consequence of the convulsive attacks and the maladjustment created by them In the trivial cases, we are rather inclined to the latter conclusion

Two unrelated young men of approximately the same age, about twenty-four, seemed to be normal The groups in which they mingled regarded them as "healthy guys" who happened to be "funny" ("There is nothing the matter with them, except they are queer") Nor did the average physician find anything out of the ordinary in them unless he was told of their fits They were accepted for the military service and served a short time, both being incapacitated by small but temporarily disabling wounds There was no war neurosis

At about the age of ten or twelve they began to suffer from minor lapses of consciousness of short duration and at irregular intervals The patients were aware of the attacks only after observers reported them If spasms or convulsions occurred, they were not noticed by any members of the respective families

From time to time other forms of the disorder, epileptoid absences or epileptic equivalents, seemed to thrust themselves into the memory or consciousness of these patients or were mentally reconstructed, more by logical reasoning than by actual knowledge Some authors call such states oneiric or oneiroid—brief waking dreams, as it were Others regard them as crepuscular or twilight conditions, but to this observer they appear to be completely empty and to contain none of the dream elements and no mental experiences The impression is that of a total blankness, a momentary but real abstraction and withdrawal of the mind from any fact, person, or object, or perhaps even the nonexistence of mind

For instance, during a conversation, there would be a short interruption and then a correct continuation of the speech Perhaps only one or two words were omitted, but they were not missed by the interlocutor, who probably understood the whole sentence and was hardly aware of the phenomenon Nor did any change of the body position take place On the contrary, in the critical moment the patient was motionless, and his eyes showed a glassy gaze or stared fixedly into space until familiar gesticulations and sounds returned

Many of the more outstanding attacks of unconsciousness were of the nocturnal type They were often observed by the parents because the patients would awaken worn and haggard, with no understanding of where they were One of the men, in addition to the many petit mal fits, had twice had typical grand mal seizures, confirmed by a good description made by an intelligent and reliable informant

These patients with an externally normal appearance were not always slow or mentally deteriorated, as they are sometimes described by other observers Up to the age of sixteen or seventeen they were bright and wide awake, interested in their surroundings, and full of hope for their own futures About that time a change gradually developed, but it was not a lowering of their intelligence On the contrary, the keener they became, the more they were convinced that they were fighting a losing battle

Fighting? For a long time, they were unaware of any hostility anywhere They had both been excellent students in high school, although they had instinctively avoided the sports and the games A mental depression appeared, and both boys tried to drown it or cover it up with new activities, each in a different manner They vaguely felt some social obstacles in their way X began to drink and to make merry with other young men—never with women Y plunged into reading—usually abstruse philosophic and mathematical works The latter grew indifferent to sex and uninterested in any gainful occupation Secretly, the former burned with a passion for

girls, and, contrary to the impression one may have had from the circle with which he associated in his spare time, he was averse to homosexualism. In fact, he was a woman's man, but he was afraid of the female sex Being conscious of his condition, he was timid

And now, something else happened He who had masturbated from time to time in a fully conscious state began to do so several times a day and furiously Moreover, intimate witnesses assured us that of late he regularly abused himself while under his epileptic fit and as the spell was usually extremely short, his sexual misuse of himself was mostly abortive This might have suggested another diagnosis in his case perhaps his attacks were of a hysteric instead of an epileptic nature but in view of his past history and of the findings of an electroencephalographic examination, his malady had to be classified in the previously accepted category

He was a jeweler but refused to work at his trade in a shop where, he believed, others might watch him and perhaps discover his attacks, which, by the way, had never been seen by anybody outside his family He was satisfied with an easy laboring job, performed at night, when, as he said, there were but few people around

As to Y, his complex forced him into a bolder quasiparanoic state He suspected people of suspecting his trouble He was sure to fail at anything that he might undertake He could have functioned as a fine draftsman as he had done before he lost confidence in himself As long as his parents were willing to feed him, he preferred not to leave the house.

Several physicians had tried their hands in both these cases. The ketogenic diet, low carbohydrate and high fat intake, bromides phenobarbital, and dilantin sodium had not been successful Tridione seems to have some favorable effect on the elusive spells, but it is too early to be certain At any rate, it is no more a real cure than any of the drugs that have been used in the various epileptic forms for centuries

In a third and similar case, the patient was saturated and mentally confused through over doses of the usual medication The removal of all the drugs had the effect of bringing back the petit mal attacks more frequently, but the mind cleared up beautifully, while the thinking process improved greatly

A fourth man was mistakenly placed at Craig Colony, a New York State hospital for the more advanced and somewhat degenerated mental cases He became discouraged and unhappy in that environment and broke down mentally His symptoms, those of a manic depressive psychosis, depressed type disappeared after his release from the institution There was no sign of this condition before his admission, and after his return home, he was soon rehabilitated and resumed a useful life

The fact to be emphasized in these extremely light cases and in many others seen by this writer is that none of them presented a real and demonstrable "epileptic personality" Whenever a complicating mental disturbance occurred, it was rather of the irregular behavior type and was induced by the circumstances of the ailment and by the patients' awareness of it The mental problem was always secondary to the seizures and to the feeling of inferiority created by them. The mechanism resembled other frustrations of a more or less serious nature Psychotherapy was invariably helpful as far as the mental disorder was concerned

65 WEST 95TH STREET

SURGEONS PRAISE BONE BANK

The fact that bone may be preserved in a frozen state for weeks and is of definite value in bone-grafting operations has been acclaimed by Leonard F Bush M.D., of Danville, Pennsylvania, and C Zent Garber, M D of New York, in a recent issue of the *Journal of the American Medical Association*

The doctors first experimented successfully on large chinchilla rabbits, using bone which had been kept in a deep freeze cabinet at minus 20 to 30 C for as long as 84 days. With no complications in these operations, they attempted using it in human patients.

For comparative purposes they used outside bone in operations on 104 patients under three different methods. Twenty four of these operations were by direct transfer from the donor to the patient in 37 cases, the bone was kept under refrigeration at plus 2 to plus 5 C and in 43 of the operations, the bone had been stored in a deep freezer There were only four complications in all 104 cases.

The surgeons pointed out that the possibility of having a large supply of frozen bone available might be an important aid in many operations It was pointed out that, while a bone bank on a small scale is desirable in every hospital which has an active bone and joint service there are great possibilities for further development of large bone banks to supply the needs of surgeons in each community for bone transplants of every size and description So bone banks may soon be joining eye banks in the reserves which medical science is setting up to protect the health of all

ELUSIVE MENTAL CASES

The Epileptic Personality

B Liber, M D , F A P A , New York City

(From the Mental Hygiene Clinic, New York Polyclinic Hospital)

SOMETIMES it is difficult to know which condition is the cause and which the effect of an illness

Epilepsy is supposed to be characterized not only by the well-known specific seizures but also by a peculiar epileptic mentality, consisting of a tendency to seclusiveness, irritability, excessive sensitivity, to being temperamental, and to a great difficulty for the patient to adjust himself socially This mental state is called the epileptic disposition or the epileptic personality However, from the psychiatric point of view it is often impossible to determine whether the character of these patients is an inherent and inseparable part of their disease, one of its symptoms, a concomitant mental state without which this illness would not exist, or a consequence of the convulsive attacks and the maladjustment created by them In the trivial cases, we are rather inclined to the latter conclusion

Two unrelated young men of approximately the same age, about twenty-four, seemed to be normal The groups in which they mingled regarded them as "healthy guys" who happened to be "funny" ("There is nothing the matter with them, except they are queer") Nor did the average physician find anything out of the ordinary in them unless he was told of their fits They were accepted for the military service and served a short time, both being incapacitated by small but temporarily disabling wounds There was no war neurosis

At about the age of ten or twelve they began to suffer from minor lapses of consciousness of short duration and at irregular intervals The patients were aware of the attacks only after observers reported them If spasms or convulsions occurred, they were not noticed by any members of the respective families

From time to time other forms of the disorder, epileptoid absences or epileptic equivalents, seemed to thrust themselves into the memory or consciousness of these patients or were mentally reconstructed, more by logical reasoning than by actual knowledge Some authors call such states oneiric or oneiroid—brief waking dreams, as it were Others regard them as crepuscular or twilight conditions, but to this observer they appear to be completely empty and to contain none of the dream elements and no mental experiences The impression is that of a total blankness, a momentary but real abstraction and withdrawal of the mind from any fact, person, or object, or perhaps even the nonexistence of mind

For instance, during a conversation, there would be a short interruption and then a correct continuation of the speech Perhaps only one or two words were omitted, but they were not missed by the interlocutor, who probably understood the whole sentence and was hardly aware of the phenomenon Nor did any change of the body position take place On the contrary, in the critical moment the patient was motionless, and his eyes showed a glassy gaze or stared fixedly into space until familiar gesticulations and sounds returned

Many of the more outstanding attacks of unconsciousness were of the nocturnal type They were often observed by the parents because the patients would awaken worn and haggard, with no understanding of where they were One of the men, in addition to the many petit mal fits, had twice had typical grand mal seizures, confirmed by a good description made by an intelligent and reliable informant

These patients with an externally normal appearance were not always slow or mentally deteriorated, as they are sometimes described by other observers Up to the age of sixteen or seventeen they were bright and wide awake, interested in their surroundings, and full of hope for their own futures About that time a change gradually developed, but it was not a lowering of their intelligence On the contrary, the keener they became, the more they were convinced that they were fighting a losing battle

Fighting? For a long time, they were unaware of any hostility anywhere They had both been excellent students in high school, although they had instinctively avoided the sports and the games A mental depression appeared, and both boys tried to drown it or cover it up with new activities, each in a different manner They vaguely felt some social obstacles in their way X began to drink and to make merry with other young men—never with women Y plunged into reading—usually abstruse philosophic and mathematical works The latter grew indifferent to sex and uninterested in any gainful occupation Secretly, the former burned with a passion for

be referred to Dr Van Etten and received a courteous reply without any comment Then he sent it to Dr Conway who was interested and thought perhaps the State Medical Society would care to have the problem explored

It was voted that the Council refer the matter of future changes in the Workmen s Compensation Minimum Fee Schedule to the Workmen s Compensation Bureau with the hope that a yardstick will be evolved.

Meetings.—Since the June meeting of the Council, your Secretary has endeavored to perform his duties as specified by the Constitution and Bylaws He has notified members of your committees and subcommittees of their appointments He has answered correspondence and has attended three meetings outside New York City, the American Medical Association House of Delegates in Chicago, the Annual Meeting of New York State Health Officers at Saratoga, and a meeting of the Blood Bank Subcommittee of the Public Health and Education Committee in Albany

The August 9, 1948, Secretary's Letter from Dr George F Lull, Secretary and General Manager of the American Medical Association, states in part

CHANGE METHOD OF SELECTING GENERAL PRACTITIONER

With more and more attention being directed to the second annual A.M.A. Interim meeting to be held in St. Louis, November 30 to December 3 1948 attention is called to the resolution adopted by the House of Delegates at the Chicago session in June changing the method of selecting the outstanding general practitioner of the year The selection is made at the Interim Session.

The resolution, which was introduced by Dr E. S. Hamilton in behalf of the Illinois State Medical Society set out that the first award was made at the A M.A meeting in Cleveland last January, but was "marred by confusion and misunderstanding." The resolution said it was desirable to set up some definite procedure for the selection of the A.M.A. general practitioner of the year recommending that the selection originate at the county society level and proceed through state organizations so that local or state groups and individuals may pay tribute to the family physician of their choice

The resolution set in operation the following plan

1 Each county medical society shall be urged to name the candidate of its choice as the outstanding general practitioner for the year within its jurisdiction, basing its selection on nominations and recommendations from any responsible source lay or professional

2. The name of each candidate so chosen by a county medical society with all pertinent data, including recommendations of lay groups and individuals, shall be submitted by the county medical society to the state medical society of which it is a component part.

3 Each state medical society through whatever agency each may designate, shall select from among the candidates submitted by its component county medical societies one name to be declared the outstanding general practitioner within the state.

4. The candidate so selected at the state level shall be the sole candidate from that state, and his or her name with all pertinent supporting data shall be submitted to the Board of Trustees of the American Medical Association

5 The Board of Trustees shall select from the names submitted by state societies the names of three persons these names to be submitted in turn to this House of Delegates which shall select one name to be declared the outstanding general practitioner of the United States for the year

6 Any state medical society desiring to do so may establish and confer a suitable award, with fitting public ceremony on the physician it has named as the outstanding general practitioner of that state for the year

It is respectfully suggested that this matter be referred to the Medical Service Committee consisting of Dr Harry Aranow, chairman Dr Carlton E Werts, and Dr Laurance D Redway

In accepting the Report of Reference Committee on Report of Council Part V. Workmen s Compensation, the House of Delegates recommended approval in part as follows

We believe that the fees as promulgated on June 1, 1947 are inadequate in view of the present increased costs of living and of conducting medical practice We, therefore recommend that the Chairman of the Workmen s Compensation Board arrange for a yearly consideration and review of the fee schedule to bring it in line with the prevailing rates for medical service throughout the State of New York

The Secretary takes the liberty to recommend that the Council request the Workmen s Compensation Committee to take cognizance of this action of the House of Delegates.

It was voted that the report be accepted and recommendations adopted

Dr Anderton presented the following supplementary report which was adopted

The Secretary absented himself from the office for two weeks commencing Monday August 16, with the exception of one day On August 17 he attended part of the Convention of the Disabled Veterans Association and conferred with Dr Clayton Wood medical director Dr Wood agreed to include in his speech to the Association the fact that practicing physicians are eligible to care for service-connected disabilities when veterans insist.

The schedule of district branch meetings has been completed, thanks to Dr Hannon. They will be held according to the schedule published in the NEW YORK STATE JOURNAL OF MEDICINE August 15

Also your Secretary attended a meeting at the Grand Central Palace last week called by the Mayor and Mr Grover Whalen in regard to public education about atomic energy In that connection it gives me pleasure to commend very highly to you the exhibition now on the fourth floor of Grand Central Palace which portrays the theory of atomic energy in a very understandable way The Westinghouse Electric Company has a ten-minute lecture at half past every hour during the day and it is worthwhile going to the fourth floor to hear

It gives me pleasure to draw to your attention the fact that the magazine *Vital Speeches of the Day* of August 15 1948, contained an article entitled "The Doctor and Public Health, The Necessity of Blood Banks in this Atomic Age," by Dr Leo F Simpson

Treasurer's Report was accepted

Report of the Executive Officer

Dr Hannon executive officer reported verbally as follows

The arrangement and programs of the eight district branch meetings as the secretary has stated have been published in the JOURNAL. These meetings start next week and we will have a busy time for the next six weeks.

There was a meeting of the Legislative Committee last evening in this office We regret that Dr Aranow through illness could not attend but the meeting covered a great deal of material, and on the basis of the actions taken the members of the Committee and myself can go to work toward next year's legislation The actions of that committee necessitate that I take up with the various State departments the type of bill they desire to be presented next year at the legislature.

Reports of Committees

Constitution and Bylaws.—In the absence of Dr Reuling chairman, Mr Clearwater reported that the Medical Society of the County of Rockland had submitted a complete new constitution and bylaws The Medical Society of the County of Ontario sub-

mitted for consideration a new provision in their bylaws The Medical Society of the County of New York submitted an addition to their bylaws

It was voted to approve the alterations in the proposed new constitution and bylaws of the Medical Society of the County of Rockland, redrafting of the proposed alterations in the bylaws of the Medical Society of the County of Ontario, and the addition to the bylaws of the Medical Society of the County of New York

Convention —The report of the Convention Committee, Dr Aranow, chairman, was adopted as follows The 142nd Annual Meeting of the Medical Society of the State of New York was held at the Hotel Pennsylvania in New York City from May 17 through 21, 1948

Attendance —Over 6,000 registrations were recorded as follows physicians 4,396, guests 874, and exhibitors 750, making a total of 6,020

The physician registration numbered almost 3,700 members of the Medical Society of the State of New York, and the balance, nonmember physicians from many other parts of the globe The guests, for the most part, were dietitians, medical technicians, registered nurses, and others working closely with the medical profession

Scientific Program —Approximately 125 papers were read at the scientific meetings The Teaching Day program, arranged by Dr O W H Mitchell, was well attended The General Sessions, presided over by Dr Duncan W Clark, were filled to overflowing Many of the section meetings were conducted with part of the audience standing in the rear Only the physical limitations of the meeting rooms prevented larger attendance

Scientific Exhibits —Seventy exhibits, many of outstanding scientific value, drew a constant stream of physicians and much favorable comment The Scientific Award Committee gave a first prize, a second prize, and honorable mention in two classes—clinical research and scientific research Appropriate plaques were awarded to the winning exhibits by Dr J G Fred Hiss, chairman of the Scientific Exhibits *

Technical Exhibits —The large attendance of doctors and their interest in the attractive technical exhibits was appreciated by the exhibitors

Scientific Motion Pictures —The motion picture exhibit was handled in a new manner this year The Medical Film Guild arranged the program under the supervision of Dr Theodore J Curphey The capacity audiences at all the showings of motion pictures spoke well for this arrangement

Banquet —The Banquet and Annual Meeting, held Wednesday evening on the Penn Top, were attended by nearly 300 people The highlights of the banquet were the interesting addresses by the retiring president, Dr Louis H Bauer, and the guest of honor, Dr Roger I Lee of Boston

Woman's Auxiliary —The Woman's Auxiliary expressed pleasure at the enlarged facilities made available to them Their membership and needs are growing greater every year, and the Medical Society is glad to be able to comply with them and help in every possible way

The spirit of cooperation among the members of the staff and committees was felt among the exhibitors and section and session chairmen, who expressed themselves in praise of the arrangements made to fill their requirements

Economics —Mr Farrell, director of the Bureau of Medical Care Insurance, made the following report

June 19, 1948 Mr Farrell, director, attended a meeting of the Council on Medical Service of the A M A , at which time the Council asked for an expression from all state society presidents or their representatives on the advisability of establishing a national service corporation between Associated Medical Care Plans and Blue Cross The following three recommendations were passed at the meeting

1 That this body representing the constituent state medical societies of the American Medical Association go on record as approving in principle the organization of a national service agency for the enrollment of national accounts for medical and hospital service and to act as the agent for existing nonprofit medical and hospital plans with full cognizance of the local autonomy of state medical societies

2 That the matter of the organization of such an agency be referred to the Council on Medical Service and that they gain data and advise the states what action they should take

3 That the Council on Medical Service should call a meeting of this type each year

A report of this meeting was submitted to Drs Simpson, Wertz, and Aaron by Mr Farrell

June 20, 1948 Mr Farrell attended the Conference of Presidents at the Sheraton Hotel, Chicago

June 22, 1948 Mr Farrell conferred with Dr Paul R Hawley, chief executive officer of Blue Cross Commission, at the offices of Associated Medical Care Plans, Chicago, and on *June 23* attended the Conference of Medical Society Executives

June 24, 1948 The director had a conference with Dr Wertz in Buffalo and on *July 22* attended a meeting called by Dr Wertz and held at the Society offices to discuss the four specialty services provided under Blue Cross contracts

August 5, 1948 Mr Farrell conferred with Dr Aaron in Buffalo to discuss plans for fall meetings of Dr Aaron's Subcommittee on Medical Care Insurance, and on *August 7* called on Dr Ellis B Soble, president of the Medical Society of the County of Monroe, regarding the inclusion of anesthesia in Blue Cross contracts

At the request of Dr Elton R Dickson, Mr Farrell has arranged a round-table conference on Medical Care Insurance as part of the program of the Sixth District Branch meeting at Binghamton on October 6

A communication from Mr John F McCormack, executive vice-president of United Medical Service, addressed to Dr Anderton, regarding the use of the words "approved by the Medical Society of the State of New York" on United Medical Service letterheads was referred to Mr Farrell for discussion with Dr Aaron Dr Aaron is in favor of this—in fact, feels it would be good policy for all plans approved by the Medical Society of the State of New York to do likewise This phraseology is now being used by many approved plans in their descriptive literature

It was voted that the Council has no objection to the use of the phrase "approved by the Medical Society of the State of New York" on the United Medical Service letterhead

The regular quarterly progress report as of June 30, 1948, on the six voluntary nonprofit medical care insurance plans in the State approved by the Medical Society of the State of New York and prepared by Mr Farrell, follows

* See NEW YORK STATE J MED Part II September 1 1948 p 117

Membership on June 30, 1948, was 1,303,178 representing an increase of 279,563 members during the first six months This increase exceeds the same period of 1947 by 19 493 members.

Incurred benefits to participants for the first six months of 1018 were $2,858,405 as compared to $1,460,770 for the same period in 1947 The increase in benefits of $1,397 635 during this period was 95 68 per cent more than for the comparable period in 1947 Statements in detail are shown in the following tables

Albany plan are $3,500 for a family $2,000 for an individual, and under United Medical Service $1,800 for an individual and $2 500 for a family

'Due to increases in wages and labor demands the tendency is growing for plans writing service contracts to increase income levels which, if satisfactory to labor groups will perhaps decrease agitation for some form of compulsory socialized medicine, but an increase in income levels will necessitate increases in indemnity schedules and premium rates to permit higher fees by the plans to physicians

which would be consistent with normal charges for nonsubscribers with comparable incomes

"I am aware of abuses experienced in offering service contracts, but believe that with control in the hands of the medical profession a fee schedule could be worked out which would have sales appeal and furnish fair compensation to the doctors for services rendered

"A check of the county or state society-approved plans in the United States disclosed that approximately 26 are on an indemnity basis and 32 on service, that income levels vary from $2 500 to

$5,000 for a family Medical-Surgical Plan of New Jersey is going to offer a new contract on a service basis up to incomes of $5,000 regardless of marital status and is increasing indemnity schedule and premium rates by approximately 50 per cent."

The supplementary report was presented at the request of Dr Aaron who stated that after further study by his Subcommittee, a report would be presented at a later Council meeting

Malpractice Insurance and Defense Board.—Dr Leo F Schiff chairman, sent the following report under date of August 31 1948

Reference is made to the directive of the House of Delegates that a study be made of the Alameda County (California) Medical Association s malpractice claim prevention program which was referred to this Board by the Council on June 30, 1948

A preliminary study of that program indicates that it is primarily an ambitious and far reaching venture into the fields of public relations and medical economics and whatever success has been achieved in reducing malpractice costs has been a corollary of the improvement in public relations Nevertheless the reduction in the number and cost of malpractice actions has been tremendous, as reported by the A C M.A. *Bulletin* and for that reason alone, the plan ' should have careful study

Because of the scope of the program and the many activities it involves, the Malpractice Insurance and Defense Board has concluded that before definite and comprehensive recommendations can be made to fulfill the directive of the House of Delegates, a detailed study of the entire program should be made in Alameda County by a special committee Such a committee might well be composed of one member of this board, and its secretary together with a member of the public relations committee of the State society and the legal counsel or his representative since the laws of California, and their application to malpractice may have some important bearing on the situation in that state

This Board has received information showing that during the first six months of 1948, 33 more suits were begun than during the corresponding period of 1947, necessitating an increase of reserves for outstanding suits and claims by approximately $100 000 This is a dangerous situation, and the Board believes that prompt action to halt this spiral of increasing costs is urgent.

This Board therefore, recommends that such a committee be authorized to carry out the study as soon as possible and that an appropriation be obtained of the funds necessary to cover the expenses of the committee

A copy of the preliminary study referred to in the second paragraph is enclosed for the information of the Council

To Members of the Malpractice Insurance and Defense Board

SUBJECT: Alameda County Medical Association Program

"By direction of the House of Delegates, the Malpractice Insurance and Defense Board is required to investigate the malpractice prevention programs adopted by the Alameda County (California) Medical Association and other medical organizations to determine whether any of the measures being tried elsewhere can be adapted to good advantage to our situation in New York State

"This directive was inspired by a resolution offered by Dr Frederick Wetherell of Syracuse, who is the editor of the *Onondaga County Bulletin* He has been in correspondence with the authorities of Alameda County Medical Association and is impressed with the efficacy of their program as described in their county bulletin I have subscribed to the A C M.A *Bulletin* and secured copies of the recent issues which referred to their malpractice prevention plan. Their plan apparently has been adopted by four of the other "bay' counties around San Francisco and Oakland.

"Alameda County includes both Oakland and Berkeley The population of the county is not known but the membership of the A.C M A. is between 900 and 1,000 only 483 of whom are insured in the A.C M.A. plan Before the plan was inaugurated the cost of $25,000/$75 000 limits was $126 plus $31.50 ' for the first nurse" or a total of $157.50 During the two years the plan has been in operation there has been no 'untoward experience,' and, as a result, premiums for those limits have twice been reduced 10 per cent making the present rates $55.80 including the first nurse which would indicate that the initial rate under the plan was $69 75

Malpractice claim prevention is only a corollary part of the A C M.A. program which is an ambitious venture into wide fields of public relations and medical economics providing many services to the public and members of the Association part of which is advertised in the public press Among these services are the following

'1 Guaranteeing to every person in the county competent medical care regardless of ability to pay

"2 Twenty four hour services by telephone for persons requiring immediate medical care

' 3 Operation of a blood bank with all types immediately available to everyone regardless of ability to pay

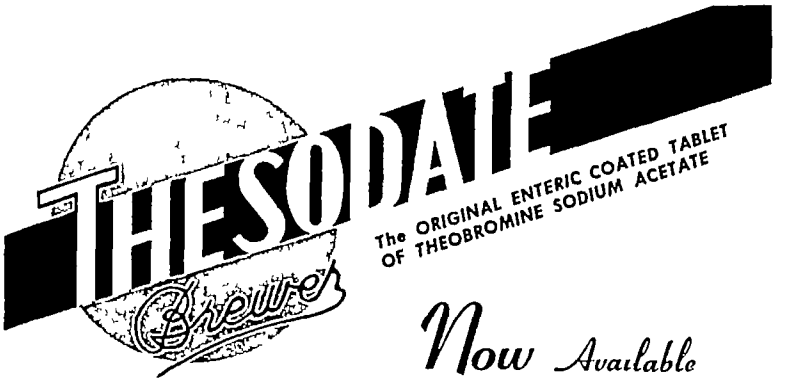
4 Adjustment of all differences between patients and their doctors, including fees and claims for malpractice This includes answering all questions about the rights of the patients and directions where to go for the type of medical service required.

5 Collection service for members which undertakes to study the economic situation of the patients involved and to maintain a credit rating service. This includes a patient s account financing service and a postpayment plan

"6 Advice on practically everything involving the economic side of a member s practice, including accounting and office methods, auditing, forms, monthly billing service, tax advice, and assistance.

'7 Distribution of medical care office space equipment, nurses, secretaries and assistants.

'8 Reservations for hotels and transportation.



'9 Malpractice insurance, defense and advice

'10 Health and accident insurance

'These are only part of the direct individual services which are in addition to the general public health and community activities

"To establish these services, apparently, it was necessary to revamp the whole Association including the method of electing officers. Many of these services are furnished by committees of members. In the case of the adjustment of various claims against members there are four committees scattered about the county In addition there are more than 30 full-time, lay employes.

'It is stated that, in dollar value the various activities of the Association are close to half a

[Continued from page 2514]

Another most interesting paper was read by a dentist, Dr A Lexington Jones, from Christchurch, New Zealand, who gave a nine-year summary of government medicine in New Zealand and its social, economic, and political implications—a most informative paper from a man who has lived there for ten years

Mr Stewart Hayden, former foreign editor of the Scripps-Howard newspapers, and who is currently of the National Press Club in Washington, also delivered a very interesting paper

Dr Irons addressed the conference and alluded briefly to experiences in Tokyo He is not permitted to make any statements until General MacArthur releases the report, but he said the implications to him were quite encouraging

The chairman of the Public Opinion Poll from Princeton, Dr Claude Robinson, gave an excellent talk on what we should do to push our program and how we should do it

Representative Busbee, of Illinois, long a member of the Un-American Affairs Committee of the House of Representatives, way back from the days of its inception, gave an interesting discussion of the activities of the communists of the United States

All of these papers are going to be printed I think the organization is doing an excellent job, and I am sure something will come out of it that will be of interest

Publication—Dr Anderton reported for Dr Kosmak, who had to be out of town

The Publication Committee met Tuesday, September 7 A number of routine matters were taken up Among others that the Council would like to know about I believe was that approval was voted for the omission of advertisers' names from the published minutes of the 1948 House of Delegates, including those mentioned in Dr Bauer's speech It was felt that to broadcast the names of advertisers who were being criticized by the profession would be a mistake Mr Anderson announced that the 1949 Directory would be delivered to members by approximately February 15, 1949

Dr Redway stated that it may be of interest to the Council members to know that the October 1 issue will start a new page service to appear in every issue of the JOURNAL on facts about nutrition, prepared by the School of Nutrition, Cornell University, of which Dr Norman S Moore is director It will run for 24 issues of the JOURNAL and will condense into a handy form for practitioners and anybody who wishes all of the present knowledge concerning the mechanism of the utilization of food which it is possible to get into a single page in each issue

It was voted to accept the report

Public Health and Education.—The report as distributed with the agenda is as follows

Activities of the Chairman—June 21, 22, 23, and 24 Attended meeting of the House of Delegates of the American Medical Association in Chicago

June 23 In Chicago, addressed a meeting of the Associated State Postgraduate Committees on the subject "The Postgraduate Medical Education Program of the Medical Society of the State of New York"

July 9 In New York City a meeting was held to discuss several phases of the problems of civilian defense, blood banks, atomic energy, and related subjects In attendance were some of the members of the newly appointed Emergency Preparedness Committee, some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health and the City of New York Department of Health

Following this meeting, the president of the Medical Society of the State of New York appointed the following physicians as members of a Subcommittee on Blood Banks, Lester J Unger, chairman, New York City, Eugene L Lozner, Syracuse, and Morris Maslon, Glens Falls

This Subcommittee, if approved at the meeting of the Council on September 9, 1948, will consider the plan of the American National Red Cross to establish a nation-wide blood donor service program to provide free blood

July 16 In Syracuse conferred with Mr C A Millspaugh, executive assistant to the New York State Commissioner of Health, concerning the material for the page devoted to the activities of the Medical Society of the State of New York which appears in the *Health News*

July 21 In Saratoga to attend the annual meeting of New York State Health Officers

July 28 A meeting of the Subcommittee on Blood Banks was held in Albany Present at this conference, in addition to the members of the Council Committee on Public Health and Education and the Subcommittee on Blood Banks, were some of the officers of the Medical Society of the State of New York, some of the members of the Emergency Preparedness Committee, and representatives of the New York State Department of Health and the City of New York Department of Health

August 27 In New York City a meeting of the Subcommittee on Blood Banks was held with representatives of the American National Red Cross Also present at this meeting were members of the Council Committee on Public Health and Education, the Emergency Preparedness Committee, and representatives of the New York State Department of Health and the City of New York Department of Health

Postgraduate Instruction—Arrangements have been completed for postgraduate instruction to be presented in the following counties Allegany, Cayuga, Onondaga, Orange, Otsego, Richmond, Schoharie Steuben, Sullivan, and Tompkins

The Monroe County Medical Society will have a meeting on November 11, 1948, in Rochester and has requested us to arrange for five speakers

Arrangements have been made for a speaker for a joint meeting of the Syracuse and Rome Academies of Medicine to be held in Rome in the near future

The *1948–1949 Course Outline Book* will include a special announcement on the subject of medical aspects of radioactive materials Letters were sent to the deans of the medical schools in New York State requesting them to submit the names of one or two members of their faculties who would be available for lectures at meetings of county medical societies and other medical groups

Blood Banks—In the absence of Dr Mitchell, Dr Simpson spoke on the subject of Blood Banks

After discussion, *it was voted* that Dr Simpson be empowered to send a letter to the presidents of the county medical societies stating that since the meeting of the House of Delegates, further studies have been made with the result that at present it seems that the Red Cross is going to function in New York State, that it is for the county societies

[Continued on page 2518]

"....a distinct advance in the treatment of scabies" *

THE unusual therapeutic efficacy of Kwell Ointment in the control of scabies was again demonstrated in a recently reported study * By means of Kwell Ointment it was possible to produce complete eradication of scabies in over 95 per cent of the patients treated Not a single instance of dermatitis due to the active ingredient was encountered These results led the author to term Kwell Ointment " a distinct advance in the treatment of scabies "

Kwell Ointment owes its unique scabicidal properties to the gamma isomer of 1, 2, 3 4, 5 6-hexachlorocyclohexane which is incorporated in a vanishing cream base This substance is rapidly lethal for the sarcoptes of scabies but, in the concentration employed, is nonirritant for the human integument. Kwell Ointment is equally efficacious in the control and eradication of pediculosis capitis, corporis, pubis.

Kwell Ointment is available on prescription at all pharmacies in 2 ounce and 1 pound jars Descriptive literature available to physicians on request

to cooperate and assume their responsibility in the medical aspects (which apparently the Red Cross wants), and that there is no objection to the formation of other blood banks in New York State under private or hospital auspices, free or paid

The appointments by the president of Dr Lester J Unger, Dr Eugene L Lozner, and Dr Morris Maslon were approved as the Subcommittee on Blood Banks

Public Relations.—Dr Winslow, chairman, presented the following report

On June 4, Mr Anderson visited the Kingston-Newburgh area to study the public relations setup there

Mr Miebach and Mr Walsh attended the Public Relations Conference of the Medical Society of New Jersey at Trenton on June 13 Both spoke in connection with the coordination of the public relations of county societies with the state society program

Dr Floyd S Winslow, chairman of the Committee on Public Relations, Mr Anderson, Mr Walsh, and Mr Miebach represented the Public Relations Bureau at the annual A M A meeting in Chicago, June 19 to 25 During the course of the meeting the personnel of the Public Relations Bureau assisted in maintaining a headquarters for the New York State delegation at which delegates from various sections of the country were entertained Mr Anderson, Mr Walsh, and Mr Miebach also attended the Medical Executive Secretaries Conference on June 23 in Chicago, and Mr Anderson was one of the speakers in a round-table discussion regarding administrative problems of medical societies

Mr Anderson prepared an article for the summer issue of *The Distaff* The issue was mailed by the Public Relations Bureau

Concurrently with an address made by Dr Leo F Simpson, president, before the Oneida County Medical Society in Utica, New York, on June 13, the Public Relations Bureau issued a news release based upon the text of Dr Simpson's talk On July 27 another news release was issued, this time on the appointment of a Blood Bank Committee by Dr Simpson

Dr Winslow, Mr Walsh, and Mr Miebach represented the Public Relations Bureau at the Annual Conference of Health Officers and Nurses at Saratoga Springs on July 21 to 23 At this conference Dr Simpson delivered an address, "The Doctor and Public Health" News coverage for this speech was arranged in cooperation with the press bureau of the State Health Department, and subsequently the talk was published in the August 15 issue of "*Vital Speeches of the Day*" Copies of this publication were sent to officers, members of the Council, and trustees, and 25,000 reprints were secured for mailing to a selected list of important individuals and organizations throughout the State

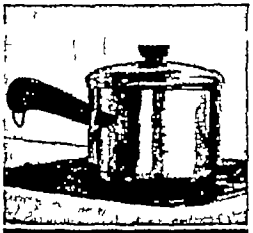
The Public Relations Bureau received prior notice of publication in the July 24 issue of the *Saturday Evening Post* of an article entitled, "They're Trifling with Your Life," dealing with the activities of antivivisection promoters Arrangements were made with the circulation department of the *Saturday Evening Post* to obtain a summary of the article, which was sent out on July 20 with a News Letter calling it to the attention of the membership of the Society

Following receipt of a request from Lois Mattox Miller, medical writer for the *Reader's Digest*, for material for a proposed article on blood banks, the Public Relations Bureau arranged a conference in the Society's offices on July 9 At this conference, attended by those most vitally interested in the blood bank situation, the blood bank question was discussed in detail Subsequently, a statement on the Society's blood bank policy was prepared in draft form and mailed to a selected list for comment Replies received by the Bureau indicated a mixed reaction Consequently, it was decided to hold the statement in abeyance

The following postgraduate sessions, held under the auspices of the Committee on Public Health and Education, were covered by releases to the press Allegany, Cayuga, Chenango, Jefferson, Oneida, Ontario, Otsego, Rockland, St Lawrence, and Suffolk

In addition, two special releases were mailed One concerned the rise in membership in voluntary medical care plans in New York State The other was a statement made by Dr J Stanley Kenney with relation to action of the State hospital planning commission

A communication has been received from Dr Morris Weintrob enclosing a copy of a publication known as *Health Forum*, published by the Flatbush Medical Group, affiliated with the Health Insurance Plan of Greater New York Dr Weintrob asked to be advised regarding the ethics involved, inasmuch as the publication is in the nature of advertising It is the recommendation of this Committee that the matter be referred to the Council for appropriate action condemning this type of publicity as unethical and that the Secretary be directed to write a letter of protest



It was voted that the Council send a letter of protest to this group against *Health Forum*, volume 1, issue 1, July, 1948, that has been presented to the Council, that in it we state why we feel the publication is unethical, and that a copy of the letter be sent to the Kings County Society and to Dr Weintrob

Mr Walsh attended the convention of the New York State Department of the American Legion at Saratoga in an effort to determine what position the Legion is taking on the continuation of the Veterans Medical Service Plan of New York The general sentiment is definitely in favor of continuing the plan, but few if any Legionnaires, with the exception of those who have had dealings with the Veterans Administration, are aware that the plan has not been renewed for 1948 and 1949 Some of the members of the executive board discussed the possibility of having a resolution drawn up and presented to the convention which would put the Legion on record as favoring the continuation of the plan, but unfortunately the rules of the convention did not permit such action at so late a date It was decided that the matter would be submitted to the executive committee at its midwinter meeting in January and that the body would be requested to go on record urging the Veterans Administration to continue the services that are now available to all the veterans of New York State under the Veterans Medical Service Plan of New York

Woman's Auxiliary—Dr Beekman, chairman, reported as follows

I attended the meeting of the Executive Committee of the Woman's Auxiliary yesterday in which the ladies discussed their activities for the coming year There was one question that they wished me to present to the Council, and that was the relationship of the chairmen of the advisory committees of the county medical societies to the comitiae minora of the counties It seems that in many of the counties,

[Continued on page 2520]

1. Boil the water and cool to luke-warm

2. Float measured powder on top of the water

3. Mix with a large spoon or fork

SIMILAC FEEDINGS ARE

Easy TO PREPARE

It takes only 30 seconds to induce solution *if the powder is floated on top of the water* Lukewarm, boiled water is desirable.

No need to mix several ingredients—hence the possibility of errors in measurement is greatly reduced

The ratios of fat, sugar, and protein, *and the zero curd tension*, remain constant regardless of concentration Therefore, no gastrointestinal disturbance will normally occur, should the mother err occasionally in counting the number of measures of Similac powder

The level tablespoon measure in each can eliminates the possibility of underfeeding or overfeeding due to varying sizes of "tablespoons"

Result Similac reduces dietary disturbances traceable to mothers errors in preparation of the formula

SIMILAC a dependable food during the all-important first year

M & R DIETETIC LABORATORIES, INC • COLUMBUS 16, OHIO

[Continued from page 2518]

or most of the counties, the chairman of the advisory committee is not a member of the comitia, therefore, in many ways there is not the close touch between the woman's auxiliary of the county and the comitia minora that there should be They asked me to bring to your attention this matter and to suggest that the Council go on record as recommending that the chairman of the advisory committee of the woman's auxiliary of the county medical society be selected from among the members of the comitia minora of the local societies so as to have that desired tie It is just a recommendation so as to make a real contact between the auxiliary and the county society

It was voted that the Council transmit to the president of each county medical society the recommendation that the chairman of the advisory committee on woman's auxiliary be a member of the comitia or invited to attend comitia meetings

Workmen's Compensation.—Dr Kenney, chairman, reported as follows

I attended a meeting on June 30 of the Advisory Council to Miss Donlon and her Workmen's Compensation Board There was no matter brought up in that particular meeting that required attention or any action of the Medical Society

The report for the Committee consists chiefly in the activities of the Bureau during the summer, and I am not going to read it, but I will give it to the recorder for inclusion in the minutes There are a few titles in it though that I think warrant a brief discussion, and I am going to ask Dr Kalski to do that as briefly as possible

REPORT

Case of Wrong Diagnosis.—An interesting case involving a question of incorrect diagnosis, based upon symptoms and signs sufficient to warrant the diagnosis made, in which an insurance carrier authorized an operation for epigastric hernia but which at operation subsequently turned out to be a small lipoma in a traumatized area, has recently come to our attention

The diagnosis had been concurred in by three physicians When the physician reported the operative findings, the carrier refused to pay for the operation which had been authorized It was the doctor's contention, and in this we concur, that the patient suffered an accident under the Workmen's Compensation Law, that he presented symptoms and signs which could be related to an epigastric hernia, and the diagnosis was concurred in by a number of physicians All this was done in good faith, and we are supporting the physician's claim for the payment of his bill of $100 allowed for epigastric hernia

In another instance a physician made a diagnosis of inguinal hernia The insurance carrier authorized operation Here too, the signs and symptoms were sufficient to warrant a strong probability of inguinal hernia Patient had suffered a compensation injury At operation the physician found a cystic growth in an inflamed area This was removed. Carrier refused to pay for the operation claiming that the patient had not sustained an inguinal hernia and this despite the fact that they had authorized operation They cited the case of Van Wess *vs* Nurnberg Thermometer Company, 266 App Div 1050

After consultation with attorneys we contended that this decision was not binding or pertinent, as in this particular case the claimant was denied compensation for a hernia which was not present Granting in this case that no hernia was present, the symptoms were such as to lead a competent physician to make such diagnosis, and the operation was performed in good faith after authorization had been given The doctor is not a guarantor of his diagnosis or of the success of his operative work The diagnosis was made in good faith and concurred in by other physicians before operation Patient's symptoms justified the diagnostic conclusions

It is our contention that unless the bona fides of the doctor can be successfully attacked, the carrier is liable for payment of an authorized operation The law imposes certain requirements on the doctor He must obtain authorization before operation The carrier is entitled to examination before operation if circumstances permit It is not known in this case whether the carrier availed himself of the examination, but it did give authorization, and this implies a contractual relationship between the doctor and the authorizer The operation indeed served the purpose of enabling the carrier to ascertain whether or not the patient actually suffered a hernia or an aggravation to a pre-existing condition This evidence is available for the protection of the carrier's interest at the time of the hearing on liability for a hernia This bill was submitted for arbitration, but since arbitration decides the value of the physician's services and not questions of liability or compensability, it was decided that arbitration could not take place under the circumstances

Authorization for Qualification in Metropolitan Area.—There has been considerable dissatisfaction in the counties of New York, Kings, Queens, and the Bronx with the way in which the Medical Practice Committee has acted upon the recommendations of the county medical society workmen's compensation committees regarding physicians who have applied for compensation ratings or changes in ratings and who subsequently receive final authorization through the Medical Practice Committee as required by law In many instances the final judgment of the Medical Practice Committee was not in accordance with the recommendations made by the county societies, and the committees were not notified of the difference of opinion before the Medical Practice Committee took final action This was discussed at a meeting of the Coordinating Council early this year when it was decided to send a committee to meet Miss Donlon and discuss the matter with her Such a meeting was held on May 27, 1948 Your chairman appeared with the Committee.

Medical Bureaus— Voluntary Hospitals.—On June 9, Communication 79 was sent to the chairmen of the workmen's compensation committees of each county society asking for information on the voluntary hospitals which had applied for licenses to conduct x-ray laboratories in accordance with the provisions of the 1947 amendment of Section 13-c 2 of the Workmen's Compensation Law We asked for information as to the number of hospitals which had applied and what action had been taken by the county societies Thirty-nine counties have replied We have not heard from the counties of Bronx, Chenango, Columbia, Essex, Franklin, Genesee, Jefferson, Kings, Lewis, Montgomery, New York, Oneida,

Orleans, Putnam, Saratoga, Schenectady, Schoharie, Tioga, Tompkins, Warren, and Yates Of these 39, 15 have replied that no applications have been received from voluntary hospitals In the other 24 applications have been received from 44 hospitals

General Practitioners Performing Major Operations (*X*) —An insurance carrier objected to a bill of a physician with a rating of X, general practice, who performed a major surgical operation Investigation showed that the physician in question called in a qualified surgeon to perform the operation and submitted a bill to the insurance carrier for the operation in his own name Presumably, there was an arrangement whereby the operating surgeon was compensated by the attending physician This, however, is unknown to us This matter was referred to the chairman of the Workmen's Compensation Committee of the county medical society who stated that the doctor was not qualified as a surgeon and also stated that he believed the complaint of the insurance carrier was justified The matter was taken up with the physician who, in his reply, stated that he thought it was common practice for general practitioners in like circumstances to call in a surgeon to operate and for the general practitioner to assist the surgeon, and then to continue in the aftercare of the patient, rendering the bill for the services

This matter was referred back to the county society for a hearing The Workmen's Compensation Law definitely states that the physician must confine his practice to what he is qualified to do and what the county society compensation committee recommends that he be authorized to do

In obtaining authorization to treat compensation claimants, the physician agrees to limit his practice to such medical care as his experience and training qualify him to render Section 13-d of the Workmen's Compensation Law permits the medical society to recommend the removal of a physician from the authorized list if he exceeds the limits of his qualifications or is guilty of professional or other misconduct which may be indicated by the practice of calling in a surgeon and rendering a bill for services performed by another person We have recommended that the entire matter be reviewed by the full compensation committee of the Medical Society which should also enquire into the legal and ethical questions involved This undoubtedly will be done and reported on later

New Fee Schedule —On May 8, 1948, we were informed by the chairman of the Workmen's Compensation Board that the Advisory Committee on Revision of the Workmen's Compensation Fee Schedule had concluded its studies, and as a result of their recommendations based upon suggestions made at open hearings and thereafter, the chairman, on their unanimous recommendations, had adopted a new fee schedule

The fee schedule is labeled Medical Fee Schedule and becomes effective September 1, 1948 There is an addendum on the cover which states that it is a schedule of minimum charges for medical treatment and care established for the entire State

This, in effect, establishes the principle approved by the Council that the fee schedule is a minimum fee schedule under the provisions of the Workmen's Compensation Law

The schedule is printed in attractive format It consists of 995 items Items 1 to 8 were made effective for all cases injured on or after June 1, 1947 The remaining items become effective in all new cases arising on and after September 1, 1948, and in old cases reopened on and after September 1, 1948

Full credit is given to the prodigious work of the Advisory Committee of which Dr Nathan B van Etten was chairman and Dr W P Anderton one of the members The booklet also contains extracts from the Workmen's Compensation Law, explanatory notes emphasizing the principle of free choice, and states unequivocably that, where authorization for medical services costing more than $25 has been unreasonably withheld, the Workmen's Compensation Board is required to determine whether the requested services were necessary

There are a number of items in the Fee Schedule which require clarification by the chairman of the Workmen's Compensation Board We are endeavoring to arrange a meeting with the chairman and other interested parties to discuss these at an early date

Fee for Nonspecialistic Treatment —A situation that frequently arises is where a specialist treats a patient not necessarily requiring the attention of a specialist and charges a specialist's fee Many insurance carriers object to paying specialist fees in minor injuries Under the Workmen's Compensation Law a patient is entitled to treatment by a specialist, and a specialist may charge the scheduled specialist fees for such treatment. There is no prohibition against a patient directly visiting a specialist in surgery or orthopedic surgery, for example, rather than going to a less qualified physician for treatment Under the old fee schedule the situation did not often arise in regard to the (SA) surgeon because there was no differential between the surgeon's fee and the general practitioner's fee for aftercare The situation did arise frequently where patients with minor injuries went to orthopedic surgeons (SB) whose fees were higher than those of the surgeon or general practitioner

The question is—if a specialist directly accepts and treats a patient with a minor injury, is he entitled to a specialist fee or a regular general practitioner's fee? The situation will arise more frequently in the future because the surgeons' fees have been increased in the new schedule and are greater than those of the general practitioner The dispute does not arise when a patient is referred by a general practitioner to a specialist for treatment It will arise more frequently under the new fee schedule and will have to be resolved in a reasonable and equitable way Many specialists in the past whose bills have been objected to have accepted the general practitioner's fee where the injury was of a minor nature and particularly when the injury did not follow directly within the specialist's field It is our opinion that where a surgeon treats a compensation claimant under the new fee schedule, he should be paid a specialist's fee regardless of the nature of the surgical injury because the patient is assured of the services of a specially qualified physician and certainly the expert is entitled to the regular specialist's fee provided the patient falls within the specialty Should a condition not fall within the specialty and the specialist elects to treat the patient, then we believe the general practitioner's fee should be

paid Some thought should also be given to the practice of some specialists in treating patients not within their specialties and how far a specialist may go in this respect and retain his specialty rating

Medical Questions by Lay Representatives of Insurance Carriers —After the receipt of a number of complaints from physicians against a large insurance carrier because of the way in which their lay claim representatives were contacting the physicians and discussing indications for treatment, number of treatments, type of treatment, and other matters relating to medical practice and medical bills, we conferred with the manager of the insurance carrier and succeeded, we believe, in correcting the unethical and improper practices This was a recrudescence of a situation which was very bad a number of years ago and was corrected at that time as a result of our intervention

It is the practice of certain insurance carriers to permit lay individuals to argue medical questions with physicians rather than turn these matters over to their medical personnel This causes bad relationships between the profession and the carriers who indulge in these practices We are of the opinion, however, that there are now better relationships with the majority of insurance carriers, many of whom consult our bureau on most questions of medical practice and billing

The setting up of joint councils in the various districts of the State and the State Joint Council have had and will continue to have an important effect in doing away with these practices and improving relationships Only recently the Erie County Medical Society Compensation Committee refused to recommend a medical bureau license for a large industrial plant in Erie County The decision of the county society was based on a very careful investigation which disclosed certain practices in the plant which needed correction When the matter was brought to our attention, we were in touch with the industrial concern whose offices are in New York City and succeeded in bringing together the parties The employer conceded the practices were not to the advantage of the injured workers and is in process of correcting same

This points out the importance of careful investigation by county medical societies on all applications for medical bureau licenses The highly efficient and courteous way in which this matter was handled by the chairman of the Workmen's Compensation Committee of the Erie County Medical Society deserves commendation

Authorization in Metropolitan Area —There has been a tendency of late for certain county medical societies in the metropolitan area aiding the Medical Practice Committee in the qualifying of specialists to insist upon such practitioners obtaining a diploma of a specialty board before recommending the physician for specialist rating We believe this is not a good practice

The county societies outside the metropolitan area are boards of original jurisdiction and have their own standards with which to gauge the qualifications of physicians These should be strictly adhered to The diploma of the Medical Board may be accepted as one evidence of qualification, but to refuse qualification to a physician who has all the qualifications specified in the standards which are the equivalent of the National Board requirements would be improper and would surrender to the National Board the functions of the county qualifying committees in workmen's compensation Indeed, it may be the basis for the State requiring such National Board diplomas and limiting specialists ratings to possessors thereof, making the functions of the county medical society superfluous

Rule 19 —We wish to draw attention to the fact that in the addendum to the Workmen's Compensation Law issued in July, 1947, by the New York State Workmen's Compensation Board on page 213, Rule 19 on Rules and Procedure Relative to Medical Surgical Care for Treatment under the Workmen's Compensation Law, there is a statement to the effect that

> "Hospitals may render bills for board and room accommodations, medical and surgical supplies, and nursing facilities Voluntary hospitals may bill for x-ray services when rendered by an x-ray laboratory or bureau of such hospital duly licensed by the chairman Hospitals may bill for physiotherapeutic, anesthesia, and pathologic services when rendered by or under the supervision of salaried physicians on the staff The names and qualifications of all physicians and persons rendering services for which charges are made by hospitals must be included in all bills, and all medical and x-ray reports shall be promptly filed with the Workmen's Compensation Board and with the employer or its insurance carrier (as amended May 29, 1947)"

A similar rule is printed in the new medical fee scheduled On page 48, Rule 19, it is stated that the Workmen's Compensation Law was amended in May, 1947, to this effect The rule as published *is correct only in so far as it pertains to* voluntary hospitals and salaried roentgenologists employed by them where the hospital has obtained a license to conduct an x-ray laboratory We find no provision in Chapter 766 of the Laws of 1947 affecting pathology, anesthesiology, or physical therapy treatment in hospitals by salaried employes We have enquired of Mr Henry J Clay, general counsel to the Workmen's Compensation Board, for the authority for the inclusion of these specialties in the rules and regulations as published by the Workmen's Compensation Board Chapter 766 of the Laws of 1947 resulted from the passage of Assembly Int 2712 (Committee on Rules) and became effective immediately on passage in 1947 This was an amendment to Section 13-c 2 of the Workmen's Compensation Law and authorized voluntary hospitals to obtain an x-ray bureau license and to render bills for salaried employes for x-ray examination and treatment

Bureau Correspondence —The correspondence of this Bureau has been especially heavy during the summer months contrary to our usual experience, 276 communications were sent out

The Bureau of Bill Collections is growing, and physicians and county medical societies from all parts of the State are availing themselves of our facilities in ever increasing numbers

Report of Delegates to the American Medical Association House of Delegates —Dr Winslow presented the following report

The following gentlemen were in attendance at the 1948 Annual Meeting of the House of Delegates of the American Medical Association, representing the

Medical Society of the State of New York John J Masterson, J Stanley Kenney, Thomas A McGoldrick, Andrew A Eggston, Harry Aranow, Peter J Di Natale, George W Kosmak, Stephen R Monteith, Joseph P Henry, Scott Lord Smith, W P Anderton, Herbert H Bauckus, Albert F R Andresen, Thomas M Brennan, James R Reuling, Floyd S Winslow, Ralph T B Todd, O W H Mitchell, Edward P Flood, and Albert A Gartner

Also members of the House were Arthur J Bedell (Section on Ophthalmology), Roy B Henline (Section on Neurology), Chas Gordon Heyd (Past-President of the A M A.), Louis H Bauer (Trustee of the A M A), Edward R Cunniffe (Chairman of the Judicial Council), Herman Weiskotten (Chairman of the Council on Medical Education and Hospitals)

Attended some meetings Robert R Hannon (Executive Officer), Mr Dwight Anderson (Executive Secretary), Miss Doris K Dougherty (Administrative Assistant), Mr Thomas E Walsh (Field Representative), Mr Frederick W Miebach (Director, Information Service)

Your Delegates met on Sunday evening, June 20, 1948, at 7 05 P M in Room 810 of the Palmer House, Chicago, Illinois This room was provided for our meetings in accordance with your recommendation which was acted upon by the Board of Trustees

The resolutions assigned by the House of Delegates of the Medical Society of the State of New York for introduction at the American Medical Association were discussed and assigned

Of the five resolutions your delegates were instructed to present, the one regarding the unfairness of drafting physicians for the Armed Services of the United States was not presented because the legislation to which it referred had already been passed by the United States Congress, omitting such draft

A resolution regarding the requirement by some hospitals that a physician have certification from a National Specialty Board before he can be eligible for a senior staff appointment was introduced by Dr Edward P Flood This was referred to the Reference Committee on Miscellaneous Business, which recommended its consideration by the Subcommittee of the Board of Trustees on the Practice of Medicine This committee reported favorably regarding our resolution The intent of the resolution was adopted by the House as part of the Subcommittee's Progress Report

Your resolution urging the American Medical Association to have its employes insured for hospitalization through a nonprofit plan was introduced by Dr Stephen R Monteith It was referred to the Reference Committee on Medical Service and Prepaid Insurance Similar resolutions, and one contrary resolution, were introduced As a result of the Reference Committee report, the House of Delegates went on record that the A M A. should contract both Blue Cross and Blue Shield organizations, if possible, when these organizations have available policies in Chicago

A change in the Constitution of the American Medical Association to the effect that no component society should exclude any qualified physician from membership by reason of race, creed, or color was introduced It was referred to the Reference Committee on Scientific Assembly This Committee reported that the American Medical Association is a federation and that the decision regarding its membership lies entirely within the rights of each county medical society

Dr Harry Aranow introduced your resolution regarding hospital and medical care for veterans This was passed by the House after favorable report by the Reference Committee on Legislation and Public Relations

Dr Thomas A McGoldrick was chairman of the Reference Committee on Legislation and Public Relations Dr George W Kosmak was a member of the Reference Committee on Reports of Officers Dr W P Anderton was chairman of the Reference Committee on Reports of Board of Trustees and Secretary Dr Edward P Flood was a member of the Credentials Committee Dr Thomas M Brennan was a member of the Reference Committee on Miscellaneous Business Dr Scott Lord Smith was a teller Dr J Stanley Kenney was sergeant-at-arms

It gives me pleasure to report that our Society was ably and conscientiously represented by this delegation and particularly to report to you that Dr James R Reuling was elected vice-speaker of the House of Delegates of the American Medical Association

Illness

It was voted that the secretary send letters to Dr Harry Aranow and Dr Thomas M Brennan expressing the regret of the Council at their illnesses and hopes for improvement

Deaths—Dr Simpson reported that Dr Albert A. Gartner died September 9 and that his funeral would be Saturday, September 11, at 3 o'clock in the afternoon at Forest Lawn Cemetery, Buffalo The secretary was instructed to write a letter of condolence to the family

Session Appointments—The following appointments were made by the President and approved by the Council

History of Medicine Richard A Leonardo, Rochester, chairman, and George Rosen, New York City, vice-chairman, with the Secretary to be appointed later by the president He has not yet been selected

Physical Medicine George F Bock, Watertown, chairman, and Hans J Behrend, New York City, secretary

Special Appointments.

It was voted that Dr Frey again be appointed observer from the Council to the meetings of the Coordinating Council of the Five Greater New York County Medical Societies

It was voted that Dr Harry S Mustard, commissioner of Health of New York City, be appointed an advisory member of the Public Health and Education Committee

---

A school teacher told her pupils to listen to their parents' conversation and if they heard any new words to look up the meaning in the dictionary and write a sentence using the word properly The next day she asked Johnny what word he had heard He replied that he had heard the word "pregnant" and the definition given in the dictionary was "To carry a child" The teacher asked, "Have you a sentence using it?"

"Yes, ma'am," he replied "The fireman climbed a ladder into the burning building and came down pregnant"—*Medical Briefs, September, 1948*

Orapen-250

It is now possible to give 250,000 units of crystalline penicillin G (potassium salt) in one coated, pleasant tasting, buffered tablet, if you specify the Schenley product. Ample evidence supports the value of the oral administration of penicillin when given in sufficiently high dosage. Clinical reports show that even serious infections due to penicillin sensitive organisms—such as acute respiratory illness [1,2,3,4] impetigo,[4] gonorrhea,[5] and rheumatic fever (prophylaxis)[6]—can be treated effectively by this convenient, painless method of administration.

ORAPEN IS UNIQUE
A special coating completely masks the taste of penicillin. Orapen is stable at ordinary room temperatures eliminating necessity for refrigeration.

NECROLOGY

Charles E Baker, M.D, ninety, died on September 23 Dr Baker was graduated from the Eclectic Medical College of the City of New York in 1882 He began his practice in Marietta in 1884 and continued until his retirement in 1936

Frederic Huntington Bartlett, M D, died at his New York City home on October 9 at the age of seventy-six Dr Bartlett, who was originally a teacher, was graduated from the College of Physicians and Surgeons, Columbia University, in 1905 He served as a major in the Army Medical Corps during World War I Dr Bartlett was an attending physician at Babies Hospital and was at one time chief of pediatrics at Fifth Avenue Hospital He was well-known as the author of the text, *Infants and Children Their Feeding and Care*, published in 1932

Dr Bartlett was a member of the American Medical Association, the American Pediatric Society, the New York Academy of Medicine, and the New York State and County Medical Societies

Joseph F Cusick, M D, of Binghamton, died on October 13 He was forty-two years old Dr Cusick, a member of the board of governors of Georgetown University, Washington, D C, was graduated from the Georgetown University School of Medicine in 1931 A major in the Army Medical Corps during World War II, Dr Cusick was an associate surgeon on the staffs of City and Lourdes Hospitals, Binghamton, and the Charles S Wilson Memorial Hospital, Johnson City Dr Cusick was a member of the American Medical Association and the New York State and Broome County Medical Societies

Julius Hammer, M D, seventy-four, of New York City, died on October 17 Dr Hammer, a general practitioner, was graduated from the College of Physicians and Surgeons, Columbia University, in 1902, and served his internship at Manhattan General and Sloane Maternity Hospitals Dr Hammer, who had retired before World War II, returned to active practice during the war and then retired again after the war He was a member of the American Medical Association and the New York State and County Medical Societies

Samuel H Korman, M D, of Brooklyn, died September 16 at the age of thirty-seven Dr Korman was graduated from the Eclectic Medical College, Cincinnati, in 1936 He was a psychiatrist who served as alienist at Kings County Hospital As supervising psychiatrist of Brooklyn State Hospital, Dr Korman developed special treatments in shock therapy for difficult mental cases and also assisted the Veterans Administration in this work He was a diplomate of the American Board of Psychiatry and Neurology and a member of the American Medical Association and the New York State and Kings County Medical Societies

George Lenz, M D, died on October 18 He was seventy-three years old Dr Lenz had practiced medicine in Gloversville ever since his graduation from Albany Medical College in 1900 Formerly chief of staff of the Nathan Littauer Hospital, Gloversville, he also served as consultant surgeon on the staff of this hospital Dr Lenz was a member of the American Medical Association and the New York State and Fulton County Medical Societies He was also a Fellow of the American College of Surgeons

Max Lehman, M D, of Queens, died on October 16 at the age of sixty-eight Dr Lehman was graduated from Cornell University Medical College in 1907 He was on the staff of Bushwick Hospital, Brooklyn, and was associated with the Prudential Insurance Company of America for more than forty years as examining physician A charter member of the Queens County Medical Society, Dr Lehman also belonged to the American Medical Association and the New York State Medical Society

William Little, M D, a general practitioner in Chenango County for fifty-four years, died at his home in Sherburne on October 19 at the age of eighty-two Dr Little, who had retired three years ago because of illness, was graduated from New York Homeopathic Medical College in 1891 He was village health officer for forty-three years in Sherburne Dr Little was honored for his fifty years of service in the medical profession by the Medical Society of the State of New York in 1944 He was also a member of the American Medical Association and the Chenango County Medical Society

Henry Brown Turner, M D, of New York, died on October 5 Dr Turner was forty-nine years old He was graduated from Johns Hopkins University School of Medicine in 1926 He was an assistant attending physician at New York Post-Graduate Hospital, an associate physician in the out-patient department of that hospital, and he also served as cardiologist for several insurance companies in New York City Dr Turner studied cardiology in London and Paris and had served on the staff of the American Hospital in Paris

---

MARRIAGE, DIVORCE DECREASED IN 1947

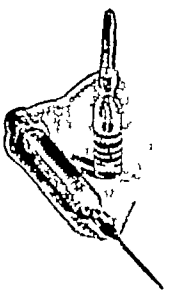
The divorce rate decreased sharply in 1947, the United States Public Health Service reported recently The marriage rate also was lower last year, it said The report was based on a preliminary census compiled by the service's vital statistics office

The divorce and marriage rates were lower only in comparison to the all-time highs set in 1946 Both remained well above prewar levels The number of divorces in 1947 was estimated at 471,000, compared to 610,000 in 1946

The divorce rate for 1,000 population was 3 3 last year, a decline of about 25 per cent from the 4 3 rate of 1946

The federal agency reported 1,992,354 marriages in 1947, compared to 2,291,045 in 1946 The marriage rate for 1,000 population was 13 9 in 1947, compared to 16 4 in 1946 The marriage rate was the second highest in history, being exceeded only by 1946 The divorce rate was the third highest, exceeded by both 1946 and 1945

RAY-FORMOSIL



for the treatment of

ARTHRITIS and RHEUMATISM

73% Benefited

In one series of clinic treated cases of atrophic, hypertrophic and mixed arthritis—with best results in hypertrophic and fibresitic types.

Ray-Formosil for intramuscular injection is a clinically proved effective treatment for Arthritis and Rheumatism. It is a non-toxic and sterile buffered solution containing in each cc. the equivalent of:

FORMIC ACID	**5 mg**
HYDRATED SILICIC ACID	**2.25 mg**

Descriptive clinical literature will be furnished upon request

Supplied in: 1 cc. and 2 cc. Ampuls
Boxes of 25 50 100
Price list of other Raymer Medicinals will be sent on request

MEDICAL NEWS

Seven Win Lasker Awards for Medical Work

THREE scientists and four public health administrators are recipients of the 1948 Lasker Awards for outstanding contributions to medicine, according to an announcement by Dr George Baehr, chairman of the committee of the American Public Health Association that selected the recipients Formal presentation of the awards was made at the dinner in Boston on November 11, with each individual award consisting of $1,000 and a gold statue

Scientific awards were given to Dr Selman A Waksman of Rutgers University, Dr Rene J Dubos of the Rockefeller Institute, and Dr Vincent du Vigneaud of Cornell University Medical College

Awards for administrative achievement went to Dr Martha M Eliot of the U S Children's Bureau, Washington, D C, and Dr Rolla E Dyer of the National Institute of Health, Bethesda, Maryland

The department of medicine and surgery of the Veterans Administration received the Lasker Group Award, with particular honor to Dr Paul R Hawley, former medical director, and Dr Paul B Magnuson, present medical director

Dr du Vigneaud was cited for his contribution to the chemistry of the vitamins and nutrition, and for leading a research team that first produced a synthetic penicillin

Annual Christmas Seal Sale Starts

THE annual sale of Christmas Seals, sole support of the National Tuberculosis Association and its 3,000 affiliates throughout the country, will begin on November 22 and end on Christmas Proceeds from this, the 42nd annual sale, will be used in the year-round fight against tuberculosis through education, case-finding, rehabilitation, and medical research Of the money raised each year through the sale of Christmas seals, 95 per cent is used within the state of origin, and five per cent is allocated to the National Association The specific program in each community depends on needs and resources

Set National Diabetes Week December 6 to 12

THE American Diabetes Association is launching a nation-wide drive of diabetes detection, with Dr Howard Root of Boston, Massachusetts, as chairman of the committee appointed to carry on this work The inauguration of a year-round Diabetes Detection Drive will be National Diabetes Week, to be held from December 6 to 12, 1948

As a first step in a full-scale attack on diabetes, eighth among the leading causes of death, the committee suggests that each county medical society appoint a committee on diabetes The National Committee on Diabetes Detection has programs available for medical meetings, radio broadcasts and spot radio announcements for use by both city and county medical societies, and suggestions for cooperation with local hospitals toward the control of diabetes, Dr Root announced

State Mental Hygiene Department Opens Food Service Training School

TWENTY-FOUR head cooks from the institutions of the New York State Department of Mental Hygiene enrolled October 11 for the opening session of the department's new Food Service Training School located at Hudson River State Hospital in Poughkeepsie, Commissioner Frederick MacCurdy announced The school, which includes a fully equipped food service laboratory, has been set up on a permanent basis for instruction of institution employes in food preparation and service

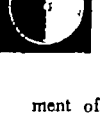
New England Journal Announces Prize Essay Contest

IN ACKNOWLEDGMENT of the support of more than 4,000 student subscribers, the *New England Journal of Medicine* has announced a prize essay contest open to all members of the class of 1949 registered in any medical school approved by the Council on Medical Education and Hospitals of the American Medical Association

The subject chosen for this year's competition is "Recent Advances in Preventive Medicine"

Manuscripts are to be between four and five thousand words in length, clearly typewritten in English, double or triple spaced with references listed at the end in numerical arrangement according to the form used by the *Quarterly Cumulative Index Medicus* They must be in the hands of the editor by March 15, 1949 All manuscripts will become the property of the *Journal*

A cash prize of $100 will be paid for the best essay of those found to be suitable for consideration, the paper will be published in the "Medical Progress" series that forms a regular part of the contents of the *Journal*, and the author will receive a hundred free reprints



A second prize will consist of a two-year subscription to the *Journal*

The editors wish to emphasize that in establishing this competition they are as much interested in encouraging good medical writing as they are in promoting the collection of scientific material In judging papers that may be submitted, particular attention will accordingly be paid to clarity, simplicity, and general literary excellence

[Continued on page 2532]

MODERN DIGITALIS THERAPY

reduces dosage  *to milligrams*

disability  *to hours!*

Simplicity of administration with dosage *by weight* and effect *in hours* —together with virtual freedom from locally induced nausea or vomiting —makes Digitaline Nativelle a preparation of choice wherever and when ever digitalis therapy is indicated

In developing the first clinically proven active principle of digitalis purpurea, Digitaline Nativelle has provided the medical profession with a major advance in the treatment of cardiac decompensation Utilizing the active principle, Digitaline Nativelle acts uniformly whether administered by mouth or by vein

Prescribed for these 5 advantages

1 Uniform potency by weight.

2 Identical dosage and effect when given intravenously or by mouth

3 Virtual freedom from gastric upsets and other untoward side effects.

4 Absorption and action is rapid uniform, determinable by the clock.

5 Active principle enthusiastically accepted by leading cardiologists.

SIMPLICITY OF ADMINISTRATION

RAPID DIGITALIZATION *1.2 mg in equally divided doses of 0.6 mg. at three-hour intervals.*

MAINTENANCE *0.1 or 0.2 mg daily depending upon patient's response.*

CHANGE-OVER *0.1 or 0.2 mg of Digitaline Nativelle may advantageously replace present maintenance dosage of 0.1 gm or 0.2 gm. of whole leaf*

Supplied through all pharmacies in 0.1 mg pink tablets and 0.2 mg white tablets—in bottles of 40 and 250. 1 ampules of 0.2 mg (1 cc.) and 0.4 mg (2 cc.)—in packages of 6 or 50. VARICK PHARMACAL CO., INC. (Division of E. Fougera & Co., Inc.) 75 Varick Street, New York, New York.

Digitaline Nativelle

active glycoside of digitalis purpurea (*digitoxin*)

Trudeau Memorial Held at Saranac

THE founder of the first tuberculosis sanatorium in the United States was eulogized by doctors who gathered at Saranac Lake on October 5 to celebrate the 100th anniversary of his birth

Memorial wreaths were placed at the statue of Dr Edward Livingston Trudeau on the grounds of the sanatorium that bears his name Dr David R Lyman, director of the Gaylord Farm Sanatorium at Wallingford, Connecticut, paid tribute to Dr Trudeau on behalf of the past and present Trudeau patients, who number 8,000 throughout the world

Among the speakers were Dr Miguel C Lascalea, of Buenos Aires, Dr M J Rojana, of India, and Dr Kung Chin Pao, of China Dr Ezra Bridge, director of Iola Monroe County Sanatorium, Rochester, said the cottage sanatorium Dr Trudeau founded in 1884 had grown to be the largest of its kind in the country

Women's Death Rate from Cancer Declines

THE death rate from cancer among women in 1947 continued a fifteen-year decline, statisticians of the Metropolitan Life Insurance Company revealed recently The trend was viewed as due largely to the nation-wide anticancer campaign which has helped to make women more alert to early danger signals of the disease

Among the company's white female industrial policyholders the age-adjusted death rate has decreased from 93 5 for each 100,000 in 1932–1934 to 82 9 in 1947, a reduction of 11 per cent The company stated, however, that in spite of the gains which have been made, 100,000 women in the United States are expected to die of cancer and other malignant tumors in 1948, and this death toll, second only to that from heart disease, is expected to rise as the number of older women in the population increases

MEETINGS

FUTURE

Moreno Clinic and Psychodramatic Institute

The third and fourth national conferences, sponsored by the Moreno Clinic and the Psychodramatic Institute, will be held November 27 and 28 and December 26, 27, and 28 at Beacon, New York The conferences will cover psychodrama, sociodrama, sociometry, and group psychotherapy, and the theme will be "Training in Human Relations"

Further information may be obtained by writing to the Moreno Clinic, Beacon, New York

American Medical Association, Interim Session

The Interim Session of the American Medical Association will open in St Louis, Missouri, on November 30 and continue through December 3 All activities, including meetings of the House of Delegates, general lectures, clinical presentations, scientific exhibits, technical exhibits, motion pictures, and television, will be concentrated in the Kiel Auditorium in St Louis

The program includes a general session on Tuesday and Thursday evenings, with entertainment on Wednesday evening The second annual General Practitioner award will be presented on Thursday evening

Institute of Industrial Medicine

HOSPITAL NEWS

Safety Methods for Hospital Personnel

INAUGURATION of a special course in Safety for Hospital Personnel in cooperation with the New York University Center for Safety Education, New York City, was announced recently by Louis Schenkweiler, president of the Greater New York Hospital Association, representing 97 voluntary nonprofit and 22 municipal hospitals in the metropolitan area

Dr Walter Cutter, assistant professor of industrial safety, New York University, and consultant to the Secretary of the Army on training in accident prevention, urged hospital authorities to continue their efforts to reduce accidents among their personnel Dr Karl Klicka, a member of the American Hospital Association's Council on Safety, commended the local Association for its cooperation with the national campaign of the National Safety Council and American Hospital Association for increased safety in hospitals

Hospital Council Names Five

NORMAN S GOETZ, president of the Hospital Council of Greater New York, announced recently the election of five new members to the council's board of directors for three-year terms The new members are James W Husted, Dr Howard A Rusk, Miss Winifred Fisher, Nathan S Sachs, and T J Ross Members re-elected for three-year terms were

Arthur A Ballantine, Dr Jean A Curran, Dr Haven Emerson, Dr Morris Hinenburg, and Raymond P Sloan Dr John B Pastore is executive director of the Hospital Council

Columbia Announces Course in Bronchopulmonary Diseases

COLUMBIA University, College of Physicians and Surgeons, announces a course in "Physiologic Therapy in Bronchopulmonary Diseases" to be given Monday through Friday, January 24 to 29, 1949, by Drs A. L Barach, H A. Bickerman, and C Eastlake

The course will deal with the principles of physiologic and antibiotic therapy of bronchial asthma, pulmonary emphysema and fibrosis, chronic bronchitis and bronchiectasis, and pulmonary tuberculosis The application of technics will be demonstrated on cases receiving inhalational, aerosol, and immobilizing lung chamber therapy This part of the program is available for veterans

For further information, apply to Dr John B Truslow, assistant dean, Columbia University, College of Physicians and Surgeons, 630 West 168th Street, New York City

Cancer Study Clinic Planned at Sydenham

SYDENHAM Hospital, New York City, has completed preparations for a project in clinical cancer research, Dr Jacob Heiman, chief of the medical service and chairman of the medical board, announced recently

The project has two objectives, Dr Heiman announced It is aimed at an understanding and possible prevention of certain types of tumors commonly associated with internal gland, or endocrine, secretions, and at an understanding of "what may be going on in the patient which may produce a tumor recurrence," in the hope that if this can be determined recurrent tumors may be prevented While the study is in progress and following each tumor operation, patients will be referred to the hospital's tumor clinic to be placed under surveillance

NEWS NOTES

Formal opening of the new $1,500,000 wing of St Peter's Hospital, Albany, will take place November 21, Sister Mary Esther, hospital administrator, has announced The new wing will increase to 300 the capacity of the hospital, which at present has 159 beds

The first step toward actual construction of the Community Memorial Building, the $1,500,000 addition to the Lawrence Hospital, Bronxville, will begin this fall, it has been announced Altering the course of the Bronx River at the rear of the site will be the first move toward the erection of the new structure, which is to be completed by December, 1950

Emergency medical care for Geneva citizens on Wednesday afternoons, Sundays, and legal holidays will be provided, according to a resolution adopted recently by the staff of the Geneva General Hospital and announced by Dr George H R White, president of the staff, and Dr Kenneth Ward, chairman of the committee arranging the service

According to the plan, one member of the staff will be on call on each of the designated days from noon to 11 P M Persons unable to obtain the services of their regular physician at the specified times may call the hospital and obtain the name of the physician on call

The revised plans for Massena's new 87-bed hospital, to cost not more than $750,000, were approved by the town board at its September meeting The building will provide for 87 beds, including 12 beds for children, and 26 bassinets There will be 31 private rooms and three rooms for isolation cases

Brooklyn's fifth cancer prevention and detection clinic has opened at the Jewish Hospital of Brooklyn, it has been announced by Dr S Potter Bartley, chairman of the Brooklyn Cancer Committee

Following a questionnaire survey of public opinion by the board of managers of the Hospital at Sidney, it was indicated that 96 per cent of those replying believed that the Hospital should be enlarged, and 94 per cent favored raising funds for the expansion through a subscription campaign

Owned and operated by the town of Sidney, the Hospital has 30 beds Present plans call for construction of a new wing containing 20 additional beds and improved office and admitting space, together with some reconstruction in the existing building The goal of the fund was oversubscribed in the campaign

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Executive Board Holds Fall Meeting

THE fall board meeting of the Woman's Auxiliary was held October 18 and 19 in Syracuse, with Mrs Edgar M Neptune, State president, presiding, and officers, committee chairmen, county presidents and presidents-elect attending

Reports of officers and chairmen were presented in a bound theme book, "Ladder to Auxiliary Success," showing the varied activities of the county auxiliaries and State committees Emphasis for 1948 and 1949 is on an "alert, informed, active membership"

On October 18, Dr Leo F Simpson, president of the Medical Society of the State of New York, and Dr Norman S Moore, chairman of the nutrition committee of the American Medical Association, spoke at a dinner for the group Dr Simpson pointed out that one aim of the State Society should be to get people to realize the importance of the medical care programs now being offered, and suggested that the Society and the Auxiliary use their connections with civic, social, and other organizations to help the medical profession determine what the public wants in terms of health care He paid tribute to the Auxiliary for its work. Dr Moore discussed nurse recruitment, explaining that the Auxiliary might aid in coordinating the various members of the medical family—the hospital, the doctor, and the nurse—into one group

At a luncheon on October 19, Dr Clealand R Sargent, Syracuse City Health Commissioner, spoke on public health, giving a brief survey of public health problems and detailing the attitude of the public health department on socialized medicine

During the business sessions, reports of county presidents were heard, and a general discussion of county auxiliary problems held Approximately 100 members of the State Auxiliary attended the sessions

COUNTY NEWS

Albany County

Voting to establish a nurses' scholarship fund, the Woman's Auxiliary to the Albany County Medical Society held a benefit card party and food sale on October 27, with the proceeds to be used for the fund The scholarship will be available to a high school graduate from Albany County A feature of the party was a style show with Auxiliary members serving as models

On Wednesday, November 17, the group will hold a membership tea to welcome new members of the Auxiliary

Broome County

The Broome County Woman's Auxiliary opened its fall season with a luncheon at the Binghamton Club, Binghamton, making plans to assist at the Sixth District Branch meeting on October 6 Auxiliary guests at the District Branch meeting visited the International Business Machines building for an afternoon program and tea.

The Auxiliary also assisted at the annual Broome County health fair and worked to secure donors for the Red Cross blood bank

Chautauqua County

On September 23 the Chautauqua County Woman's Auxiliary met for a luncheon meeting at the Cassadaga Valley Country Club, with 25 members present and Mrs Calvin Clark Torrance, president, in charge of the business meeting Reports by the officers and committee chairmen were made

Guest speaker at the meeting was Miss Catharine Locke, of the business staff of the Brook's Memorial Hospital, Dunkirk, who gave a review of the book, *Hongkong Holiday*, by Emily Hahn Miss Locke was introduced by Mrs Benjamin Custer, Fredonia.

Columbia County

Dr J L Edwards spoke on the Wagner-Murray-Dingell Bill at the meeting of the Columbia County Auxiliary held September 28 in Hudson Mrs H J Noerling presided at the luncheon meeting

Erie County

Recent activities of the Erie County Woman's Auxiliary have included a business meeting on September 28, a benefit dessert bridge in October, assisting at the first International Congress of Hematology, sponsored by the University of Buffalo, and distribution of posters for public health night, held September 22 in Buffalo In addition, several members of the Auxiliary attended the fall board meeting in Syracuse on October 18 and 19

The membership and hospitality committees are planning a Christmas tea to welcome and honor new and prospective members.

Genesee County

Members of the Genesee County Auxiliary were hostesses to the auxiliaries from six counties in the Eighth District Branch at the annual branch meeting on September 16 in Batavia Guests were entertained at a theater party and tea, and discussions on projects for county auxiliaries were held Mrs Charles Mann, president of the Genesee County Auxiliary, Mrs Raymond Warn, treasurer, and Mrs Sidney McLouth, secretary, were in charge of arrangements

Madison County

The Madison County Woman's Auxiliary opened its fall and winter season with a tea at the home of the president, Mrs Eugene W Carpenter, Oneida, on October 12, with wives of all physicians in the county invited

The committee in charge of arrangements included Mrs Charles A. Earl, Mrs Edmund L Finley, and Mrs J Frederick Rommel, Jr Mrs

[Continued from page 2548]

Robert L Crockett and Mrs Otto Pfaff presided at the tea table

Monroe County

Four meetings have been planned for the year by the Monroe County Woman's Auxiliary, with the first on September 15 having been a benefit style show at the Seneca Hotel, Rochester On Friday, November 12, Mr Thomas E Walsh, field representative of the Public Relations Bureau of the State Society, spoke on "Chiropractic and other Legislative Matters"

A panel discussion on "What Every Doctor's Wife Should Know" will feature the meeting on February 11, 1949, and the annual luncheon and election of officers will be held on April 8, 1949 Yvelin Gardner, assistant to the executive director of the National Committee for Education on Alcoholism, will be the guest speaker

Nassau County

During September, members of the Nassau County Woman's Auxiliary worked with the county society at the Mineola Fair The cancer committee sponsored the "Talking Mirror" and the medical society, a scientific booth, both being staffed by Auxiliary members

A membership tea was held on September 30 at the Nassau County Hospital auditorium, with 80 attending Mrs John L Neubert, Auxiliary president, welcomed the guests, and Mrs Nathaniel Robbins, Hempstead, and Mrs E Freeman Miller, Freeport, past presidents, presided at the tea table

Oneida County

The Oneida County Woman's Auxiliary held its first fall luncheon meeting October 12 at Dibble's Inn, Vernon Mrs Edgar M Neptune, Syracuse, State Auxiliary president, and Mrs Neil Paul, Syracuse, vice-president of the Onondaga County Auxiliary, addressed the group

Reporting on the nurses' scholarship program, Mrs G L Higgins announced that five scholarships were awarded this year and that funds are available for another Plans were made to continue the program and to raise funds so that the number of scholarships awarded may be increased

Orange County

The regular monthly meeting of the Orange County Auxiliary on October 12 was in the form of a membership tea, with Mrs Harry F Pohlmann as hostess and 34 members and prospective members present Plans were completed to make a donation to the Physicians' Home and to set up a recruitment committee for student nurses

The Auxiliary participated in the meeting of the First District Branch at Newburgh on October 26 by acting as hostesses to the auxiliary members present from other counties, and by handling the registration of physicians at the meeting

Queens County

Activities for the Queens County Auxiliary have included a meeting on October 26, with Mrs Clifton L Dance, Second District Branch Counselor, as guest speaker, a reception on October 24 to honor Mrs William LaVelle, who has been chosen president-elect for the State Auxiliary, and participation in activities of the branch and State meetings

On November 13, a benefit dinner dance was held at the North Hills Country Club, with the proceeds to be used to purchase equipment for ill children in the various Queens' institutions

Saratoga County

Members of the Saratoga County Woman's Auxiliary met on October 5 at the Nurses Lounge at the Saratoga Hospital. Mrs Thomas E Bullard, Schuylerville, past-president, spoke on "Our Colored Brethren"

At a recent executive board meeting, at which Mrs Bullard was hostess, plans were made for a rummage sale and a silver tea, both funds to be used for aid to a student nurse or medical student

At the Saratoga County Fair in August, the group maintained a booth where literature on social medicine, rheumatic fever, cancer, and the Spa development was distributed Mrs M E. Van Aernam was in charge of the booth

Schenectady County

Plans for the year were made at the first executive board meeting of the Schenectady County Woman's Auxiliary, held September 22 at the home of Mrs Gomer Richards, Schenectady, president of the group

Activities discussed included regular programs for the year, distribution of a questionnaire to determine interests of the members, a study of a possible nurse scholarship program, and a project to acquaint new members with the history of the group

Suffolk County

The Suffolk County Woman's Auxiliary awarded three nurses scholarships to girls who entered training in September In order to raise funds to continue this project, the second annual Nursing Scholarship dance was held by the Auxiliary at the Patchogue Hotel on October 16

At the regular meeting on October 27, an educational motion picture on heart disease, entitled "Act Your Age," was shown

---

TUBERCULOSIS DEATH RATE

The more rapid decline of the tuberculosis death rate in younger age groups and the gradual aging of the population have resulted in an increasing proportion of tuberculosis deaths in the ages over 45 Tuberculosis among older people is often unsuspected because the disease has long been considered the particular foe of youth Although tuberculosis remains the leading cause of death from disease in the ages 15 to 35, the tuberculosis death rate increases steadily with age from a minimum in childhood to a maximum at 75 years of age —*Tuberculosis Abstracts, September, 1948*

why this is the ideal phenobarbital preparation for children . . .

ESKAPHEN B ELIXIR

1 Its fluid form makes it easy to take

2 Its good taste makes it pleasant to take

3 Its calming action is supplemented by the tone-restoring effect of thiamine

And this is important, too Parents who "know all about phenobarbital"—and might be upset at the idea of giving it to their children—won't know you are prescribing phenobarbital when you write ESKAPHEN B ELIXIR

Smith, Kline & French Laboratories, Philadelphia

Each teaspoonful (5 cc) contains phenobarbital 1/4 gr and thiamine 5 mg

ESKAPHEN B ELIXIR

The delightfully palatable combination of phenobarbital and thiamine

Experience is the Best Teacher

R. J. Reynolds Tobacco Co., Winston-Salem, N. C.

John William Ballantyne

(1861 1923)

proved it in obstetrics

BALLANTYNE, in his early studies of anatomical and pathological conditions found in the new born, sensed the value of routine prenatal care in obstetrics. At the same time other obstetricians were beginning to realize the necessity of greater attention during the ante partum period as a result of their investigations of eclampsia. It remained for Ballantyne, however, to be the first to establish a clinic for the expectant mother. World wide acceptance of his concepts quickly followed Ballantyne's successful experiences in prenatal supervision.

EXPERIENCE IS THE BEST TEACHER IN CIGARETTES, TOO!

Yes, experience *is* the best teacher in choosing a cigarette! Millions of smokers who have tried and compared many different brands of cigarettes have found that Camels suit them best.

Try Camels. See if your *own* taste doesn't appreciate the rich, full flavor of Camels. See if your *own* throat doesn't welcome Camel's cool, cool mildness.

Let your own experience tell you why with scores of smokers who have tried and compared Camels are the "Choice of Experience."

According to a Nationwide survey:

More Doctors Smoke CAMELS than any other cigarette

In a nationwide survey by three independent research organizations, 113,597 doctors were asked to name the cigarette they smoked. More doctors named Camel than any other brand.

pH ... determining factor in restorative vaginal treatment

Acidity of the vaginal secretions is the prime requisite for the favorable growth of the protective Doderlein bacilli

Normal acidity of pH 3 8 to 4 4 is maintained by the conversion of the glycogen in the epithelium to lactic acid *

Treatment of trichomonal vaginitis, therefore must not only furnish a trichomonacide but "must furnish sugars to be stored as glycogen *

FLORAQUIN—a product of Searle Research—not only contains Diodoquin-Searle (5,7-diiodo-8 hydroxyquinoline) a potent trichomonacide, but also supplies lactose dextrose and boric acid for restoring depleted glycogen and reestablishing a normal pH range (3 8–4 4) unfavorable to vaginal infections.

FLORAQUIN POWDER—for office insufflation.

FLORAQUIN TABLETS—for patient s use

Floraquin nd Diodoquin are the registered trademarks f G D Searle & Co., Chicago 80 Illinois.

The newest **giant stride**

in penicillin therapy

DEPO* penicillin

MAINTAINS THERAPEUTICALLY EFFECTIVE BLOOD LEVELS FOR 96 HOURS IN THE MAJORITY OF PATIENTS

Upjohn is privileged to announce the newest in the series of giant strides in penicillin therapy —DEPO-PENICILLIN—96-hour therapeutically effective blood levels made possible with a single injection of Upjohn's uniquely prepared Crystalline Procaine Penicillin G suspended in Peanut Oil containing 2% W/V Aluminum Monostearate. The Upjohn process of suspending smaller than 5 micra particles of Crystalline Procaine Penicillin G in Peanut Oil gelled with a dispersing agent also affords a free-flowing preparation which may be kept at room temperature. DEPO-PENICILLIN is recommended for use in all those conditions in which other forms of repository penicillin have been indicated.

adrenolytic and sympatholytic vasodilator

PRISCOL

"a valuable adjunct to the treatment of peripheral vascular disease"[1]

Priscol hydrochloride, administered either orally or parenterally counteracts the constrictive effect of epinephrine-like substances which are formed at the vascular myoneural junction

Priscol therefore produces circulatory improvement in many cases of Raynaud's disease Buerger's disease diabetic gangrene and arteriosclerotic peripheral vascular disease.

Patients should be closely observed until optimal dosage is established since paradoxical effects or orthostatic hypotension may occur

Issued: Tablets of 25 mg bottles of 100 and 1000
10 cc. Multiple-dose Vials each cc. containing 25 mg

safer,
more effective
sulfonamide therapy

In charting a safe course accurately the modern navigator's sonar depthfinder surpasses the sounding line In chemotherapy the modern method of combined sulfonamide administration excels in safety and therapeutic efficiency

COMBISUL*— pioneer sulfonamide combination — virtually eliminates the hazard of renal irritation from large doses of single sulfonamides By permitting simultaneous administration of partial doses of the three most widely applicable sulfonamides — each independently soluble in the same medium — greater urinary solubility is achieved

COMBISUL

(COMBINED SULFONAMIDES)

is more rapidly and completely absorbed and produces higher total sulfonamide blood and urine levels than equivalent doses of any one of its components This affords higher clinical efficacy on a gram for gram basis.

COMBISUL Tablets 0.5 Gm., provide 0 166 Gm. each of sulfadiazine, sulfathiazole and sulfamerazine. COMBISUL Liquid is a palatable suspension containing 0 166 Gm of each of the same sulfonamides per teaspoonful Indications are the same as for the individual components of the mixture

COMBISUL TABLETS 0.5 Gm. in bottles of 100 and 1000
COMBISUL LIQUID 0.5 Gm. per 4 cc. in bottles of 4 and 16 oz.

Schering CORPORATION BLOOMFIELD NEW JERSEY

Outstanding

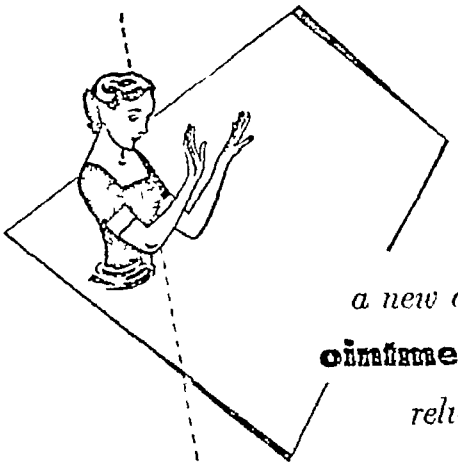
IN TOPICAL ANTIBIOTIC THERAPY

LOW INDEX OF ALLERGENICITY—Bacitracin is outstanding in that its application topically is only rarely complicated by allergic manifestations It therefore possesses a distinct advantage over many other antibiotics, freeing topical antibiotic therapy from this formerly serious limitation

WIDE RANGE OF EFFECTIVENESS—While its spectrum of action largely parallels that of penicillin Bacitracin is destructive to many strains of pathogens which are penicillin fast Thus it broadens the scope of antibiotic therapy and enhances its therapeutic efficacy

PROMPT ACTION—Injected in solution into the base of pyogenic lesions, or applied topically in the form of an ointment Bacitracin acts promptly upon the bacterial invasion Response is apparent in most cases within a short period

INDICATIONS—Bacitracin topically administered is indicated in the treatment of many deep pyogenic lesions of the skin superficial cutaneous pyogenic lesions, and many external ocular infections due to Bacitracin-sensitive organisms. Bacitracin is administered topically only



Bacitracin in dry form for making solutions is supplied in 20 cc serum type vials containing 2 000 and 10 000 units, and in 50 cc. vials containing 50 000 units. Also available as Bacitracin Ophthalmic Ointment in ⅛ ounce tubes and as Bacitracin Ointment in ½ ounce tubes both containing 500 units per Gm Literature available to physicians on request.

Soft Diet
trying your patients' patience?

—try palatable Swift's Strained Meats

Tempting, natural source of complete protein

6 varieties

The things some patients on soft, smooth diets have to eat! It's no wonder appetites lag.

To perk up patients' interest in food many doctors now prescribe specially prepared Swift's Strained Meats when soft foods are indicated in a high protein, low residue diet. They help two ways. *One*: Swift's Strained Meats taste so good. Few patients can turn down real meat goodness. *Two*: an excellent source of B vitamins, Swift's Strained Meats help restore patients' natural appetite for all foods.

Originally prepared for infant feeding, Swift's Strained Meats are soft, smooth (may easily be used in tube feeding), slightly salted—cooked to retain all their delicious meat flavor. Six kinds for variety: beef, lamb, pork, veal, liver, heart. Each one 100% meat, they provide an excellent, palatable source of complete high-quality proteins and hemapoietic iron. These meats make available *simultaneously* all known essential amino acids for optimum protein synthesis. Convenient—Swift's Strained Meats are ready to heat and serve.

The makers of Swift's Strained Meats invite you to send for your copy of "The Importance of Protein Foods in Health and Disease"—a physician's hand book of protein feeding, written by a doctor. Send to

Editorials

Stop, Look, Listen, I

Attention of readers of this JOURNAL is directed to careful study of the twelve resolutions adopted at the General Assembly in Geneva, September 8 to 11, 1948, of the World Medical Association [1] These call for

1 Freedom of choice of physician by the patient. Liberty of physician to choose patient except in cases of urgency or humanitarianism.

2. No intervention of third party between physician and patient.

3 Where medical service is to be submitted to control this control should be exercised by physicans

4. Freedom of choice of hospital by patient

5 Freedom of the physician to choose the location and type of his practice

6. No restriction of medication or mode of treatment by physician except in case of abuse

7 Appropriate representation of medical profession in every body (official) dealing with medical care.

8 It is not in the public interest that physicians should be full-time salaried servants of the government or social security bodies.

9 Remuneration of medical services ought not to depend directly on the financial condition of the insurance organization.

10 Any social security or insurance plan must be open to the participation of any licensed physician, and no physician should be compelled to participate if he does not wish to do so

11 Compulsory health insurance plans should cover only those persons who are unable to make their own arrangements for medical care

12 There shall be no exploitation of the physician the physician s services or the public by any person or organization.[1]

Without dissent these principles were adopted by the delegates with the objective of the

promotion of closer ties among the national medical organizations and the physicians of the world, the maintenance of the honor and dignity of the medical profession, mutual consideration of professional problems of the medical profession in the different countries and exchange of information on matters of interest to the medical profession, the establishment of proper relations with similar groups (such as the World Health Organization the United

[1] J.A.M.A 138: 436 (Oct. 9) 1948

Nations Educational, Scientific and Cultural Organization), improvement of health throughout the world, and the promotion of world peace, aims which merit the support of every physician [2]

In discussing the twelve resolutions above cited, Dr Louis H Bauer, past president of the Medical Society of the State of New York, and secretary-general of the W M A, stressed the fact that

> Social insurance is in process of expansion almost everywhere, and particularly in Europe The International Association for Social Security and the International Labour Organization appear to be resolved to encourage a complete program of social insurance, embracing medical service for the entire world The Council of the World Medical Association recommended to the General Assembly at Geneva the initiation of an extensive inquiry, detailed and precise, to be reported on by the national medical associations with the view of arriving at correct information on the status of the subject in each country A permanent committee on social insurance was appointed by the General Assembly This committee will make every effort that doctors be not outdistanced in the matter of social security by the International Conference, which carries on its work on a permanent scale It is a matter of regret that, because of lack of organization, doctors always find themselves faced with accomplished facts when it is too late to suggest and to bring about modifications of decisions already taken [1]

Proponents of social security schemes and administrators of those already in operation are advocates of, and dependent upon, a captive medical profession Why? Because any insurance or social security scheme must be medically policed It is of no significance that the doctors wear no visible uniform, cap or badge—they are police agents of the scheme, whatever it may be

The delegates to the Geneva conference of the W M A are realists, as doctors they have to be, as citizens of many countries with long experience in fact of the actual operation of social security and insurance schemes they are embittered, disillusioned realists Can a realist be embittered? It would seem so in the sense that a pessimist can feel pain if in contact with a hot stove, for example Of this experience he can warn others The delegates have voiced their warnings in the twelve resolutions reprinted herewith

It is one thing to warn a profession and quite another to have those warnings translated into effective action Does anyone think those twelve cited warning resolutions were written merely to fill a vacuum? No, they are a call to action on a world-wide front, a hard core around which to carry on an aggressive, positive and effective resistance movement against the kind of thinking and scheming which would make of the medical profession a captive, a cat's paw, a servile tool of some soulless state

There is something every doctor of medicine can do about it He can become a supporting member of the United States Committee of the World Medical Association He can thus lend his moral and financial aid to the promotion of higher levels of medical care and public health throughout the world, and to the development of better international relations Do it now Send your contribution to World Medical Association, 2 East 103rd Street, New York 29, New York

Into the Open

"United Medical Service has declined to pay hospital vendors of professional service through the agency of an intern, a resident, or salaried doctor "[1]

We have been waiting for an announcement of this kind for too long a time Like every other, the medical profession suffers from inequalities within its ranks Such inequalities are inevitable—to a certain extent They arise from divergencies of ability, of opportunity, of political sagacity, of family and financial background

Practitioners fortunate in possessing the qualities we have mentioned usually attain

[1] U M S Medical Bulletin 3 0 (Sept) 1948

important hospital appointments, and/or university professorships. There is no quarrel with those who do In the majority of instances, cream rises inevitably to the top But we submit that the rise of the cream should stop there

Some hospitals have found it advantageous to pay salaries to members of their staffs Such monies as they may earn over and above their salaries go to the maintenance of the institution that supports them Universities have done the same thing Full-time professors are paid salaries. Their title and prestige attracts private patients, whom the professors are forced to treat whether or not they wish to do so, and what they earn over and above their salaries goes into the maintenance funds of their departments. Both practices sound eminently reasonable and fair to the trustees of the institutions, and to the few who receive the salaries, who prefer to accept a certain fixed yearly income, rather than to engage in the turmoil of ordinary private practice with its fluctuations of income, its dependence upon personal friendships, political adroitness, feeders and perhaps less savory methods of procedure

The medical profession is as full as any other of men whose wives complain that "all God's chillun got shoes—except her" Nor are doctors' hearts any more hardened than those of any other profession against the legitimate laments of their suffering families It is indeed surprising that as many doctors are as honest as they are For example, no one can testify with certainty that a patient is any worse off for having been relieved of a pair of cryptic tonsils or chronic appendix

Are we to subject the profession to further strains? Are the most respectable elements that support it to be allowed to contribute to its moral downfall? A doctor who holds any kind of a hospital appointment has a great advantage over one who does not Are we to submit passively to a further advancement of that advantage by encouraging hospitals and universities to pay him a salary to make money out of him, to pull the wool over his eyes by giving him free office space, secretaries, prestige?

Is that free enterprise? The question is at least debatable How many of the medical profession realize how nearly we parallel the worst kind of trade unionism with our specialty boards, our colleges of physicians and surgeons? We know very well that these institutions were conceived in the spirit of elevating the standards of the medical profession, and to a great extent they have done so But then, as everyone who has lived through two wars ought to know, the tide has turned the other way, and movements that started in virtue end up hardly distinguishable from the worst closed shop in their injustices

Abraham Lincoln remarked that a nation could not exist half slave and half free. Is his observation equally true with regard to the medical profession? The United Medical Service may be a little late in pronouncing, in no uncertain words, its verdict upon the questionable practices hitherto sanctioned in silence by the two most respectable bodies of men that should have the honor and the honesty of the medical profession near to their hearts These are the trustees of hospitals and the deans and boards of trustees of our university medical schools

Mr Lincoln's verdict that a nation could not exist half slave and half free has been amply vindicated It is praiseworthy that the United Medical Service has at last made a pronouncement of equal importance to the medical profession and we congratulate U M.S for its courage in having done so It will not pay "hospital vendors of professional service through the agency of an intern, a resident or salaried doctor"

Current Editorial Comment

Nonservice-connected Disabilities a Problem.

In a summary of its activities as of August 31, 1948 the Veterans Administration reported a total of 10,048 patients in hospitals of the 92,983 in Veterans Administration hospitals

61,091 were veterans with nonservice-connected disabilities, of the 12,065 patients not in Veterans Administration hospitals, 7,488 were veterans with nonservice-connected disabilities In addition, there were 14,342 beneficiaries in Veterans Administration homes

Eighty-nine new hospitals were in progress at the end of August, of which the construction contracts had been awarded for 28, the designs were in progress in 50, the designs not started in three, and the designs completed but construction contracts not awarded in eight Through the end of the month, 63 sites have been acquired for new veteran hospitals, 20 specific sites have been approved but not acquired, seven specific sites were in the process of selection, furthermore, 31 additions and conversions to the hospital addition and conversion program had been completed throughout the month and seventeen other additions and conversions were in progress

At the end of August, 18,560 veterans were awaiting hospital admission, of these 18,490 had disabilities adjudicated nonservice-connected, 77,277 applications for hospital or domiciliary care were received through the month, and 33,679 applications were filed for automobiles for disabled veterans [1]

The large number of nonservice-connected disabled may be expected to increase with the years The stresses of civilian existence are becoming such that it is not inconceivable that the distinction between such disabled and service-connected may have to be abolished eventually Is it significant that, as reported, 18,490 out of 18,560 veterans awaiting hospital admissions at the end of August, were nonservice-connected?

[1] J A M.A. 138 438 (Oct. 9) 1948

Of This and That The J A M A advises and this JOURNAL urges the utmost vigilance vis-à-vis the antivivisectionists and their legislative maneuvers [1]

As predicted when the antivivisectionists were exposed by the *Saturday Evening Post*, the magazine later was deluged with mail, some of which was commendatory, and some condemnatory One antivivisectionist went so far as to threaten to use his rifle on experimenters The *Post* publishes two columns of letters pro and con, one demands "Answer yes or no Are you or are you not going to print the other side of the vivisection question?" The following answer of the editors of the *Post* to this demand is significant "We made an exhaustive study of the pros and cons of vivisection before we published "They're Trifling with Your Life" Not one valid argument in support of the antivivisectionist viewpoint was found This being the case, we feel no obligation to publish anything more than the comments in these columns"[2-4] This ought to settle the antivivisectionist argument, but it will not The antivivisectionists are not capable of being convinced, and continued vigilance by physicians and other scientists will be necessary The antivivisectionists need constant watching even though they have not thus far achieved important legislative results [1]

In anticipation of the 1949 legislative session in New York State, we advise all those who have not done so to read carefully the original article of Dr Moon in the *Post*, and to refer to the editorial in this JOURNAL in which Dr Moon's article was briefly excerpted [5]

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Diet Inventory Methods for Doctors, I

The importance of the diet in both the preservation and the restoration of health is now generally known to alert physicians With this increased appreciation of the role that the diet plays, there is better understanding of the specifications for an adequate diet Because the physician knows, in spite of idiosyncrasy and custom, that a patient's diet must have calories and essential nutrients, he is in need of simple methods by which he can quickly evaluate a patient's food intake in terms of essential nutrients In hospitals and clinics the latter task is performed by a dietitian or nutritionist. Many physicians find it necessary, however, to inventory their patient's dietary status themselves. All physicians should become familiar with diet inventory methods and current technics, because much information about patients comes to light for the first time in a diet history The purpose of this article is to acquaint physicians with methods of interviewing which are successfully used by trained nutritionists when taking a diet history Two ways of determining a patient's food consumption are by personal interview or by a diet record kept at home by the patient In many instances a combination of the two methods is desirable, the information received from one source supplementing the other

Securing a factual diet history requires time, patience, and insight. Information on diet habits may prove to be more significant and more revealing than the actual food intake. It is therefore necessary to inventory many practices which influence food consumption A discussion of these practices should include the regularity of meals Many patients eat with no regularity, consequently they are frequently deprived of certain essential nutrients because of fluctuation in appetite or the habit of obtaining quick calories, usually weighted with carbohydrates The number of meals missed should be known to the physician, because patients who go without breakfast or lunch often at the evening meal double the calories missed during the day The usual time allowed for each meal reveals considerable evidence about the patient's emotional drive and tension and may be directly related to other symptoms, especially those involving the gastrointestinal tract Knowing with whom meals are usually eaten may help correlate the diet inventory with the medical history Persons who eat alone, or with someone with whom they are in conflict, often do not take sufficient calories or too many It has long been known that some worried, depressed or anxious people lose weight and that others overeat The latter fact appears to account for more cases of obesity among young people than does hormonal imbalance.

Many patients have pronounced likes or dislikes regarding certain foods The physician should ascertain the specific foods that are not liked Where meals are eaten should also be noted In some cases the money available or spent for food, in other cases the preparation and storage facilities available, or the kind and amount of supplements taken, will account for an unsufficient intake of essential nutrients. Data concerning exercise must be obtained and evaluated Likewise the use of laxatives and other drugs, especially the regularity as well as the amount consumed daily, should be known to the physician It is well for the doctor to

have information regarding the method used in the preparation of food One frequently finds a deficiency intake of water soluble vitamins because they had been extracted by the cooking water which was discarded

For the actual food intake, it is well to find out what the patient's customary breakfast, lunch, dinner, between meals, and before bedtime eating pattern is In the latter two instances the time and kind of food eaten may be revealing The object of a diet history is to ascertain the usual intake of food and the variation of this pattern Since many people are not aware of what they eat, one should be suspicious of the patient who recalls too easily It takes time and skill in follow-up to help them recall There is a small group in whom habits are so irregular that it is impossible to get a pattern After the diet history has been completed, it is a good policy to check on the daily consumption of certain important foods how much milk is consumed per day, how many eggs per week, etc If the answers do not check fairly well with the totals consumed at breakfast, lunch, dinner and between meals, the discrepancies should be "questioned out" In some instances it may be necessary to check the amounts of certain items of known composition that are purchased by the family

A diet record kept at home by the patient may be a useful adjunct A straight diary giving the following information may be used the time of day when food was eaten, the place where food was eaten, and the actual food eaten, with a description of mixtures and amounts The patient should be given careful instructions and told by what measurements the food should be recorded It is desirable that the record cover one week's intake, however, if a patient will not cooperate to that extent, three days including a weekend day will suffice Such a diet record frequently brings realization to the patient of what his real diet habits are

Now for the evaluation of the information by the time the diet data are recorded one may already have the answer The diet history may be evaluated in either a qualitative or quantitative manner The quick history taken in the office usually does not warrant, however, more than a qualitative analysis which is made most easily by comparison to an arbitrarily chosen dietary pattern

In the next issue the discussion of "Diet Inventory Methods for Doctors" will be continued and will be focused on comparative standards that the physician may use in evaluating data which he obtains from a diet history Whether a diet inventory is obtained by an interview or by means of a patient's diet record, a file card on which are printed headings for questions and space for data will be found useful Such a card which can be used for a permanent record has been prepared by the medical nutrition group of the School of Nutrition at Cornell University, and a sample card is available on request to either the editor of this JOURNAL or the director of the School of Nutrition at Cornell

Scientific Articles

COMPLETE PROLAPSE FOLLOWING HYSTERECTOMY

MORTIMER N HYAMS, M D F A C S, New York City

HYSTERECTOMY of any type must in some degree interfere with the normal anatomic supports of the uterus Conceding this to be true, it would be a logical supposition to anticipate prolapse of the remaining tissue structures as a natural sequence in some cases Judging from the relatively few references to this lesion which have appeared in the textbooks and gynecologic periodicals it would appear that it is not of frequent occurrence. Hamilton of England who made a survey of the literature and published his findings in 1943, stated that there are only a few references to the occurrence of this postoperative complication and that he had not discovered any paper directly concerned with the subject [1] From the fact that so few case reports or references could be found, he concluded that prolapse following hysterectomy must be comparatively rare. Considering the large number of uterine excisions performed in which bilateral oöphorectomy is also carried out, he thinks it strange that the induced *artificial menopause and its associated* loss of tissue tone does not increase the incidence of procidentia.

A recent survey of the literature shows an incidence of only 21 recorded cases of prolapse in 3,652 hysterectomies and six such complications reported by Culbertson and Phaneuf in which the total number of operations was not stated [2 3] Read and Bell and Davidson performed 770 total abdominal hysterectomies with only one case of subsequent prolapse, while in 283 vaginal hysterectomies performed by Babcock and Vineberg this complication never followed the operative procedure [4-7] In their series, six were recurrences following an antecedent operation for prolapse

Hamilton reported five of his own case histories three being subtotal, in which prolapse followed hysterectomy [1] Siddal and Mack cite one case, while Davis and Cusick in their series had no such complication following operation [8 9] McEwan in summarizing his hysterectomies, mostly subtotal claims that the operation actually cures upper vaginal prolapse [10] From the foregoing it is evident that many cases of postoperative prolapse have either been overlooked undiscovered, or not considered of sufficient import to merit a report which may account for the few references to the condition. Unsatisfactory or neglected follow up may explain other unreported cases. From the figures available, it appears that the subtotal is followed by five times as many cases of prolapse as the total excision of the uterus This could be cited as an operative disadvantage but considering Kennedy's estimate that 95 per cent of all hysterectomies performed in this country are of the subtotal type carried out by operators of varying degrees of skill and experience whereas total hysterectomy is usually done by the more experienced surgeons and in carefully selected cases, the five to one ratio of prolapse following subtotal operations does not appear so formidable [11] I do not intend to enter the controversial field of total versus subtotal hysterectomy but will confine *myself to the problem of* prolapse following the subtotal type and the presentation of an operative procedure a modification of the Kocher ventral fixation, which in my experience has given entirely satisfactory results with no complications or unsatisfactory postoperative sequelae

The care and management of the retained cervical stump is still a subject on which there is no consensus of opinion Many gynecologists believe that the cervix should not be retained when the corpus is removed Richardson pointed out that subtotal hysterectomy is properly applied to only four types of cases

1 Patients requiring hysterectomy for benign disease who possess perfectly normal cervices

2 Instances in which the operative hazard compels the execution of rapid and conservative surgery

3 Cases where for good and sufficient reason it is of paramount importance to preserve the menstrual function

4 Cases requiring hysterectomy during pregnancy [12-14]

He concludes that because of the reprehensible

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Obstetrics and Gynecology May 19 1943.

prevalence of benign diseases of the uterine cervix, notwithstanding its many advantages, conservative subtotal hysterectomy has only a limited field of application today Both in private practice and in clinical work, it is the exception rather than the rule to encounter a normal cervix in conjunction with benign pathology of the uterine corpus requiring its ablation

Admittedly controversial, the retained cervix must be mentioned because of its importance in the operative repair of procidentia following subtotal operation, should it occur, and also as a mechanical block in its prevention Phaneuf is of the opinion that the success of any type of operation for relief of procidentia depends on keeping the cervix well back, at right angles to the vagina [3] Hamilton advises that the cervical stump be supported by suturing the round and infundibulopelvic ligaments to it, so that the axis of the vagina is not brought into the same alignment with the direction of intra-abdominal pressure [1] In some clinics the ligamentous structures previously mentioned are disregarded entirely and, after the uterus has been excised, are left free in the pelvic cavity Others suture only one side leaving the other free, yet prolapse as a postoperative complication apparently has not been reported after these two latter procedures

While in the larger clinics the growing trend is definitely toward the total operation, statistics show that the majority of operators throughout the country still favor subtotal excision despite the fact that this type of operation is most often followed by prolapse as reported As an explanation of this extreme difference numerically, the fact that the total excision is technically more difficult plays an important role in determining the type of operation to be performed in a particular case In some instances the physical condition of the cervix may be the deciding factor between a total or subtotal excision, while the greater likelihood of a prolapse as a subtotal complication must certainly be given due consideration in all cases The retained cervix at times undergoes malignant degeneration, and many operators favor the total operation on the assumption that it is a prophylactic measure against this occurrence Whether or not carcinoma is more likely to develop in the retained cervical stump is open to question, but the possibility cannot be denied and, hence, must be considered from the prophylactic standpoint when selecting the type of operation to be performed

In discussing procidentia following total or subtotal uterine excision, reference must be made to the normal anatomic supports of both the uterus and vagina and their roles in the etiology Some interesting experiments to demonstrate the mechanism of uterine support and the part played by the various structures concerned were performed by Legendre and Bastien in 1858 and elaborated by Mengert in 1936 [15] In postmortem experiments with eight subjects traction was applied to each uterus by means of 1-Kg weights attached to the cervix by tenacula The paired structures attached to the uterus were then divided from above in varying sequences and the resulting uterine descent carefully measured Mengert reported the following results Section of the round, ovarian, infundibulopelvic and the upper third of the broad ligaments hardly affected the position of the uterus in the pelvis Section of the parametrial (lower two thirds of the broad ligament) and the upper two thirds of the paravaginal tissues allowed an average uterine descent of 10 5 cm The pelvic floor, although it was never incised, did not hinder experimental prolapse of the uterus and, therefore, could not have contributed to uterine support in any of the eight subjects He notes that marked descent of the uterus, amounting to actual prolapse, never occurred so long as any part of the upper two thirds of the paravaginal and/or the lower two thirds of the parametrial tissues was intact Of these two arbitrary divisions of the urogenital fascia propria, the paravaginal tissue seemed to be slightly more important, for its division allowed an average uterine descent of 6 9 cm as against 3 6 cm following division of the parametrial tissues These interesting experiments throw some light on the question of whether the vaginal supports are muscular or fascial There is no consensus of opinion on this point, but Frank attempted to clarify the situation by dividing the vaginal supports into two divisions, one a holding apparatus which he likens to the springs of a motor car, the other a supporting apparatus which he compares to the shock absorbers [16] He describes the holding apparatus as consisting of the pubocervical ligament or fascia, the cardinal ligaments, and the uterosacral ligaments The supporting apparatus consists of the levatores ani with the fascial envelope and the triangular ligament The *holding* apparatus controls the upper part of the vagina while the supporting apparatus controls the lower part Bonney also divides the supports into upper and lower *divisions* [17]

This classification of the normal anatomic supports makes it easy to understand the mechanism of prolapse, since its degree depends upon which set of supports is involved When prolapse follows subtotal abdominal hysterectomy, the upper supports are divided, since they are the only structures interfered with during this operation The fan-shaped fascia is not primarily traumatized, and, therefore, we should hardly expect any

increased incidence of prolapse as a postoperative sequel. However, as stated by Bonney, the uterus itself acts as a mechanical deterrent to prolapse, and if it is in its normal position of anteversion, the angle formed by the axis of the uterus and vagina tends to prevent descent of the pelvic tissues or structures Hamilton has presented a very plausible explanation for its being five times more frequent after the subtotal operation He states that after subtotal hysterectomy the axis of the cervical stump and vagina have a tendency to become aligned, thus favoring the occurrence of prolapse The cervical stump by holding the upper portion of the vagina open, tends to fashion this structure into a cylinder which he claims is easier to invert than the cone-shaped upper portion of the vagina which is formed following a total hysterectomy, due to the absence of the cervical stump, plus a shortening and reduction in the vaginal diameter Considering that total excision is usually done by the more experienced surgeons and in selected cases, the occurrence of prolapse would naturally be less frequent than in operations performed by men of varying skills. The cone versus cylinder theory is of value in clarifying to some degree the mechanics of procidentia following hysterectomy

Shaw, in 1934, stated that the most difficult cases of prolapse to treat are those following hysterectomy [18 19] Phaneuf, in 1935, recommended colpectomy, either partial or total, with removal of the cervical stump in cases of procidentia following total or subtotal excision which are not easily cured by the ordinary methods [8] Farrar utilizes the midportion of the cervical stump after dissecting off the mucous membrane in a modified Watkins interposition operation [20] Read and Bell and Davidson in four reported cases state that vaginal repair was done in two and ventral fixation of the stump in the remaining two [4 5] Many diverse procedures have been suggested and practiced for the relief of this condition The Manchester operation has been favored by some and good results have been reported, I personally have seen two failures following this procedure There can be no routine treatment of this postoperative complication, and what to do presents a problem which depends on the factors present in each individual case The age of the patient degree of prolapse complications previous treatment, and resumption of marital relations postoperatively must determine the type of therapy to be instituted. When an operation such as the Le Fort colpectomy is contemplated the patient should be informed of its after-effects on sex life even in cases where this situation does not have to be considered immediately

The paucity of clinical reports in the literature indicates the need for more case reports of procidentia following hysterectomy of any type as this complication does not appear until some time after operation Conscientious follow up should be the rule not the exception, of this phase of gynecologic surgery Only when this is done can we expect to obtain statistics worthy of the name which will aid us in evaluating the respective operations now performed for the relief of posthysterectomy prolapse

The foregoing brief review of uterine prolapse and its relation to hysterectomy, either total or subtotal, indicates the need for an operative procedure not too difficult technically, which will give firm support to the cervical stump and prevent subsequent recurrence Each case is a distinct entity, and all factors present in the individual patient must be considered and evaluated in selecting the type of operation suitable in the particular patient The technic of the operative procedure which has given me entire satisfaction and complete relief to the patient is carried out as follows

With the patient in the modified Trendelenberg position, a midline incision is made extending from the symphysis pubis to a suitable distance below the umbilicus, or the midline scar of a preexisting incision is excised

The fascia is exposed and incised in the line of incision The rectus muscle is separated in the midline and the peritoneum opened The intestines usually migrate from the pelvis or are manually displaced, leaving the operative field unobstructed The cervical stump is identified Allis clamps are placed on each round ligament close to the cervix, to be used for making traction to bring the cervical stump high up into the wound.

The bladder peritoneum over the stump is incised and the bladder pushed downward from the upper portion of the cervix (Fig 1)

The cervix is grasped with a single tooth tenaculum and the Allis clamps removed. An assistant applies traction to the tenaculum drawing the stump as high as possible into the abdominal wound This traction is maintained throughout the operation.

A suture of number 1 chromic catgut is introduced about 1 inch lateral to the midline and 2 inches above the level of the cervical stump through the anterior rectus sheath rectus muscle, posterior rectus sheath and peritoneum. A bite is then taken through the superior surface of the denuded cervical stump emerging on the opposite side of the abdomen through the peritoneum, posterior rectus sheath, rectus muscle and anterior rectus sheath The suture is left loose in the wound (Fig 2)

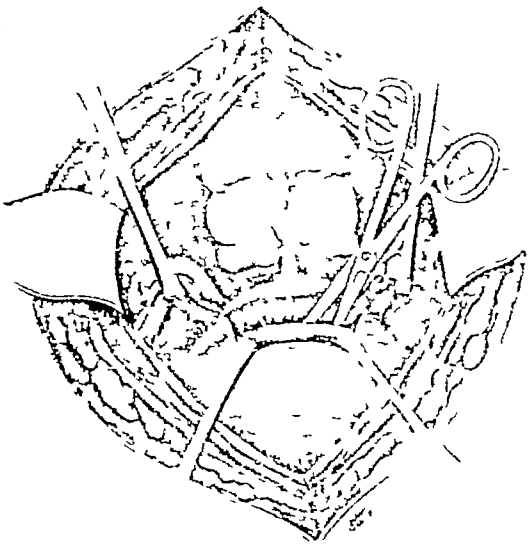

FIG 1 The peritoneum incised over the cervical stump and the bladder separated downward

The same procedure is carried out with a second suture introduced about 3/4 of an inch below the first suture

The cervical stump is held as high as possible in the abdominal wound by means of the tenaculum previously applied The peritoneum is then closed with a running suture, starting at the lower angle up to the cervical stump The s is carried around the upper or superior surf the stump, leaving a window through the toneum The balance of the peritoneum closed in the usual way (FIG 3) The fa next closed, starting at the lower angle of

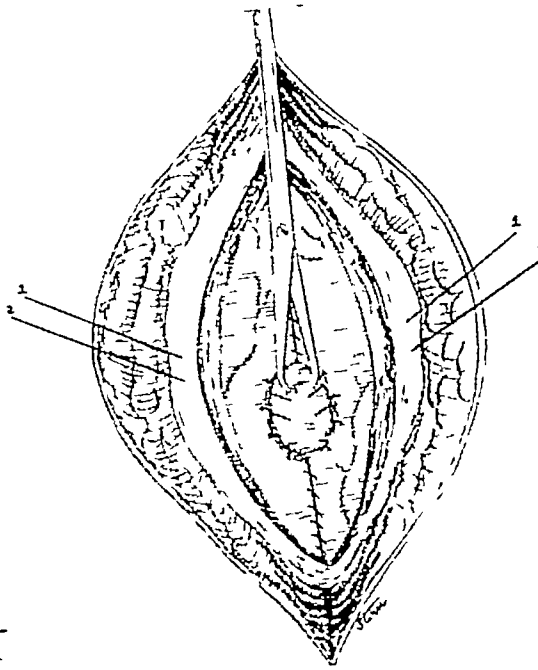

FIG 3 The peritoneum closed

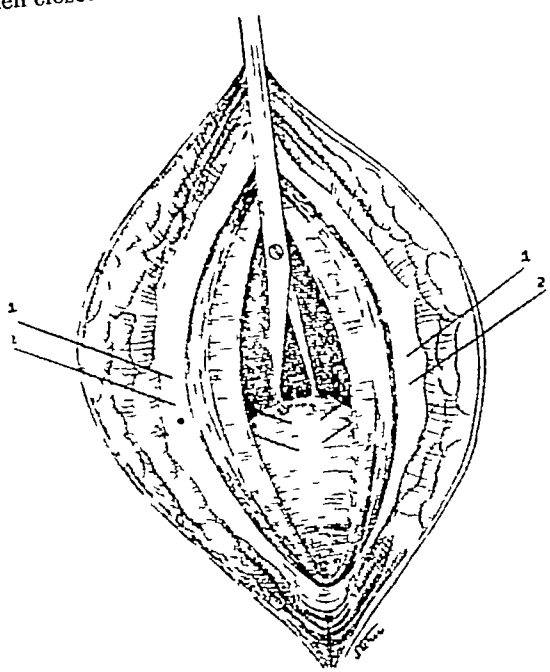

FIG 2 "Guy Sutures" (1, 1′ and 2, 2′), passing through anterior rectus sheath, rectus muscle, peritoneum on one side through the cervical stump and then out on the opposite side from the peritoneum through the anterior rectus sheath

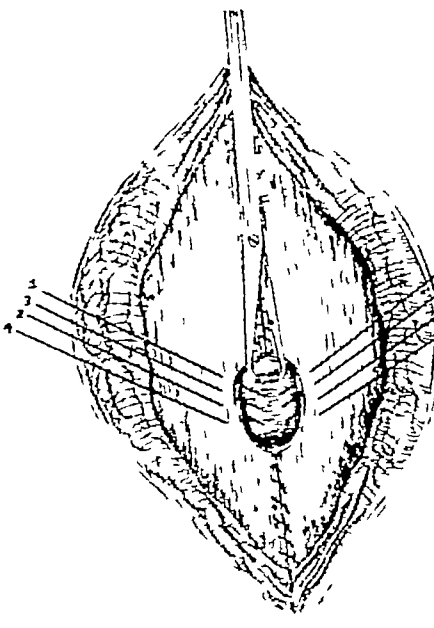

FIG 4. Interrupted sutures 3, 3′, 4 the fascia on one side through the c through the fascia on the opposite s

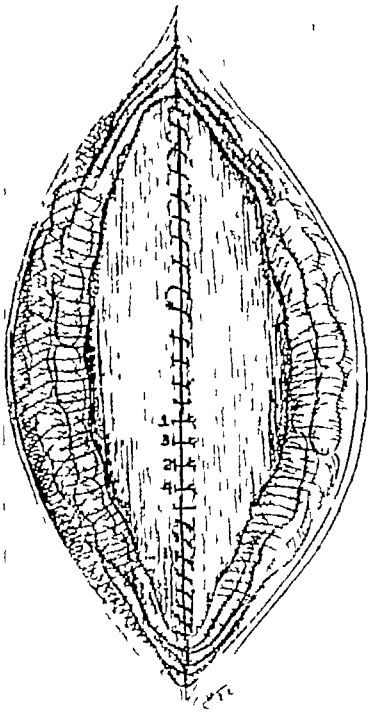

FIG. 5. "Guy Sutures," 1 and 2 tied. Fascial sutures 3 and 4 tied. The entire fascial layer closed.

cision until the window is reached. Two interrupted sutures are then introduced through the fascia on one side passing through the cervical stump and through the fascia on the opposite side and left untied (Fig. 4). The fascia is closed above the window. Still holding the cervix as high as possible, suture number one is tied, suture number two is tied (Fig. 5). The tenaculum is then removed. The two fascial sutures, numbers three and four, are tied. Skin closure follows, thus completing the operation.

If we accept the reported statistics that approximately 95 per cent of all hysterectomies performed are of the subtotal type and that prolapse is five times more frequent after this operation, the procedure which has just been described should have a definite place in the surgery of prolapse following subtotal hysterectomy. It is of little value in a postoperative prolapse where the cervical stump has not been retained. It is with the full knowledge of its limitations as well as of its proved value when performed in properly selected cases, that I offer the procedure for consideration.

Discussion

Joseph H. Cornell, M.D., *Schenectady*.—The subject of complete prolapse following hysterectomy is a very interesting one and as Dr. Hyams pointed out, very little space is given the subject in current textbooks and medical literature. I believe it is rare.

I wonder if most of the patients presenting this complication might have developed a prolapse had the subtotal hysterectomy not been performed. Too many times we see a patient in the fourth or fifth decade of life with a partial or complete prolapse of few months duration in whom no operation was ever performed whose last child was born fifteen or more years ago and who, during this interim had no reason to suspect the presence of any pelvic disorder. Dr. Hyams mentioned Kennedy's estimate that 95 per cent of all hysterectomies done in the United States are subtotal. Why is not the condition of prolapse seen in much larger proportion?

In my opinion when a subtotal hysterectomy is done either there is no gross evidence of damage to the supporting structures or it is perhaps overlooked only to have the prolapse become apparent some *time following the operation.*

The experiments performed by Legendre and Bastien in 1858 interested me very much, because these demonstrated that no descensus was noted when the upper ligaments about the uterus were divided. This is exactly what takes place in doing a subtotal hysterectomy.

By my preceding remarks I am in no way defending the subtotal hysterectomy since your discussor is presently making a statistical study of 400 consecutive hysterectomies personally performed of which 398 were total hysterectomies, and two of the subtotal type. The two cases of subtotal presented technical difficulties at the time of operation but I am happy to report that even these two retained cervices were subsequently removed by the vaginal route because of annoying vaginal discharge.

We have no laboratory or therapeutic test to demonstrate a normal cervix in situ or one that may become troublesome in later years. If a patient is destined to develop a cancer of the cervix she will, whether the body of the uterus is still attached or has been removed at operation.

Four months ago a patient on whom I had performed a subtotal hysterectomy eighteen years ago consulted me complaining of a vaginal discharge of two months duration. Visual examination of the cervix and confirmed by biopsy revealed an epidermoid carcinoma of the cervix. When I informed the patient of her condition, she replied: *Why didn't* you take it all out eighteen years ago? Never was I struck between the eyes with greater accuracy and at this point I changed the subject.

As for the management of prolapse following the subtotal hysterectomy, one is mostly concerned with the anatomy of the supporting structures which consist mainly of cervicopubic fascia, cardial ligaments, uterosacral ligaments, smooth muscles radiating out from the cervix along with the cardinal ligaments, levator ani muscles, and that portion of the endopelvic fascia extending from the cervix down the rectovaginal septum to the insertion into the perineum It is the tearing or stretching of these structures that results in the prolapse

In performing a total hysterectomy the above mentioned structures are restored to nearly normal anatomic relation, whereas in a subtotal operative procedure they are not altered

My approach of choice in a prolapse with a retained cervical stump would be to do a Manchester operation with shortening and fixation of the uterosacral and cardinal ligaments and fastening these to the strong suburethral fascia The Manchester operation, when correctly done, offers one of the best operative procedures in repairing tissue damage resulting from childbirth An alternate procedure would be through the abdominal route after displacing the bladder from the retained stump, the cervical stump is then dissected, and the vaginal canal entered This is then followed by shortening and fixation of the pericervical ligaments together with an anterior and posterior repair vaginally

I wish to compliment Dr Hyams on his success obtained with the fixation of the stump to the anterior abdominal wall and fully agree with him that each case is a distinct entity and all factors present in the individual patient must be considered in selecting the best operative procedure No other operative procedure will greater tax one's knowledge of anatomy, surgical skill, and judgment than the repair of complete prolapse following hysterectomy

ACCIDENT PREVENTION

The only good accident is the accident that never happens We may view accident prevention with the eyes of the worker who thereby escapes disablement, or of the employer whose costs are substantially reduced by accident prevention, or in our own interest because the accidents that do not happen never become workmen's compensation cases for us to administer, or because as consumers we pay an exorbitant cost for accidents that could and should have been avoided One way or another, the problem is ours

On-the-job accidents to workers in the United States in 1947 resulted in the staggering total of 2,050,000 disabling injuries and 17,000 deaths, according to figures compiled by the National Safety Council. Work time lost as the result of these disabling injuries aggregated 280,000,000 man-days, which is equivalent to 1,000,000 men kept out of work continuously for more than a full year The cost of 1947 work accidents was approximately $2,600,000,000, of which one half, or $1,300,000,000, represented immediately visible costs to workers and industry, such as wage loss, expense of medical care, and overhead cost of workmen's compensation insurance The other one half, or $1,300,000,000, was the estimated value of damaged equipment and materials, production slow-downs, and time lost by fellow workers not disabled by the accidents —*From an address by Miss Mary Donlon, Chairman, New York State Workmen's Compensation Board, at Convention of International Association of Industrial Accident Boards and Commissions, September 13, 1948*

MISUSE OF INSULIN IN THE DIABETIC SYNDROME

HERBERT SCHREIER M D , and ELMER L SEVRINGHAUS, M D , New York City

(From the Endocrine Nutritional, and Metabolic Service of Gouverneur Hospital)

THE causes of diabetes in man are unknown. Hyperglycemia is an excess of glucose in transport to tissues and organs. We may frequently incriminate the pancreas (pancreatic insufficiency as far as insulin is concerned) as the cause of hyperglycemia when the cause lies in disturbed peripheral utilization of glucose, in an overproduction of glucose, or in both Insulin, however, is useful in all types of diabetic syndromes. To be sure, insulin is the therapeutic agent to be used to prevent dehydration and acidosis in the diabetic patient if such a threat exists, regardless of the cause Insulin is truly the only antidiabetic factor available at present for therapeutic use, whereas diabetogenic factors are many After twenty-five years of the use of insulin, we are beginning to understand its action The pituitary, and possibly also other tissues inhibit hexokinase, an enzyme which is omnipresent in tissues Insulin removes that inhibition so that glucose can be phosphorylated into glucose phosphate and further metabolized, ultimately, to carbon dioxide and water

Additional factors, which retard the utilization of glucose and are, therefore, to be considered as diabetogenic may be listed as follows

1. Brain disturbances with temporary or permanent results following either trauma or psychic shock.

2 Acute infectious processes with either temporary or permanent consequences

3 Toxins or chemical products of infectious processes, allergic reactions, and ketosis

4. Hepatic disturbances such as grave deficiencies of the B vitamins and ascorbic acid or cirrhosis due to extensive deficiencies or possibly, overfeeding,

5 Excessive secretion of epinephrine by the adrenal medulla with temporary hyperglycemia or excessive secretion of certain steroids of the adrenal cortex with temporary or permanent hyperglycemia.

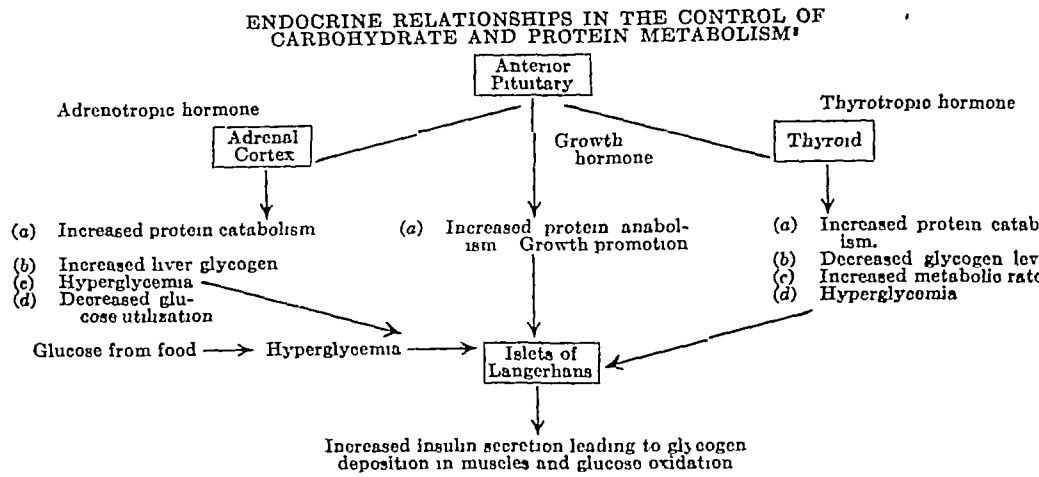
6 Disturbances during pregnancy which may be explained as associated with either the pituitary, hepatic, or adrenal mechanisms referred to above

7 Persistent hyperthyroidism

In treating patients with hyperglycemia and glycosuria, insulin use is too frequently being abused, particularly in the older age group Why should one administer insulin very cautiously in older diabetics?

1 To prevent obesity which, aside from the metabolic strain, puts a strain on the cardiovascular system

2 To prevent insulin shocks With lack of supervision, low blood sugar levels may be precipitated, causing symptoms which vary from headaches to mental disturbances. It is easily conceivable that, with protamine zinc insulin hyperglycemia and glycosuria may be changed during the course of a day insidiously but very extensively Low blood sugars may bring about mild to severe insulin reactions which go unrecognized because twenty four-hour urine specimens still show presence of sugar in the urine.



3 To prevent stenocardia and coronary insufficiency

We do not fully understand the relationship of obesity to diabetes. Biskind and Schreier suggested a mechanism by which overeating of easily available carbohydrates creates a lack of vitamins needed in the utilization of refined starches [1 2] A deficit of co-enzymes needed in the utilization of carbohydrates is created, the liver is damaged and diabetes may be precipitated in predisposed individuals C N H Long in the discussion of endocrine control in carbohydrate metabolism gave the following diagram (Fig 1)

If we are dealing with a weakened pancreatic reserve and can produce diabetes by pituitary injections, we can also produce it by continued hyperglycemia through the alimentary tract where a predisposition exists It is not within the province of clinical work to prevent pituitary hyperfunction as a diabetogenic factor, but we can prevent diabetogenesis through overfeeding in a given individual

Given an obese individual who develops diabetes, it is proposed that the individual not be given any insulin unless acetonuria coexists with the glycosuria Weight reduction is paramount in such cases Obesity is a prediabetic state in such individuals. One may well permit the optimal weight to be established by managing the diabetes in such cases with a minimal diet without insulin Out of 120 diabetics, weighing over 180 pounds each 108 (90 per cent) were treated without insulin by one of us (H S) In following a regimen of this nature one must naturally be

Presented at the Clinical Conference Gouverneur Hospital, November 20 1947

If hyperglycemia is too persistent or the stimulation of the general metabolism is too great i e rapid growth increased metabolic rate or excessive caloric intake, the insulin secretory mechanism may fail

FIG 1

on the alert for the occurrence of nutritional and vitamin deficiency

This is not intended to mean that patients now on insulin therapy should have mass withdrawal of insulin dosages by physicians who have not had sufficient experience with diabetes It is advised that one proceed cautiously, preferably by hospitalizing those cases to prevent the possibility of precipitating diabetic acidosis To be sure, there are severe cases of diabetes which would go into diabetic acidosis immediately on the withdrawal of insulin

The physician should exert caution by calling the attention of the patient to the fact that the appearance of acetone in the urine may lead to acidosis and coma When a patient develops a skin infection, the doctor need not necessarily treat the diabetes with insulin merely because of high blood levels, glycosuria, and skin infections In obese diabetics acetone in the urine is the only indication for which insulin therapy need be initiated promptly

Case Reports

Case 1 —I L , a male dwarf of forty-four years, had diabetes of eight years duration Insulin up to 80 units had been administered, and insulin shock and coma resulted The insulin was stopped for four years The patient was hospitalized during the period and was discharged without insulin

Case 2 —L K , age sixty-nine, weight 300 pounds fifteen years ago, suffered from diabetes of five years duration Insulin was administered prior to amputation of a limb and continued for six months in an attempt to control the diabetes Frequent insulin shocks were associated with profuse sweating and precordial pain Insulin was stopped, and diabetes is now controlled by diet alone

Case 3 —F P , a sixty-eight-year-old hypertensive cardiac and diabetic patient for many years, was an extremely nervous individual Because of large amounts of glucose in the urine, insulin was stepped up to 45 units per day Fasting blood sugar was 94 mg per cent Insulin was reduced to 10 units, and frequent precordial pains which occurred before have disappeared

Case 4 —O B , age fifty-two, weight 210 pounds, blood sugar 320 with sugar and acetone in the urine, was on insulin therapy for two weeks Controlled without insulin, the blood sugar level is 125

Case 5 —J G , age sixty-three, weight 185 pounds, had a history of duodenal ulcer of fifteen years duration, diabetes of one year duration He was urged by another physician to take insulin but refused He was under care for one month during which time glycosuria was ignored, since there was no acetone in the urine The man is sugar free at the present time, and diabetes is controlled with diet alone His present weight is 170 pounds

Case 6 —L M , age forty-five, weight 200 pounds, on a diet lost 40 pounds Blood sugar is 110, and there has been no glycosuria in the past year

Case 7 —A S , age seventy, weight 150 pounds, had diabetes of twelve years duration On 45 units of protamine zinc insulin and 15 units of regular insulin, frequent attacks of pain in the chest and sweating occurred Insulin is now being gradually reduced to much lower levels

Case 8 —W H , age thirty-three, weight 190 pounds, had an enlarged liver and atrophic glossitis A diagnosis of nutritional deficiency and diabetes was made Blood sugar was 350 mg per cent with 7 per cent sugar in the urine With diet and adequate amounts of vitamin therapy glycosuria disappeared completely Sugar tolerance is normal at present time by test

Case 9 —O V , age fifty-six, weight 170 pounds, was hospitalized with glycosuria and acetonuria The patient was on insulin for one week The patient was then put on an adequate diet and is now sugar free with normal sugar tolerance

Conclusions

Many factors, known and unknown, are dia-

betogenic in man Insulin is the only antidiabetic factor to be used in all cases of juvenile diabetes (true insulin deficiency) and dehydration and acidosis in the diabetic syndrome, regardless of cause Insulin is *not* to be used in obese diabetics and in other older diabetics before dietary measures have been applied and before other diabetogenic factors have been investigated

The importance of the checking of blood sugars in insulin-treated cardiac patients or in older people who are not cardiac patients needs to be stressed

The cases managed without insulin may fall into the hands of clinicians in other specialties who are too apt to ascribe complications to lack of control of diabetes Better understanding of the rationale of the regime would greatly benefit the patient The use of insulin in older, obese diabetics frequently becomes an easy substitute for education of the patient in the use of appropriate diet Consequently, as more food is taken the insulin is increased because of continued glycosuria The results include uneconomic use of insulin with possibly dangerous reactions Obesity and hyperglycemia persist despite the insulin dosage, which probably could have been minimal or done without completely

PRIZE ESSAYS

The Merrit H Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 2 1949, in Buffalo

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York.

The Merrit H Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State.

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of a prize it will not be awarded

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct"

All essays must be presented not later than February 1, 1949 and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York 292 Madison Avenue, New York 17, New York.

ARMITAGE WHITMAN, M D, *Chairman*
Committee on Prize Essays

SPINAL ANALGESIA AND ANESTHESIA IN OBSTETRICS

H ARTHUR SNELL, M D , Schenectady, New York

(*From the Department of Anesthesia, Ellis Hospital*)

THE advantages of the ideal regional anesthesia in obstetrics are well known The immediate spontaneous cry of the wide-awake baby, the physical well-being of the pain-free mother, and the minimal blood loss have all been emphasized in countless publications However, although an immediate cry is a satisfaction, adequate means of resuscitation have reduced infant mortality due to drug depression to a minimum Properly utilized oxytocic drugs will generally give adequate postpartum uterine contraction and retraction and proper use of amnesics, analgesics, and general anesthetics will in the majority of cases spare the mother the physical pain and mental anguish of parturition

The factor mainly responsible for our search for a desirable regional block was the comparatively high incidence of aspiration of stomach contents which occurred during emergence from general anesthetics Three cases were followed in as many months which showed aspiration of fluid gastric contents giving the asthmatic type of reaction in the lungs [1] These cases are of interest in view of the prolonged x-ray evidence of diffuse pulmonary involvement in spite of negative clinical signs and symptoms It would seem, when one remembers the prolonged emptying time of the stomach and the frequency of an uneven anesthetic course in the often poorly prepared patient, that this complication may, in many cases, be the unrecognized cause of postpartum morbidity

Although continuous caudal anesthesia has been widely acclaimed as the ideal anesthetic for properly selected cases, the increasing number of reports of purely anesthetic complications has been a deterring factor in setting up the technic in our locale with its minimum of trained medical anesthetists and absence of an adequate obstetric resident staff Too frequently, one reads of such complications as infections at the site of injection, rare cases of arachnoiditis, prolonged periods of urinary retention, transitory periods of paralysis, paresis, or areas of anesthesia, and, although few, still too many maternal deaths from anesthetic causes, or possible instances of fetal mortality due to toxicity of large concentrations of the local anesthetic drug [2 3]

Parmley and Adriani's article on low spinal or "saddle" block anesthesia using nupercaine in obstetrics indicated a method with all the advantages of continuous caudal block and few of its major disadvantages The drug was long acting, giving up to three hours of complete pain relief, there was no chance of contamination and subsequent infection at the site of needle puncture, neurologic complications with such small concentrations of the drug are almost impossible, and there can be no drug reaction [4] With careful attention to technic of administration, the mother's life should be beyond danger, in the presence of a skilled obstetrician the baby's life is subjected to a minimum of risk

Neuroanatomy

The afferent nerve supply of the uterus was shown by Cleland in 1933 to consist of two components—the pain of uterine contractions through the eleventh and twelfth thoracic dorsal roots, and that of stretching the birth canal through the sacral nerves, possibly sacral two, three, and four [5] This was confirmed in 1945 by Frankel, who showed that anesthesia to the eleventh thoracic segment caused either no change or improvement in strength of contractions, from the sixth to the tenth thoracic segments some slight diminution of the strength of contractions, and interruption of labor to be the rule with anesthesia to thoracic four and above [6]

In this paper our first 100 cases of spinal anesthesia, in which we used nupercaine in obstetrics, are reported It was found that for complete relief of pain the anesthesia should extend to the tenth thoracic segment For the early cases the technic of Parmley and Adriani was followed, but since too many patients experienced incomplete relief of pain, in some cases requiring nitrous oxide for the application of forceps or at the time of delivery, the technic was altered somewhat to give slightly higher anesthesia and more consistently good results

Technic

During early first stage the patients were given demerol or demerol and seconal to control extreme discomfort The indication for starting the spinal was the presence of an engaged head with three or four fingers dilatation in multipara and full dilatation in primipara As others have pointed out, it was noted that if the anesthetic was given before the head was engaged and dilata-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Obstetrics and Gynecology May 20 1948

tion well advanced, the progress of labor was arrested and advancement would only recur after the spinal had worn off " " If possible, the spinal was administered in the delivery room but some were given while the patient remained in the labor room

One-half cubic centimeter of 1 200 nupercaine was mixed in a 5-cc. syringe with 1/2 cc. of 10 per cent dextrose. The patient was placed in the sitting position with the legs over the side of the table, the back arched, and the arms around the shoulders of an assistant. After preparing the back with zephiran, a skin wheal was raised over the second lumbar interspace using 1 per cent procaine. The tap was done at this level, the syringe attached and 1/2 cc of spinal fluid aspirated and mixed with the prepared solution. The solution was then injected as rapidly as gentle pressure on the plunger would allow The patient remained in the sitting position for fifteen seconds after the start of the injection and then returned to the supine position—flat with head on a pillow Care was taken not to inject at the time of a contraction, since cerebrospinal fluid pressure is raised at that time, causing a wide diffusion of the drug.

The patient generally noticed the next pain to be diminished in intensity and had no sensation with subsequent contractions. There was complete perineal anesthesia, with anesthesia or hypesthesia extending over the legs and the abdomen to the level of the tenth thoracic segment. If the hypesthesia did not reach almost to the level of the umbilicus, the patient felt some discomfort with the contractions There was some motor weakness of the legs, but the abdominal muscles retained their normal contractile strength. The ability to "bear down" was thus retained, provided the patient was given proper instruction. All the anesthetics in this series were given by one of three members of the anesthetic department and were either watched constantly by them or by a nurse anesthetist

Results

Pain Relief.—There was complete pain relief in 89 per cent. Two cases in this group were given supplemental nitrous oxide because they had been poorly selected from the psychologic standpoint. They became very restless, apprehensive, and uncooperative These cases demonstrate the importance of evaluating the patients' ability to cooperate and receive benefit from regional procedures. This should be done during their prenatal visits, long before admission to the hospital. One case of face presentation was given deep ether to obtain sufficient uterine relaxation for version and extraction.

Pain relief was incomplete, but no supplemental anesthesia was needed in 3 per cent. These patients experienced some pain or pressure during the application of forceps or delivery

Pain relief was incomplete with supplemental anesthesia needed in 9 per cent. Five cases had nitrous oxide for short periods (from two to five minutes), generally at the time of delivery The most frequent complaint was pain in the region of the ischial tuberosities This occurred in the early cases when the site of injection was lumbar three or four, rather than at lumbar two In one case the anesthetic was definitely inadequate, probably because of partial displacement of the needle during injection In two cases the anesthetic was given before cervical dilatation had started, labor failed to progress, in spite of continuing contractions, until the spinal had worn off Both patients were delivered hours later under general anesthesia.

The duration of the procedure from the time the spinal was given until completion of episiotomy repair ranged from ten minutes to five hours. The average duration was fifty five minutes. The longest effective duration of a single dose was three hours Three patients received two spinals each.

The Course of Labor.—In those patients who received their anesthetic prior to full dilatation, the remainder of first stage seemed to be definitely shortened The observation of others that second stage was considerably prolonged could not be made on this series because of the high incidence of low forceps (Table 1) However, it was noted that, in spite of the retention of full expulsive force of the recti muscles and the continuance of contractions of the same frequency and duration as before anesthesia, in many instances the descent of the head did not progress as rapidly as in the case of the unanesthetized counterpart. It should be mentioned that, if labor is to progress satisfactorily, each patient must be watched constantly and coached as to the time of contractions. This is a distinct disadvantage to the technic at a time when nursing personnel are few and their duties heavy

TABLE 1.—TECHNIC OF DELIVERY

Spontaneous	15
Low forceps	58
High midforceps	2
Persistent OT or OP requiring rotation	21
Breech	2
Face presentation with version and extraction under deep ether	1

Persistent occipitoposterior and transverse position also occurred with greater frequency This was doubtless due to the complete relaxation of the pelvic floor with consequent loss of the firm base on which the head turns prior to delivery However this same extreme relaxation facili-

tates greatly the necessary manual or instrumental rotations and the application of forceps for delivery

The two breech presentations noted were delivered spontaneously without difficulty

Of special note are two patients with mitral stenosis and low cardiac reserve Both cases had been confined to bed for periods of two and three months prior to delivery Both had had one previous pregnancy and delivery with a period of acute cardiac decompensation postpartum At the time of delivery both had basilar rales Spinal anesthesia was given at four fingers dilatation with the head engaged When fully dilated, the patients were asked to bear down with the contractions and exhibited marked increase in pulse rate with each effort High midforceps were applied with ease, and the babies were delivered without difficulty The blood pressure remained stable The cardiac status improved following delivery One mother exhibited a mild psychosis for three days postpartum with complete recovery Six and eight months later both mothers and babies were well

The blood loss, as expected, was minimal, averaging 255 cc per case as compared with 355 cc per case in an equivalent number of cases under general anesthesia

Condition of the Baby —Ninety-one babies cried immediately and spontaneously One was slow to cry Five babies required brief periods of oxygen and resuscitation Of the two cases in which the spinal was given prior to the beginning of dilatation and who were delivered hours later under ether anesthesia, one was apneic and, in spite of intubation and resuscitation, spontaneous respirations could not be initiated Postmortem showed bilateral atelectasis

There was one stillborn, in which case no fetal heart could be heard prior to the induction of the anesthetic

Three of the babies died within the first 72 hours One had a tracheo-esophogeal fistula and one was a six and one-half months premature The third case was a difficult forceps delivery as a persistent posterior Repeated attempts to rotate the head failed due to a narrow midpelvis The baby cried immediately but soon showed paralysis of the right face and left arm and bilateral spastic legs At postmortem a fractured skull and intracranial hemorrhage were noted

Complications

Headaches were the most frequent and most troublesome complication early in the series and, in some cases, were of such severity that at one time the abandonment of the technic was considered However, following the suggestion of Weintraub, who bases the occurrence of postspinal headaches in the obstetric patient on orthostatic hypotension, a tight abdominal binder was applied to each patient when she left the delivery room and was left in place during her hospital stay [8] Since then, although headaches are still frequent, the intensity has not been severe or prolonged, and they have been controlled by small doses of aspirin

Incidence of headaches believed to be due to anesthesia was approximately 30 per cent A follow-up of 50 cases over periods of from three to six months postpartum showed that 19 patients (38 per cent) had had headaches, 43 patients (86 per cent) would desire another spinal should they have another delivery, and seven patients (14 per cent), most of whom had had incomplete pain relief, said that they would not have a repeat spinal

There was only one complaint of backache

Nausea and vomiting were rare, occurring in only five cases

In the majority of cases there was a minimal drop in blood pressure of 10 to 15 mm Hg, symptomless, requiring no treatment and probably due to alleviation of pain For the first 15 cases, methedrine was used as a prespinal vasopressor Four of these cases exhibited a sharp rise in blood pressure, two of which experienced transitory, severe headache Since the deletion of all pressor drugs from the technic, this has not recurred

There were four cases with acute drops in pressure to levels below 80 mm Hg systolic These immediately responded to small intramuscular injections of neosynephrine and were symptomless One pre-eclamptic showed a drop from 160/100 to 120/80 and stabilized at that level Urinary retention occurred with no greater frequency than with other methods of delivery Neurologic complications were absent Pulmonary complications were absent There were no maternal deaths

Summary

A series of 100 deliveries using spinal anesthesia with nupercaine, 1 200 plus 10 per cent dextrose for late first stage and second stage labor, is reviewed An estimation of the results may be grouped as follows

1 Excellent, 83 per cent In this group the anesthesia and obstetric course were completely satisfactory

2 Good, 11 per cent Of these, two cases had marked rise in blood pressure with headache during delivery The remaining nine patients had some minor complaints, some requiring nitrous oxide for short periods

3 Poor, 6 per cent One had inadequate relaxation for version and breech extraction Two cases were uncooperative and psychically poorly

chosen In two patients the spinal anesthesia was given too early, and labor was temporarily stopped One spinal was definitely inadequate

As the technic has been altered from time to time to meet our needs during the early cases, it is felt that the number of excellent results would be much higher with a later group of cases

Conclusion

The frequency of aspiration pneumonia after general anesthesia in the often poorly prepared obstetric patient is a definite indication for the use of regional technics.

Spinal anesthesia, with its simple technic, would seem to have all the advantages of continuous caudal anesthesia without many of its disadvantages. Three things are of major importance for its safe and successful use a patient psychically suited to regional procedure, a carefully standardized technic to obtain consistently good results, and a well-trained obstetrician, so that the increased number of complicated instrumental deliveries will be safely managed

Discussion

E. G Waters, M.D., *Jersey City New Jersey* — Our common use of spinal has been as a terminal anesthetic, with labor termination preordained. We have never used it as an analgesic for second stage of labor although we have been miscredited with so doing Our *hopes are certainly in concert* with all who look for the consummate agent for block analgesia and anesthesia.

The effect sought by Dr Snell is more prolonged and more complete pain relief, and, therefore he wisely and properly does not attempt a saddle block, but rather anesthesia to the tenth dorsal segment. My own experience with nupercaine in dextrose is limited but suggests so far that a much less toxic form of drug must be sought which will give long relief without headaches

I do not believe Dr Snell s cases were broken down for patient parity which is extremely important in considering labor duration and type of termination In addition I question the explanation given for arrested occiput transverse and posterior positions in this as well as caudal anesthesia In this present series, the average duration from induction of the spinal anesthesia to the episiotomy repair averaged fifty five minutes, with ranges from ten minutes to five hours. The longest single dose lasted three hours, and only three patients had more than one injection. Certainly fifty-five minutes, or three hours for that matter, cannot be considered too long as a second stage and I would seriously question the need for 21 rotations, two midforceps and 58 low forceps in a group of 100 deliveries when the total elapsed anesthetic time was so short. But again, I would insert my own belief that low forceps control and episiotomy under good anesthesia is the best way to deliver most primipara and many multipara. In the present discussion I suggest that the human tendency—and I certainly stand as no exception—is to shorten the 'waiting time when such a method as this one is used

I wish to be understood as being in full accord with attempts to provide, through regional and local anesthesia, progressively better, longer safer and more effective pain relief to women during labor and parturition Not infrequently, however methods are proposed which cannot reasonably be expected to give the relief for which they are designed Obviously, the anesthetic agent in block and local anesthesia must come into contact with the upper neurones or the peripheral nerve fibers supplying the area of hoped-for anesthesia in order to be effective During labor, it is also important not to block the motor sympathetic fibers to the body of the uterus and thereby totally arrest labor Since the visceral efferent pain fibers of the uterus pass by way of the presacral plexus to the cord at the eleventh and twelfth dorsal segments, while the motor sympathetics leave the fourth to sixth dorsal through the vascular nerve mesh of the aortic, hypogastric, and uterine vessels it is clear that pain relief may be achieved without loss of motor effectiveness If the anesthetic agent reaches the tenth or eleventh but stays below the seventh segment.

It is also clear that a true saddle" block will relieve pain originating in the cervix, vagina, and perineum, through effect upon the nerves of the lumbosacral trunk and the parasympathetics. However it cannot hope to relieve the pains associated with uterine contractions, and since first stage pains are due to uterine contractions, while second stage pains consist of these plus the pains of cervical, vaginal *and perineal distention and stretching, it is entirely* unreasonable to expect from a low and fixed spinal anesthetic agent, complete second stage relief

We have been using spinal anesthesia in obstetrics since 1920 and have tried nearly all the drugs and combinations, good and bad With 30 to 50 mg of novocaine properly placed in the spinal canal, complete pain relief for delivery is obtained, lasting from thirty to ninety minutes. The minutes become very long when watching a grudgingly distending perineum, and especially so if the combination of pain relief drug analgesia, and abdominal relaxation have all but obtunded patient effort

Dr Snell s interpretation of his results is fair and the claims are not exaggerated It is this type of critical analysis and honest appraisal that aids most in determining a procedure s ultimate worth

William J Gleason, M.D *Jersey City New Jersey* —Our experience with spinal analgesia and anesthesia in obstetrics dates back to the late 1920 s, when Dr S A. Cosgrove pioneered in its use and reported his findings and observations in several articles Since that time, spinal anesthesia has always been in favor in our clinics, as attested to in the literature. We believe that ours is the most extensive obstetric use of spinal anesthesia of any clinic in this country We are happy to hear that many others are now adopting it.

We have always said that spinal anesthesia had no place in the first stage of labor but had definite usefulness as an anesthetic method where labor was to be operatively terminated and in many

cases, it is the anesthetic of choice Our chief reason for such teaching was the high incidence of forceps deliveries, necessitated by its use with the particular technic we were using Like Dr Snell, we have been intrigued by the work of Parmley and Adriani with heavy nupercaine The drug is not new, the technic is. Nupercaine was used by us in 1929 in a different form, but its use was discontinued because of severe persistent headaches I might parenthetically remark that the headaches with heavy nupercaine still seem more persistent and severe than with some other drugs, particularly pontocaine and glucose Effecting true "saddle" block seems easier with it, however, than with other combinations, and motor paresis and paralysis of the legs does not seem so bothersome to the patients

We use "saddle" block for many type operations, and, at present, we are running a series of cases in obstetrics with this new technic to see if it modifies our old concepts When we have 500 cases, we expect to report our experiences on its use As yet, we still feel that it is not wise to use spinal analgesia unless labor is to be operatively terminated

I personally believe that it is superior to caudal analgesia because of its simplicity, along with the other reasons Dr Snell has mentioned It may eventually replace caudal analgesia in many clinics We are not prepared at present definitely to pigeonhole it Our results parallel those of Dr Snell and his coworkers It is only a method for use when skilled obstetricians are handling cases This should not handicap its use but augment it There is some risk and a price to pay for all analgesic and anesthetic methods As Dr Snell has pointed out, the babies are in no way jeopardized In fact, large series of cases may show that with this technic fetal morbidity and mortality may be less than in cases that have no anesthesia, the reason being that tumultous labors in multipara are slowed down to the proverbial walk, allowing patient, baby, obstetrician, anesthetist, and, particularly, the nursing staff, literally and figuratively to catch their breath This is often of great value on a busy labor floor It is useful in long-labor primipara, where one wishes to give the mother temporary respite I am sure its use will be extended to some of the medically and obstetrically complicated cases with great success

With regard to technic, we now use only 5-mg dosage, but still use the hypo syringe rather than the 5 cc advocated by Dr Snell We found that with 2 5 mg many of our cases did not get relief from uterine contraction pain, despite perineal anesthesia, which lasted in some cases six or seven hours We feel, with many others, that it may shorten the first stage of labor but prolongs second stage, necessitating the use of forceps, as with spinals, if used for analgesia alone

Returning to the subject of headache, our highest incidence was 17 per cent Dr Snell's figure of 30 per cent seems quite high It certainly is one great obstacle in the use of subarachnoid drugs The other is the high incidence of necessary forceps deliveries Even this may be considered good obstetrics by some schools Even when not used with this particular technic, spinal anesthesia is an ideal method for forceps extractions, particularly in respect to baby salvage

Dr Snell stated that his prime object in the use of spinal anesthesia was to eliminate the possibility of aspiration, pneumonitis, and bronchiolar spasm While such ideals are commendable because of the gravity of this condition, which we also have experienced many times, nevertheless, a number of cases will be admitted and delivered where the time factor will not permit the use of spinal These cases will, for some time, be an ever-present potential danger Vomiting and aspiration with resultant pulmonary complications have a high incidence in obstetrics, due to precipitous-like labors in multiparous women who have eaten shortly before their onset It takes but little gastric juice to cause severe reflex spasm in the bronchial tree

I can only agree with most of Dr Snell's conclusions We all hope for the day when the parturient will have one dependable safe method of analgesia and anesthesia instead of the variegated patchwork in use today Up to the present, we are intrigued but not convinced that this method settles many of our difficult problems

HIGH-FAT DIETS DECLARED BAD FOR HEART PATIENTS

Warning against a high-fat diet for patients with heart disease was sounded by Dr Milton Plotz, of Brooklyn, at the meeting in Chicago of the American Medical Association Deaths of 10 heart patients within seven months after being put on a high-fat diet, and much worse heart symptoms in 12 of another group of 17 within three months after being put on a high-fat diet, were cited by Dr Plotz The high-fat diets had been given most of the patients as part of standard treatment for stomach ulcers One of them was given the diet to "build him up" •Ulcer patients who have heart disease, Dr Plotz warned, should be given frequent feedings low in fat —*Science News Letter, July 10, 1948*

HABITUAL ABORTION

CARL T JAVERT, M D , New York City

(From the Department of Obstetrics and Gynecology Cornell University Medical College and the Woman's Clinic of the New York Hospital)

HABITUAL abortion is an obstetric term used to classify patients having recurrent spontaneous abortion. There is no general agreement as to how many are actually required The *arbitrary number three has been used to desig* nate such a patient in this article Further division of these patients into two groups as follows has been found to be advantageous

Group I. Primary Habitual Abortion —These patients are essentially primiparas who have had three or more consecutive spontaneous abortions beginning with the first pregnancy

Group II. Secondary Habitual Abortion.—Such patients are multiparas who have sustained three consecutive spontaneous abortions after delivery of one or more immature, premature or full-term infants.

An abortion is defined as the termination of pregnancy at twenty two weeks or less resulting in a fetus weighing 500 Gm or less. A complete classification of terms is provided in Table 1

TABLE 1.—CLASSIFICATION OF INFANTS ACCORDING TO WEIGHT AND DURATION OF PREGNANCY AT THE TIME OF DELIVERY

Classification	Birth Weight (Grams)	Duration of Pregnancy (Weeks)
Abortus	0 to 500	0 to 22
Immature	501 to 1 500	22 to 30
Premature	1,501 to 2 500	30 to 36
Full-term	2,501 and over	36 to 40

Incidence

During a fifteen year period (1933 to 1947) 56,803 pregnancies were cared for at the Woman's Clinic. One hundred eighty nine were classified as having primary habitual abortion, an incidence of 1 in 300, and 115 were considered as having secondary habitual abortion, an incidence of 1 in 493

The primary group consisted of 123 patients who had a total of 669 pregnancies, while the secondary group of 88 patients had a total of 679 pregnancies, giving a total of 1,348 pregnancies for statistical evaluation The obstetric performance before and after classification irrespective of any treatment can be seen at once in Table 2 The uncorrected abortion rate was 76 and 57 per cent for the primary and secondary habitual abortion patients respectively This is a remarkable incidence when one considers that the abortion rate for the entire clinic population is only in the neighborhood of 10 per cent.

Clinical Investigation

Each patient had a careful history, physical examination, and laboratory study Only the pertinent findings will be mentioned The average age in both groups was thirty-one years, which is eight years older than the average clinic age. Twenty-five per cent were elderly primiparas, that is over thirty five years of age. There was no significant racial distribution.

Obstetric complications occurred more frequently in both groups of patients than in the control clinic population. Nausea and vomiting were found in 87 and 60 per cent, respectively Toxemia of pregnancy, threatened abortion, and placenta previa also had higher incidences in the primary and secondary abortion patients.

Gynecologic complications, such as retroversion, were frequently observed, while myomauteri, double uteri, and cervical and endometrial polypi had a higher incidence. Detection and correction of gynecologic pathology forms an important part of the treatment.

From the laboratory standpoint the Wassermann was positive in 6 per cent and 7 per cent of the patients in the primary and secondary groups, respectively Anemia (hemoglobin below 70 per cent) was detected in 15 per cent and 17 per cent in each group, which is about double the clinic incidence. The Rh factor showed no significant variation from the expected percentages The basal metabolic rate was low in 65 per cent and 50 per cent of the patients in each group Vitamin C and prothrombin determinations were sometimes low, and other patients had normal values Vitamin E and progesterone studies were not performed.

Treatment

It was necessary to divide the treatment into three types, the results are provided in Table 3 A description of the various types of treatment follows

Type I Therapy —There were 189 pregnancies in the primary habitual abortion patients and 101 in the secondary group For practical purposes, they received no treatment since they had aborted, were threatening to abort, or did so soon

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Obstetrics and Gynecology May 10 1948.

TABLE 2 —Obstetrical Performance Before and After Classification Regardless of Therapy

	Abortion Number	Abortion Per Cent	Immature Number	Immature Per Cent	Premature Number	Premature Per Cent	Full-Term Number	Full-Term Per Cent	Total
Primary abortion									
Before	369	100	0		0		0		369
After	142	47 3	14		9		135	45 0	300
Total (Uncorrected) Performance	511	76 5	14	2 1	9	1 3	135	20 1	669
Secondary abortion									
Before	295	62 3	0		9		169	35 7	473
After	95	46 1	3		8		100	48 5	206
Total (Uncorrected) Performance	390	57 4	3	0 5	17	2 5	269	39 6	679

after placing themselves under a physician's care This is the control group

Type II Therapy —There were 50 primary and 41 secondary abortion pregnancies to be considered They were treated with bed rest, sedation, vitamin E, progesterone, and occasionally arsenicals on a specific or even empiric basis This represents the former type of therapy

Type III Therapy —There were 41 primary and seven secondary abortion pregnancies who received this treatment, also known as the current therapy It is based on a rational approach having detection and correction of all factors, defects, and deficiencies as objectives It consisted of nutritional guidance, dietary supplements with vitamins C, K and minerals, thyroid extract when the basal metabolic rate was low, and psychotherapy These patients were not confined to bed, sedation was not employed, but coitus was restricted throughout the entire pregnancy Some patients received vitamin E and progesterone, but these items are no longer a part of the present therapy

The obstetric outcome following the three types of treatment outlined above can be obtained from Table 3 The reduction of the abortion rate from 65 per cent in the control group to 14 per cent in patients receiving Type III treatment is most impressive, since it also indicates a corresponding increase in the full term infant salvage from 26 to 80 per cent in the primary group With this regimen, 100 per cent of the secondary abortion patients went to term

Obstetric Delivery and Vital Statistics

Spontaneous vaginal delivery occurred in most of the patients although cesarean section was resorted to more frequently in the primary group of patients Normal delivery occurred in 68 per cent of the primary group and in 88 per cent of the secondary group

Congenital anomalies were present in only four infants, which is less than the clinic incidence Therefore, there is no need to advise these patients not to attempt further pregnancies

Three maternal deaths occurred following operative delivery The infantile mortality was the same as the clinic incidence in the primary group (3 per cent), but it was considerably higher, namely, 12 per cent, in the secondary group While this group has a better prognosis as to full term delivery as shown in Table 2, this advantage is partially offset by the higher infantile mortality The secondary habitual abortion patients require the same skill and care in their management as the primary group

Comment

There is no general unanimity regarding the definition of habitual abortion, nor is there any agreement as to the type of treatment Therefore, a voluminous literature on the subject has been passed by Most investigators advocate this and that form of treatment, and nearly all of them yield favorable results The large number of different regimens indicates that none are entirely satisfactory Yet, they are indicative of an

TABLE 3 —Obstetric Outcome Following Various Types of Treatment Compared with Control

important situation namely, that multiple factors defects, and deficiencies must be considered This study has revealed multiple conditions in both the primary and secondary habitual abortion patients It has also disclosed that detection and correction of these conditions implies the use of many agents and methods in the same patient as a rational form of treatment Unfortunately, it cannot be stated from this study which vitamin, hormone, mineral, or method was responsible for the satisfactory outcome. However, some progress has been made in that direction by eliminating progesterone in 20 patients, 19 of whom had a premature or full term delivery Likewise vitamin E has been withheld in 13 patients, 11 of whom went to term Thus far, vitamin K has been omitted from the treatment of 11 patients, and ten went to term. However, sufficient time has not elapsed to form a definite opinion

Many of these patients were psychologically disturbed Perhaps medication served as a placebo, even though it also corrected a specific deficiency For the present, the pathogenesis of habitual abortion must be regarded as unsolved However, the anti hemorrhagic vitamins C and perhaps K may play an important role Deficiency in these vitamins may precipitate decidual bleeding leading to premature separation of the placenta (threatened abortion) which has a high incidence in habitual abortion patients Other evidence of hemorrhagic diathesis is manifested by nasal gingival, anal and dermal bleeding and was observed frequently in these patients

Summary

Primary habitual abortion designates the obstetric problem of patients who have had three or more consecutive spontaneous abortions in the first three pregnancies Secondary habitual abortion indicates those patients who have had three or more consecutive abortions after one or more immature premature or full term infants. An abortion is defined as the termination of pregnancy at twenty two weeks or less with the fetus weighing 500 Gm or less

The incidence of primary habitual abortion is 1 in 300 and 1 in 493 for the secondary type There were 123 patients in the primary group who had 669 pregnancies, and 88 secondary abortion patients who had 679 pregnancies, a total of 1 348 for statistical analysis

Present rational treatment aims at the detection and correction of all factors, defects and deficiencies found in a given patient. Such a program reduced the abortion rate from 65 to 14 per cent with a corresponding increase in the full term salvage from 28 to 80 per cent in patients with primary habitual abortion Similar results were obtained in the secondary group of patients

Current treatment consists of nutritional instructions, dietary supplements including vitamins C and K and minerals psychotherapy, prohibition of mineral oil, use of thyroid extract when the basal metabolic rate is low, interdiction of intercourse during the entire pregnancy, and removal of all gynecologic defects Sometimes treatment was begun before conception Elimination of vitamin E and K and progesterone has produced no noticeable reduction in full term salvage Gradual elimination of various agents, methods, and forms of treatment may provide a clue as to the pathogenesis of habitual abortion

Discussion

E C. Hughes, M D, *Syracuse*—Although we have not divided these patients into the primary and secondary groups, it is our opinion that a patient must have had at least three spontaneous abortions to be placed in such a category In any event, these unfortunate individuals present a definite clinical entity and deserve careful study in order to guarantee them a family They also give us a splendid opportunity to investigate the many and varied opinions expressed as to causes

There is no question but that obstetric complications, as stated by Dr Javert, are more prone to occur There seems to be a special triad of developments that occur sterility abortion, and premature labor or malformation with a higher incidence of toxemia and placenta previa thrown in for good measure Dr Javert s statement that the detection and correction of all gynecologic pathology forms an important part in the treatment cannot be underestimated However there is still a group that, although all gynecologic pathology has been corrected, are not able to carry a fetus to viability or term I have been particularly interested in this group

I think that Dr Javert is to be congratulated upon the excellent results, particularly in the Type III group An increase in the full-term infant salvage to 80 per cent in the primary group and 100 per cent in the secondary group seems outstanding It must be noted, however that there were only seven cases in the latter group. I do not understand to what group the four congenital anomalies, the three maternal deaths, and 12 per cent infant mortality are related as recorded in the vital statistics.

In attempting to analyze these excellent results several thoughts come to mind After correcting all gynecologic abnormalities, the treatment consists of nutritional guidance, dietary supplement with vitamins C and K and minerals, psychotherapy and restriction of coitus. Later in the paper he states that the elimination of progesterone, vitamin E, and vitamin K have offered almost as good results. This limits the treatment to the use of vitamin C almost entirely Could this therapy have an effect upon the germ cells and maternal organism whose defects obviously are the main causes of such a condition? Hertig states that in 50 per cent or more of these cases, there exists some abnormality in

the sperm Others have postulated that the maternal environment, particularly the endometrium, is deficient in the nutrients used as food by the growing blastocyst

It has been my feeling that the endometrium is at fault in the greater percentage of these women To further strengthen Dr Javert's opinion that all factors, defects, and deficiencies should be corrected, I would like to add to his discussion some observations which we have made

We have demonstrated that certain nutritional materials are deficient or absent in the endometrium of these persons Although the endometrium is probably lacking in many substances, we have found that it is particularly low in glycogen and an enzyme which splits glycogen In the normal patient, the metabolism of glycogen seems to follow a certain pattern It is metabolized by dehydration from glucose during the follicular phase in the cells of the glandular epithelium. The epithelial cells under progesterone influence release the glycogen onto the endometrial surface where it is hydrolyzed by enzymolic action to a reducing sugar The enzyme in the normal individual increases in amount during the progesterone period

This sequence of events does not take place in the patients giving a history of recurrent abortion and sterility The average enzyme output averaged 15 5 mg per Gm of endometrium in a group of aborters, and the glycogen itself was either deficient in amount or lacking entirely Patients that have presented this endometrial picture after several abortions have occurred and who, at a later date, conceived and then aborted, have demonstrated that the growth of the trophoblast itself is very abnormal This is demonstrated by pathologic study of these abortuses In most cases, the embryo itself is not formed or is malformed

The chorionic villi in most cases are hydropic or degenerated, and there is hemorrhage into the decidua These pathologic defects are reflected in the levels of chorion gonadotropin in these patients The material supposedly secreted by the Langhan's cell of the villi is not produced in adequate quantities because of failure of these cells to develop This lack of chorion gonadotropin results in the failure of the endometrium to produce materials for ovular nourishment When this occurs, as it does in most cases of habitual aborters, it is essential to prepare these patients, after adequate study, before pregnancy by giving them something which will stimulate the endometrium to secrete these essential materials

Perhaps vitamin C, as used by Dr Javert, may play a role in this stimulation We have used small amounts of estrogen, $^1/_{10}$ mg $\times$ 12, followed by large doses of progesterone one or two months before conception is allowed

---

SCIENTIFIC EXHIBITS
1949
ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to the Chairman of the Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss
505 State Tower Building
Syracuse 2, New York

The Annual Meeting will be held May 2 to 6, 1949, at the Hotel Statler in Buffalo

No applications can be considered after January 1, 1949

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P Anderton, M.D , *Secretary*

TOPICAL ANESTHESIA

FRANK C. COMBES, M.D., New York City, and ROSE B SAPERSTEIN, Los Angeles, California

(From the Department of Dermatology and Syphilology New York University College of Medicine and the Dermatological Service of the Third (New York University) Medical Division Bellevue Hospital)

MUCH has been written of local anesthetics administered percutaneously, but little work has been done on topical anesthetics in relation to their action on the broken and intact skin for the relief of pain and pruritus [1-6] It is the latter type of preparation which is the subject of this paper *

Most surface anesthetics are employed to combat pruritus but are rarely used for the relief of cutaneous pain as experienced in ulcers fissures burns, abrasions, excoriations etc The chemicals usually employed include the phenolic and alcoholic esters, namely, menthol, thymol, phenol, benzyl alcohol, and salicyl alcohol (salgenin) [7]

In 1890, Ritsert first employed the alkyl p-aminobenzoates as topical anesthetics using the ethyl ester which was marketed as "anesthesin" and "parathesin" and is now known as "benzocaine." [8] This is the prototype of the more recently synthesized anesthetics derived from the esters of p-aminobenzoic acid which have almost completely supplanted cocaine. In 1897, Einhorn and Heinz introduced "orthoform" (later called "orthocaine"), the methyl ester of p-aminobenzoic acid [9] This compound enjoyed only a brief period of popularity since disagreeable side-effects were many and occasionally severe. Today it appears officially only in the British Pharmacopoeia. It was originally thought that orthoform was actively antiseptic, but this is probably due to its decomposition by ulcerated surfaces with release of basic salts of benzoic acid Noorden in 1902, proved that anesthesin was superior to orthoform and relatively free of any serious side-effects [6]

In general, the alkyl esters of p-aminobenzoic acid are insoluble in water, which fact limits their field of usefulness in some respects However, they are freely soluble in alcohol chloroform, ether, and up to 3 per cent soluble in vegetable fats. They are incompatible with acids and acid salts.

Alkyl aminobenzoates are valuable ingredients of dusting powders. Ten to twenty per cent is especially useful in burns, ulcers, toxic bullous dermatoses, and pemphigus Emulsions (2 to 10 per cent) have been prepared by suspending ethyl aminobenzoate in water by means of resins mastic, or acacia.[3] Not infrequently these emulsions are highly effective as surface anesthetics Because of their solubility in fats, the alkyl esters lend themselves best to use in ointments and cerates [10] The ethyl ester (benzocaine) is the active ingredient in over 90 per cent of proprietary anesthetic and antipruritic ointments in this country varying from 1 to 10 per cent by weight Its solubility in ether (1 4) makes possible its prescription in flexible collodion, an excellent remedy for insect bites, especially those due to chiggers bed bugs, etc.[11]

One feature of ethyl aminobenzoate which militates against its topical use to relieve pain and pruritus is its faculty for sensitizing the individual especially when used in concentrations ranging from 3 to 10 per cent which are necessary in order for it to be therapeutically effective. Many instances of the eczematous type of dermatitis are reported in the literature In an essay on contact dermatitis due to chemicals, Sulzberger and Wise showed that concentrated solutions are more potent sensitizers than those applied in dilution.[12] Adams studied the alkyl aminobenzoates to determine their anesthetic potency and toxicity and concluded that (1) the anesthetic effect is increased with the increase in length of the carbon chain of the alkyl group, (2) the isomeric compounds are least toxic of all, and (3) the solubility decreases with each increase in molecular weight [13]

The authors in a previous report reviewed the treatment of burns and painful ulcers with an ointment containing only 0 9 per cent of the p-aminobenzoates (ethyl 0.2 per cent amyl 0 7 per cent) [14] Anesthesia was obtained by using the longer alkyl group ester (amyl) combined with a very low concentration (0.2 per cent) of the short chain ester (ethyl) This combination of aminobenzoate esters apparently affords a synergistic effect and provides for topical anesthesia while maintaining, in most instances, a concentration below the sensitizing threshold. This local anesthesia favored the restorative process and epidermization with only an occasional instance of minor irritation. The close biologic relationship between the sensations of pain, pruritus and tickle prompted use of the same ointment in other cutaneous lesions in which itching was a prominent feature.

* An ointment of the lipophilic type was used in this investigation; its percentage composition in a lipophilic base was as follows: amyl para-aminobenzoate 0 7; ethyl para-aminobenzoate 0.2; sodium propionate, 2.0; and cod liver oil 20.0 This product was supplied by Chatham Pharmaceuticals, Inc., of Newark, New Jersey and corresponds to their product, Ultracain Ointment.

TABLE 1.—RESULTS OF TOPICAL ANESTHESIA IN 105 PATIENTS

	Number of Patients	Relieved	Not Relieved	Per cent Relieved
Pruritic Dermatoses				
Pruritus ani	19	17	2	89
Pruritus scroti	2	0	2	0
Pruritus vulvae	10	6	4	60
Anogenital pruritus	5	4	1	80
Lichen simplex	6	1	5	17
Essential pruritus	4	2	2	50
Infectious eczematoid dermatitis	6	5	1	83
Pruritic psoriasis	3	3	0	100
Dermatitis herpetiformis	1	1	0	100
Pruritus gestationis	1	0	1	0
Seborrheic dermatitis	1	1	0	100
Urticaria pigmentosa	1	0	1	0
Urticaria	2	0	2	0
Painful Dermatoses				
Denuded pemphigus	3	2	1	66
Erythema nodosum	3	0	3	0
Perianal fissures	10	10	0	100
Vulval fissures	3	2	1	66
Aphthous stomatitis	3	3	0	100
Varicose ulcer	22	20	2	91

One hundred five patients with anogenital pruritus and miscellaneous dermatoses which were pruritic or painful were treated by topical application of the ointment as often as required The results are shown in Table 1

Comments

In reviewing the literature which deals with the para-aminobenzoates, it is apparent that the properties of anesthesia, toxicity, and solubility are dependent on molecular weight The long chain ester (amyl) has greater anesthetic property, less solubility, and little toxicity The short chain ester (ethyl) has great solubility, greater toxicity, but less anesthetic ability The combination of both esters in the preparation used in this study was to enable the rapid anesthesia by the ethyl ester and more effective and more prolonged anesthesia of the amyl ester

Four patients developed a dermatitis while using the ointment, three of these had used it for anogenital dermatitis, the other for a varicose ulcer Patch tests on these patients were negative, except in one man with perianal dermatitis who had previously experienced a dermatitis from benzocaine

The relief that patients obtained from the pain of anal fissures, erosions, ruptured bullae, etc was remarkable and gratifying In those with spastic rectal constipation due to fissures, results were excellent and superior to anything previously used One woman, who had previously been tattooed with mercuric sulfide for pruritus ani with no relief, obtained immediate benefit A physician who was the victim of perianal dermatitis from anal paresis following hemiplegia has been using the ointment for over a year with complete freedom from discomfort

Patients complaining of itching associated with lichen simplex, circumscribed neurodermatitis, essential pruritus, pruritus scroti and gestationis reported only slight relief from this cutaneous sensation Apparently, more effective cutaneous anesthesia is obtained where the epidermis is not intact which is probably due to a more rapid absorption of the anesthetic agent to the local nerve-ending sites through the broken epidermis, permitting a higher concentration in a shorter period of time No relief from the pain and tenderness of erythema nodosum was experienced

The most remarkable benefits were obtained in painful varicose ulcers This has been previously reported, especially as regards acceleration in the healing rate [14] The healing properties of the cod liver oil and bacteriostatic and fungistatic properties of sodium propionate were discussed in a previous paper dealing with the treatment of varicose ulcers and burns [14] This accelerated healing rate was also evident in fissured dermatitis, especially anogenital eczema The ability of cod liver oil to facilitate epidermization is well known and is apparently independent of its vitamin A and D content

Conclusions

The apparent synergism of ethyl-aminobenzoate and amyl-aminobenzoate makes it possible to use them as surface anesthetics for the relief of pruritus and pain in an ointment of the fatty type in less than 1 per cent by weight (ethyl aminobenzoate 0 2 per cent, amyl aminobenzoate 0 7 per cent) Because of this low concentration there is little tendency to hyperallergization, even after extended and constant use

THE MANAGEMENT OF THE PROBLEMS ASSOCIATED WITH PROLONGED LABOR

DUNCAN E REID M.D , Boston, Massachusetts

(From the Boston Lying-In Hospital and the Department of Obstetrics Harvard Medical School)

PATIENTS who experience prolonged labor are subject to all the hazards associated with difficult labor and delivery These patients may be as disturbing as any encountered in obstetric practice It can be granted that desultory labor may be associated with abnormalities of the pelvis or influenced by the presentation and position of the fetus, but, not infrequently there is no understandable reason for lack of adequate progress in labor It is this uncertainty regarding the ability of the uterus to perform in a normal manner during parturition that makes every parturient a possible candidate for labor dystocia

Definition and Incidence

In attempting to establish the incidence of this syndrome in a clinic or hospital, it is necessary to define what constitutes prolonged labor in that particular institution. Both definition and method of treatment employed influence the frequency of this condition. Some clinics report an incidence as high as 10 per cent, others as low as 2 per cent. The average is about 4 to 5 per cent of all labors.

It is generally accepted that eighteen to twenty hours is the extreme length of normal labor in a primigravid patient. Therefore it seems reasonable that any labor which is over twenty to twenty four hours in length should be considered a case of prolonged labor In reviewing hospital records one is immediately impressed that the onset of labor is usually entered as the time when the patient experiences painful and frequent uterine contractions The presence of painful uterine contractions is not enough to establish the diagnosis of labor These contractions must be of such quality as to produce definite changes in the condition of the cervix, exemplified either by effacement or dilation If this definition is not adhered to strictly, the true incidence of this syndrome will not be accurate.

Treatment instituted for patients who appear to be candidates for prolonged labor will have an effect on the incidence of its occurrence If one believes that these patients, whose powers of labor are insufficient to dilate the cervix readily will eventually do so if subjected to enough hours of labor and treats the patient on that premise, naturally the incidence of these cases will be high In contrast if one believes that the welfare of both mother and infant can be severely jeopardized by such extreme lengths of labor and that active measures should be instituted to improve labor and, hence effect delivery after a shorter time, there will be a further reduction in its frequency

Etiology

There being no known specific cause for the onset of labor, it follows that the etiology of this syndrome is obscure Many contributing factors have been considered. In general, they may be divided into two categories namely, factors associated with uterine motility and those concerned with the inability of the cervix to dilate So little is known regarding the physiology of parturition that it behooves one not to become too dogmatic as to which of these categories plays the more dominant role

Causative factors arising from possible faulty uterine motility are as follows (1) abnormal development of the uterus, (2) overdistention of the uterus associated with multiple pregnancy and hydramnios, (3) rapidly succeeding pregnancies with overdistention of the uterus, (4) multiple fibromyomata of the uterus, and (5) miscellaneous factors such as debilitating disease, fear of labor elderly primiparas, abnormal presentation of the fetus and pendulous abdomen with redundancy of the uterus There is no doubt that these factors do play a role in ineffectual labor, but in the majority of patients none of these is present.

Although our knowledge of the physiology of uterine motility is meager, certain observations have been made which may have some bearing on the treatment of prolonged labor It is generally accepted that the early refractional state of the uterus during pregnancy is due to the effect of progestin The activity and increased reactivity of the uterus near term have been attributed to the action of estrin. Alteration of the physiologic activity of the placenta no doubt provides hormone changes necessary to precipitate labor These hormone changes must be values which are peculiar to the onset of normal labor, for we receive the impression that patients who are definitely postmature

Presented, by invitation, at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Obstetrics and Gynecology May 20 1948.

more frequently have ineffectual labor This suggests that the hormone values in these latter patients are not properly balanced as in normal term labor, perhaps due to marked aging of the placenta

In addition to the hormone effects, the uterus is influenced by mineral metabolism There is improved uterine motility when there is an increase in available ionizable calcium or a decrease of normal potassium values Undoubtedly, the mineral metabolism is altered by shifts in hormone values

Considerable attention has been given to ascertaining the types of uterine contractions associated with both effectual and ineffectual labor Murphy, using a Lorand tocograph, has shown that uterine inertia is associated with contractions (*a*) of small magnitude, (*b*) of considerable arrythmicity, (*c*) which fail to resemble each other in magnitude and general character, and (*d*) where even a high tonus of the uterus does not increase the strength of the uterine contractions [1] By a precise method, Murphy has substantiated the clinical observation that ineffectual labor is associated with poor uterine contractility

The role which the cervix plays in the production of this syndrome has always been considered of secondary importance and so-called cervical dystocia has been thought to be a rare occurrence However, spontaneous and complete amputation of the cervix without dilation of the os does occur in labor in the presence of normal cephalopelvic relationship Certainly, these are bona fide causes of cervical dystocia The cervix may be more involved in the production of this syndrome than has been previously attributed to that portion of the uterus Recent publications by Danforth and Schwartz have added to our knowledge regarding the formation and behavior of the lower uterine segment and cervix during pregnancy and labor [2,3] Danforth has re-emphasized that the isthmic portion of the uterus should be considered a part of the corpus and that, as more space is required by the ovum, it unfolds to form the lower uterine segment Moreover, this author has presented further evidence that there is considerable variation in the amount of fibrous and muscular tissue contained in the cervix A marked preponderance of the former has been verified by Schwartz It then appears that dilation of the cervix is principally one of stretching this fibrous tissue, and there is in no sense any sphincter-like muscular action Possible differences in this composition of the cervix allow for a certain degree of speculation regarding its inconstant behavior during labor

Prolonged labor is restricted, with few exceptions, to primiparous patients Although such patients may ofttimes have a difficult pelvic delivery, subsequent labors will at least not be complicated by cervical dystocia Even a patient whose delivery has been performed through a partially dilated cervix with the aid of Dührssen's incision will dilate without difficulty in a following pregnancy This suggests that perhaps on occasion the ratio of muscle to fibrous tissue in the cervix is reversed and a sphincter-like action may be present For dilation to occur, the sphincter would have to relax with contractions of the corpus This is comparable to other organs containing a sphincter This being a possibility, there may be an upset in the neuromuscular mechanism in which the sphincter does not relax as the corpus of the uterus contracts Overcoming this sphincter-like action by disruption of the cervical tissue during labor could well facilitate labor in subsequent delivery, provided that in the puerperium there is proper healing with a minimum of scar tissue formation.

Management and Treatment

Prior to consideration of the management of patients with prolonged labor, certain basic principles should be established The problem of the contracted pelvis or large or abnormal presentation of the fetus is one of fetal-pelvic relationship Any lack of cervical dilation which often accompanies such cases is an incidental factor in obstructing progress in labor In the presence of definite fetal-pelvic disproportion, the patient, if properly managed, should not be subjected to a prolonged labor In contrast, if this relationship is so-called "borderline," the success of pelvic delivery will depend largely on the character and quality of the labor and the ability of the cervix to dilate This is true, in large measure, in patients with a normal fetal-pelvic relationship in whom there is breech presentation or nonrotation of the occiput

Maternal risk involved is not great, provided the case is carefully evaluated and properly managed This presupposes that, if operative intervention becomes necessary, this will be done at the proper time and in the correct manner The patient can be supported in labor indefinitely with adequate rest and if careful attention is given to control of fluid balance The risk will be further decreased if measures are taken to combat intrauterine infection

Fetal risk, by contrast, is a major factor in the management of these patients Fetal mortality is definitely increased at the onset of prolonged labor and increases materially when labor becomes markedly protracted [4,5] That this fetal risk is present in every labor is suggested by the fact that even in normal term labor and delivery,

where the fetus is normal, an occasional baby is lost where there is no demonstrable cause for death Autopsy findings are those associated with intrauterine asphyxia which is evidence that even in normal labor there is some degree of fetal anoxia. In prolonged labor this process is considerably exaggerated. Although we have observed a gratifying reduction in infant deaths from intracranial hemorrhage, there has been no such reduction in deaths from asphyxia. Furthermore, it must be emphasized that fetal damage caused by intrauterine anoxia is not completely reflected in the stillbirth rate alone, but the remote effects are those of severe and permanent brain injury The following table will indicate trends in these two major causes of fetal death during labor

dicated at this time, for one is unable to predict which patients are predestined to have prolonged labor Adequate fluids, preferably given intravenously to insure absorption, should be administered periodically Food and fluids when given by mouth during labor are not adequately absorbed and may give rise to vomiting with the risk of asphyxia pneumonitis from the aspiration of this irritating vomitus The urinary bladder must be carefully observed with catheterization resorted to on occasion if the patient is unable to void

With the increase of the hours of labor the degree of cervical dilation, the absolute cephalopelvic relationship, particularly with respect to the mid and lower pelvic plane, the state of the fetal membranes, and the condition of the fetus all

TABLE I.—FETAL DEATHS FROM INTRACRANIAL INJURY AND ASPHYXIA AT THE BOSTON LYING-IN HOSPITAL (EXPRESSED IN THE RATE PER 1 000 BIRTHS)

	1873–1892*	1893–1902	1903–1912*	1913–1922	1923–1932	1933–1936	1937–1941	1942–1946
Intracranial injury	1 70	1 10	1 60	2 10	5 20	1 13	1 15	1 60
Asphyxia and atelectasis	2 80	3 26	2 90	3 10	1 80	2 13	3 50	4 40

* Low incidence because of many classified as Cause of Death in Doubt.

It will be noted that during the past fifteen years there has been a definite decline in deaths due to intracranial hemorrhage This, no doubt, reflects the decrease in the incidence of traumatic pelvic deliveries. It is apparent that factors producing intrauterine fetal anoxia have not decreased

It would appear that the fundamental treatment for these patients would be to permit a sufficient test of labor without producing irreversible asphyxial damage to the fetus. In the management of these patients, the definite time of the onset of labor must be established first. This, on occasion, may be quite difficult. If the patient has difficulty in initiating labor the term "primary inertia' is applied to denote this condition This appears to be a poor term, for, if the cervix has not been changed either by effacement or dilation, the patient has not been in true labor and hence cannot have inertia regardless of the type. The time which has elapsed under such circumstances should not be considered in the total length of labor Stimulation of uterine contractions by oxytocic drugs has been suggested for the treatment of this form of inertia Here the use of such drugs is not generally effective and, if administered at this time, may produce unnecessary fetal anoxia. The indicated treatment is adequate doses of opiates and intravenous fluids until true labor ensues

Once the cervix begins to change due to effective uterine contractions, we should note carefully the time of the onset of true labor Adequate medication for relief of pain is not contraindicated assume greater importance in the proper conduct of the case

On occasion it is difficult to decide the exact degree of cervical dilation in these patients if only rectal examinations are performed Many times the cervix is thought to be fully dilated even for some hours when on vaginal examination at the time when delivery is contemplated, a considerable amount of cervix is found encompassing the presenting part. Valuable as x ray pelvimetry may be a carefully conducted vaginal examination can reveal additional information with respect to whether the dimensions of the midpelvic and the pelvic outlet will allow for successful normal or low forceps delivery This is particularly true if the latter must be performed with the aid of Dührssen's incision. Furthermore, if vaginal examination is not performed on occasion, the time at which progress in labor has ceased will not be accurately determined, and, hence there may occur many hours of needless labor with its adverse effect on the baby

The state of the fetal membranes is always an important factor in these labors Frequently, the membranes are ruptured prior to the onset of labor Whenever this occurs, the use of the antibiotics has been suggested as a routine prophylactic measure. There is no doubt that this has decreased the incidence of intrauterine infection both in the mother and the fetus. However, there are pathogenic organisms which are not influenced by antibiotics. Also, one is impressed by the fact that patients treated for many days prophylactically with antibiotics for spontaneous rupture of

the membranes will, for the first time, develop fever concomitantly with the onset of labor This emphasizes the fact that, although the findings associated with intrauterine infection may not always be present, these patients must be considered as potentially infected This fact must always be weighed when selecting the delivery procedure This is particularly true in patients who must be delivered by abdominal hysterotomy

In these patients with desultory labor, where the fetal membranes are intact, the efficacy of artificial rupture to improve the labor must be considered On occasion, such a procedure is followed by excellent progress in labor Just as often no improvement is noted, and when this occurs, an increase in fetal and maternal risk is created There are certain conditions where artificial rupture of the membranes is contraindicated irrespective of the quality of the labor These conditions are present in the pelvis with a converging bore in which there are varying degrees of mid and outlet contraction Persistent occiput posterior and transverse position of the occiput are not infrequent in many of these cases Many times the vertex is deflexed, which does not allow the presenting part to fit snugly against the cervix Hence, in these patients, the forewaters will be the most effective cervical dilator

Eventually, in the conduct of labor in these individuals, a decision must be made in regard to the length of labor that is to be allowed and the steps to be taken to effect delivery As previously stated, the fetal mortality and morbidity are of greatest concern Fetal mortality (corrected for abnormalities) in full-term, normal babies ranges from 10 to 15 per cent in this syndrome This mortality is about 6 per cent in patients entering prolonged labor, i e , twenty-four hours At sixty hours or more of labor, this mortality rises abruptly Therefore, it seems reasonable that, for the best interest of the infant, at least, somewhere between thirty to forty hours from the onset of labor is the logical time for delivery In order to do this, the maximum amount of progress in labor must be obtained at the end of that time

Careful observation must be made to detect lack of progress resulting from secondary uterine inertia It must be remembered that hours of labor without progress can be as damaging to the fetus as labor with adequate progress

Until we know the physiologic cause of labor, it is unlikely that the ideal uterine stimulant for secondary inertia or functional dystocia will be available Regardless of its controversial aspects, we believe that posterior pituitary extract does offer the best therapeutic help in the treatment of these patients As we have previously stated, we have not been impressed by the dangers emanating from the drug but rather by its limitations We would restrict its use to primiparous patients with secondary uterine inertia, in whom the cephalopelvic relation is normal Fortunately, this will include most of the patients with prolonged labor

The drug is given in the thirty- to forty-hour period to overcome the presence of secondary inertia It is administered for two reasons first, to produce uterine contractions sufficient to increase the dilation of the cervix, and, second, to demonstrate over a comparatively short time whether the uterus will ever have the ability to contract sufficiently to produce this dilation

The drug is administered intramuscularly beginning in $^1/_2$- to 1-mm doses The physician in charge should make careful observations as to the degree of contraction and the relaxation of the uterus Tetanic contractions of the uterus are extremely rare, and should they occur, they usually appear with the first dose rather than with subsequent administration of the drug The drug is given again within twenty to thirty minutes if effective uterine contractions have not occurred A series of doses at such intervals, increasing in amount up to three minims for a single dose, are administered until effective uterine contractions are produced If progress in labor is re-established from the effect of the drug, the cervix should, on the average, be completely dilated in the ensuing three to four hours from the time of the initial dose Pelvic delivery can then be accomplished either by low forceps or normally However, if appreciable progress has not been accomplished at the end of that time, additional dosage of the drug will be unlikely to produce progress Actually, continuation of such therapy may produce an unneccessary degree of intrauterine asphyxia Should a trial of pituitary extract fail to produce progress during the critical thirty-to forty-hour period of prolonged labor, further procrastination regarding delivery will only increase the incidence of irreversible anoxial damage to the fetus Delivery should then be performed in the least traumatic manner

The decision regarding the type of delivery depends upon two factors namely, the degree of cervical dilation and the station of the presenting part If the cervix is more than half dilated, the presenting part nearing the pelvic floor, and the outlet ample, pelvic delivery, with the aid of Dührssen's incision if necessary, should be performed If these conditions are not fulfilled, abdominal hysterotomy is probably a less traumatic and safer procedure

The method of treatment of potentially infected cases of prolonged labor who must be delivered by abdominal hysterotomy is still a controversial subject Procedures employed range

from the generous use of the antibiotics in labor followed by transperitoneal section, to a radical cesarean section, i.e., section followed by hysterectomy. Whether the former procedure is sufficient to prevent peritoneal infection is still to be established. Certainly, there is considerable mortality associated with radical or Porro section when performed in the presence of definite uterine infection. It would seem more reasonable to employ the virtues of the antibiotics and, at the same time, use a type of operation that does not permit contamination of the peritoneum by the spill of infected uterine contents. Any of the extraperitoneal types of cesarean section can provide this added safety.

The relief of pain during these labors is not too satisfactory. As soon as there is lack of progress analgesic drugs are not given, in the hope that nothing will be done to abolish labor or to contribute to fetal anoxia. Careful choice of the terminal anesthesia is important, particularly if an operative delivery is contemplated. Again, the type of anesthesia used should not contribute to fetal anoxia.

Conclusion

The treatment of cases of prolonged labor must take cognizance of the following factors: length of labor, intrauterine infection, fetal anoxia, the need for proper analgesia and anesthesia, and the correct method of delivery.

THE PRESENT STATUS OF PRESERVATION OF THE ANAL SPHINCTER IN RADICAL OPERATIONS FOR CARCINOMA OF THE RECTUM AND RECTOSIGMOID

A. O. Wilensky, M.D., New York City

THERE is continuous renewed interest in the possibility of preserving the sphincter ani in the radical removal of carcinomata of the rectum and rectosigmoid.* Unfortunately the issue of sphincter preservation has been confused with, and clinical interest has been diverted to and more or less concentrated upon accomplishing this purpose through the abdominal route alone—the so-called anterior resection. This is perhaps, deplorable because the point at issue is not which route is employed for accomplishing this highly laudable purpose but the preservation of the sphincter or the restoration of a sphincter function, preferably the former.

With the older methods, practically all of the attempts were based upon some form of plastic procedure in which a more or less new anatomic structure was made, by which it was hoped that a new sphincteric action could be accomplished. This usually failed primarily because of infection and technical difficulties.

Nowadays, the possibility of preserving the sphincter is, in the last analysis, entirely dependent upon the physical situation of the growth with respect to the anus. When the lower margin of the growth is at least 3 inches from the anus, it is technically feasible to remove the malignancy radically and to preserve the sphincter no matter what path of approach—abdominal, posterior and/or combined—is employed. With modern methods and technic a one-stage straightforward resection of the tumor bearing segment with immediate end-to-end two- or three-layer circular suture seems, by all accounts and according to my own experience, to be the best method of operation in nonobstructive cases and is much superior to the pull-through and other plastic methods of restoration of the sphincter function. There is no doubt that the success which has followed the new methods of operation with preservation of the sphincter has been vastly increased by the availability of antibiotics and chemotherapy. The present tendency is to do all of this

* It is most regrettable that in comparing the various publications on this all-important subject, there should be difficulty because of confusion in the usage of anatomic terms in differentiating the various segments of the terminal part of the left half of the large intestine and because of any obscurity in the descriptions of the various operative procedures and their connotations as regards the preservation of the normal sphincter or the substitutional restoration of a sphincteric function by a form of plastic operation.

in one stage in the nonobstructive cases without regard to the method of approach Except among a few groups, more and more men are doing the operation without the simultaneous performance of a colostomy This has been my own practice also

All of the criteria from which decisions must be made regarding the operability of any given case are independent of the path of approach and of the question of preserving the sphincter and remain based on the tried traditions and practice of successful surgery The exercise of this discipline has also always been my practice from the very beginning

The published statistics indicate that the resectability (operability) rate varies in various hands from 35 to 80 per cent The wide difference in these figures undoubtedly corresponds to personal factors The higher figure may also carry a certain amount of error Both of these indicate further that the procedure has not as yet been sufficiently standardized

TABLE 1 —Resectability Rates

	Total Number of Cases	Number of Operations with Sphincter Preservation	Total Resectability Rate—All Cases Per Cent	Resectability Rate with Sphincter Preservation Per Cent

Wilensky[4–6]	83	15	83	35

The literature indicates that with preservation of the sphincter the average mortality rates vary from a low of 3 4 per cent (Dixon—recent figures) to a high of 8 9 per cent (Coller and Ransom) [7 8] Other series show mortalities from 12 to 21 per cent (Table 2) The literature indicates that with preservation of the sphincter, the average mortality rate is not any higher than when the latter is sacrificed, and, remarkably, it is noted that frequently the mortality is less [1]

	41	3 4 (recent cases)
Zinninger and Hoxworth[15]	18	12+
Koch[16 17]	66	21 0
Wilensky[4–6]		11 0

The postoperative course is not unduly prolonged There are few extraordinary postoperative complications There is no difference in the frequency of any postoperative bladder dysfunction in any of the types of operative approach or in the operation itself, and, in any case, this seems to be a temporary affair only However, it is noted that in the male subject impotence follows in about one half of the cases in which the anatomic sphincter is preserved or its function restored, whereas after abdominoposterior complete removal of the rectum and its sphincter ani, impotence after operation has been reported in as high as 95 per cent of the cases

With the modern end-to-end circular suture method of preservation of the anatomic sphincter, bowel function is perfect when healing is completed In the methods of restoration and/or reconstruction of the sphincter function (pull-through operation and/or other plastic procedures), incontinence results and/or follows with more or less completeness in from 50 to 75 per cent of the cases In the past, this has undoubtedly been one of the deterrent factors for the preservation of the sphincter This information is shown in the following table

TABLE 3 —Types of Operations and Resultant Continence

	Type of Operation	Per Cent Continent	Degree of Continence
Mandl[1 2]	Circular suture	49 4	Complete
	Pull-through	64 5	Complete
Koerbl[16]	Hochenegg	36	Complete
	Kraske	66	Complete
Du Pan[19]		20	80 per cent partial
Gersuny[20]		75	Satisfactory
Bacon *et al* [13]	Constant change in technic	70–75	Variable
Wilensky[4–6]	End to-end suture	100	100 per cent

Without node involvement local recurrences occur in 4 6 per cent of the cases and with node involvement in 23 2 per cent (Gilchrist and David) [21] Without this differentiation the series of D'Allaines and Vernejoul show 17 8 per cent recurrences after resections and 25 per cent after complete proctectomy, and my own cases show an equal rate of 5 5 per cent in either case (Table 4) [22 23]

In general, as also with sphincter preservation or restoration, local recurrence of the malignancy in the operative area depends to a much lesser degree on the extent of the growth in the longitudinal axis of the bowel To a much larger degree, it depends upon the spread of the tumor cells through the thickness of the rectal wall and out into the rectal capsule and pelvic fatty areolar tissue Local spread of the latter kind is already present in from one half to two thirds of the cases at the time of operation [21] When operation is done from the abdominal route exclusively (anterior resections) and the individual case is badly selected, the rate of local recurrence is somewhat higher When there is lymph node involvement,

TABLE 4.—LOCAL RECURRENCES

	Elapsed Period Years	Number of Cases	Recurrences after Resection Per Cent	Recurrences after Proctectomy Per Cent	Survival Rate Per Cent	Survival Rate after Proctectomy Per Cent
D'Allaines and Vernejoul[27,12]			17 8	25		
Mandl[1]	3	1,000			33 37	26–31
Finsterer[4,13] (1941)	5				33 5	22 5
Wilensky (1947)[1–4]	1 2	86	5 3	5 5	75	50

the rate of local recurrence rises abruptly In any case, local recurrence occurs equally and seems independent of the method of approach and does not seem to be materially different in series of cases with or without preservation of the sphincter

The five- and ten year survival rates in the reported series of cases vary from 51 8 per cent without node involvement to 23 per cent with node involvement [21] Most of the series do not make this differentiation, and then the survival rate varies from 26 per cent to 35 per cent [4 6 12]

TABLE 5.—SURVIVAL RATES

	Observation Period, Years	Per Cent Without Nod Involvement	Per Cent with Nod Involvement	Per Cent Nodes Not Mentioned
Sauty Dargent and Michaud[24,25]	5			50
Colcock[5]	5	60	30 2	
	10	51 8	23 2	
Babcock and Becon[14]	1–3			81
	5–10			38
Mandl[1]	3			33 37
Fieslsberg, Payr Sauerbruch, Galeda and Kirschner[26]	3 (Av)			70
	5			23
Wilensky[1–4]	2			14
	3			7
	10			27
Koch[16]	2			60
	3			50

At the present writing the survival rate with sacrifice of the sphincter is superior only when there is no extramural spread of the malignancy and when the lymph nodes are not involved with tumor growth This is, of course, true with all forms of operation Otherwise the reported survival rates show a balance remarkably in favor of operation with preservation of the sphincter (Mandl series and Finsterer series approximately 30 per cent more Wilensky series about 50 per cent more) [1 22 23 4]

It seems fair to say that sphincter preservation is in its early stages of modern development The individual series of cases are still very small and do not yet approach the magnitude of earlier series of cases in which the older types of operation were practiced and in which the sphincter was routinely sacrificed It also seems fair to assume that the results of operation with sphincter preservation will continually improve with further more extended experience as have other types of operation performed under modern conditions It seems true that some of the criteria of tumor growth and spread which brought about the Miles and other similar types of radical operation with ruthless removal of the sphincter must be somewhat modified in the light of modern thought and practice [27]

Chest pain referred to the arm not related to exertion is more suggestive of chest tumor than of heart disease —*Exchange*

Wheezing in the chest especially if unilateral, is very suggestive of foreign body tuberculosis or tumor —*Exchange*

A NEW METHOD IN THE MANAGEMENT OF ACUTE ANTERIOR POLIOMYELITIS

EMIL SMITH, M D , DAVID J GRAUBARD, M D , NORMAN GOLDSTEIN, M D , and WILLIAM BIKOFF, M D , Brooklyn, New York

(From the Communicable Disease Service, Kingston Avenue Hospital for Communicable Diseases)

ONE of the major problems in the management of acute anterior poliomyelitis is the alleviation of pain and spasm Since the recognition of this disease, many investigators have attempted to describe the pathogenesis of the symptom-complex of pain and to evolve a method for its control It is not the purpose of this preliminary report to compare procedures but to present clinical evidence as to the origin and control of pain and spasm

Kuntz states "In cases of poliomyelitis, muscular paralysis is accompanied by segmental vasomotor and sweat secretory disturbances In this disease, the inflammatory process in the spinal cord may involve the intermediolateral cell column directly, but, not infrequently, pathologic changes also occur in the corresponding ganglia of the sympathetic trunk "[1] Bodian in reviewing 24 fatal cases found the intermediolateral or sympathetic cell columns little involved, except for one case of considerable destruction [2] Many clinicians have indicated the existence of sympathetic imbalance in poliomyelitis [3 4] Smith and his coworkers have shown definite histopathologic changes in sympathetic ganglia in two fatal cases [5] They have summarized their findings as follows "Ganglion cells appeared shrunken, and nuclei were obscured or absent Some coarse basophilic granules were seen in the cytoplasm, nuclear-cytoplasmic distinction was unclear in some cells, and in others the nucleoli appeared fragmented Distinct neuronophagia in the sympathetic ganglia was not seen, leading us to the belief that the changes were probably reversible "

In a series of 46 lumbar sympathectomies, Harris and Harris and McDonald obtained good results in children with residual paralysis following anterior poliomyelitis [6 7] Hyperemia was maintained in 32 cases Accelerated rate of growth on the operated side was noted in 26 cases of the series Similar results were obtained by Telford, and White and Smithwick [8 9]

The mechanism of vasospasm can be summarized briefly as a defense mechanism of tissue response When an irritable focus is established in the periphery, the organism reacts by vasospasm and exudate. These usually subside at the time healing is completed However, if an irritative focus persists, a reflex arc producing pain and spasm is established This arc may perpetuate itself through the internuncial pool and eventually involve the sympathetic motor neuron cells in the lateral horn [10 11] As a corollary we can recognize that direct involvement not only of the lateral horn but also of the sympathetic chain can produce a similar picture

It can readily be seen that interruption of the cycle of reflexes is, therefore, the method of choice The results achieved in cases of trauma with the intravenous administration of procaine have indicated that the symptom-complex of pain may be controlled in this way [12–14]

Material

In the summer of 1948, 159 cases of acute anterior poliomyelitis were admitted to the Kingston Avenue Hospital Eighty cases were not treated by the method to be described because they were of the bulbar type, because they presented no evidence of pain or spasm, or because they showed pure anterior horn involvement. Cases of the bulbar types were excluded, since the occurrence of fatality might have been attributed erroneously to the method of treatment The remaining 79 cases were treated with intravenous infusions of procaine, by administration of Priscol, or by diethylaminoethanol * No deaths resulted in the treated group

Although this investigation was originally undertaken to determine the efficacy of procaine hydrochloride administered intravenously in cases of acute poliomyelitis, it was thought worthwhile to investigate Priscol hydrochloride (2 benzl-4,5 imidazoline hydrochloride) also, because of its known sympatholytic action and diethylaminoethanol hydrochloride because of its procaine-like action as an analgesic [5 15–18]

Dosage and Administration

During the first month of this three-month survey, therapy in all cases was instituted only after the patient's temperature returned to normal in

Presented at the Clinical Conference Kingston Avenue Hospital for Communicable Diseases Brooklyn October 7 1948

REMINDER

(Courtesy Mother Nature)

THE TURN OF SUMMER into fall is Nature's most poignant reminder of another year gone by.

It's a reminder that should make you think, seriously, that you yourself are a year closer to the autumn of your own particular life.

What steps have you taken—what plan do you have—for comfort and security in those later years?

You *can* have a very definite plan—one that's automatic and *sure*.

If you're on a payroll, sign up to buy U. S. Savings Bonds on the Payroll Plan—through regular deductions *from your wages or salary*.

If you're not on a payroll but have a bank account, get in on the Bond-A-Month Plan for buying Bonds through regular charges to your checking account.

Do this—stick to it—and every fall will find you richer by even more than you've set aside. For your safe, sure investment in U. S. Savings will pay you back—in ten years—$100 for every $75 you've put in.

AUTOMATIC SAVING IS SURE SAVING—

U.S. SAVINGS BONDS

of agreement

Pediatricians and geriatricians agree upon the need for prompt control of cough because its effects are particularly exhausting upon the child and the aged.

Experience is the Best Teacher

R. J. Reynolds Tobacco Co. Winston-Salem, N. C.

John William Ballantyne

(1861 1923)

proved it in obstetrics

BALLANTYNE, in his earl studies of anatomical an pathological conditions found i the new born, sensed the valu of routine prenatal care in ol stetrics. At the same time othe obstetricians were beginning t realize the necessity of greate attention during the ante partu period as a result of their invest gations of eclampsia It remaine for Ballantyne, however to b the first to establish a clinic fo the expectant mother World wide acceptance of his concept quickly followed Ballantyne successful experiences in prena tal supervision

EXPERIENCE IS THE BEST TEACHER IN CIGARETTES, TOO!

Yes experience *is* the best teacher in choosing a cigarette! Millions of smokers who have tried and compared many different brands of cigarettes have found that Camels suit them best.

Try Camels. See if your *own* taste doesn't appreciate the rich full flavor of Camels See if your *own* throat doesn't welcome Camel's cool, cool mildness

Let your own experience tell you why with scores of smokers who have tried and compared, Camels are the "Choice of Experience."

According to a Nationwide survey:

More Doctors Smoke CAMELS

than any other cigarette

Reclaiming Nature's failures

The physician may now offer encouragement to the patient with a history of *habitual abortion*. PRANONE* Tablets supplying corpus luteum activity orally offer hope for a high degree of fetal conservation. With the help of PRANONE, which enhances formation of a secretory endometrium and sustains the embryo against premature expulsion, 80 per cent of patients have been brought to term.[1,2] Indeed the corpus luteum hormone has been so successful in correcting "relative" sterility due to abortion that Mazer and Israel[4] describe it as having "unimpeachable value and total harmlessness."

PRANONE

(ANHYDROHYDROXY PROGESTERONE U.S.P. XIII)

PRANONE Tablets constitute a great advance in controlling *threatened abortion* also for they permit quick and effective self administration of the corpus luteum factor at the moment vaginal staining is detected. PRANONE Tablets may therefore, provide a vital margin of safety pending the physician's arrival.

PRANONE—Anhydrohydroxy progesterone U.S.P. XIII Tablets of 5 or 10 mg., boxes of 20, 40, 100 and 250 tablets; also 25 mg., boxes of 20 and 100 tablets.

combined

3 IMMUNITIES CONCURRENTLY CONFERRED

Combining three antigens into one preparation Parke-Davis DIPHTHERIA TETANUS PERTUSSIS (Combined) stimulates simultaneously the production of antibodies protective against diphtheria, tetanus and whooping cough Use of this effective and conveniently administered triple antigen greatly simplifies the immunization schedule—a factor of importance to physician patient, and parents alike

DIPHTHERIA TETANUS-PERTUSSIS (Combined) is supplied in 8 cc vials (one immunization course) and 15 cc. vials (five immunization courses) Each cubic centimeter contains 80 000 million phase I *Hemophilus pertussis* organisms and one immunizing dose each of diphtheria and tetanus toxoids An immunizing course consists of three 1-cc. doses given subcutaneously at three or four week intervals

middle age — a positive outlook on life

Relief of the physical and mental distress so often associated with declining ovarian function usually restores to the menopausal patient a positive outlook on life

Prompt alleviation of disturbing climacteric symptoms may generally be expected with "Premarin," and in the majority of cases symptomatic improvement is followed by a gratifying sense of well being This is the "plus" afforded by this naturally occurring orally active estrogen

Three potencies of Premarin enable the physician to adapt estrogenic therapy to the particular needs of the patient Tablets of 2.5 mg 1.25 mg and 0.625 mg are available also liquid 0.625 mg in each 4 cc (1 teaspoonful)

While sodium estrone sulfate is the principal estrogen in Premarin other equine estrogens estradiol equilin equilenin hippulin are probably also present in varying amount as water soluble conjugates.

CAMP

For patients of intermediate and stocky types of build

LUMBOSACRAL AILMENTS

An Orthopedic Surgeon* in writing on the treatment of lumbosacral disorders in his book Backache and Sciatic Neuritis states as follows:— "Every patient should be given prolonged conservative treatment before radical measures are considered Non-operative treatment consists of recumbency in bed, the application of support (adhesive strapping and belts of various types) and physical therapeutic measures. When backache at the lumbosacral junction is uncontrollable by such measures, a fusion operation is recommended."

The Camp Support (illustrated) is a practical, comfortable aid in lumbosacral disorders

The side lacing adjustment provides a steadying influence upon the pelvic girdle and the lumbosacral articulation The back is well boned, resting and supporting the lumbar spine

The garment is easily removed for physical therapeutic treatments

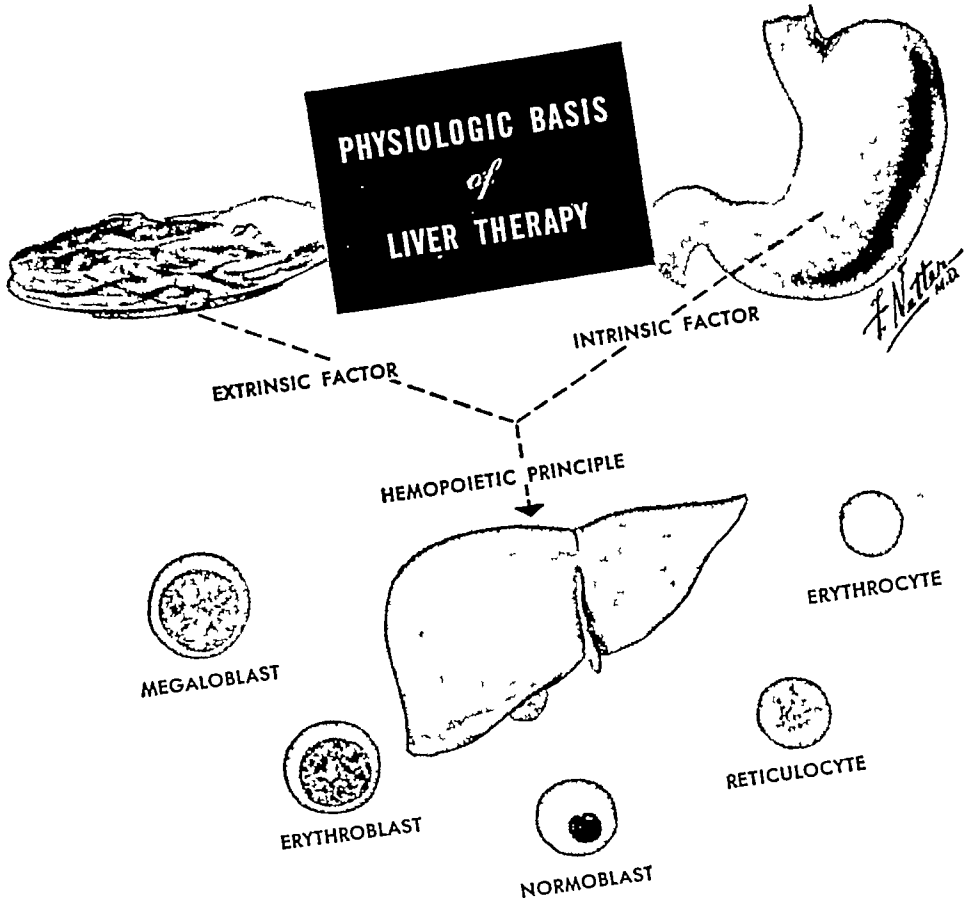
a natural preference

A revealing test[1] recently was conducted on a group of cardiac *patients in congestive failure treated with intramuscular injections* of different mercurial diuretics, the identities of which were unknown at the time to both patients and observers. The results showed that the majority clearly evinced a decided—and natural—preference for a diuretic agent that caused the least pain and discomfort—

MERCUHYDRIN®

Similarly Gold *et al*[2] prefer MERCUHYDRIN in their routine treatment of the failing heart because "it is less irritant to the muscle and is less apt to produce pain"



MERCUHYDRIN is also preferred by the treating physician because of its dependability It is well tolerated systemically [3,4] excellent water and salt diuresis is obtained,[1 4-6] and the diuretic response by intramuscular injection is the same as by intravenous injection.[1 4] With a systematic schedule of early and frequent administration producing controlled diuresis MERCUHYDRIN aids greatly in prolonging the life decreasing the invalidism and adding to the comfort of the cardiac patient. Symptoms of failure such as peripheral edema paroxysmal dyspnea or acute pulmonary edema, are prevented or minimized, and the distressing consequences of intermittent massive diuresis are obviated.

DOSAGE: MERCUHYDRIN 1 cc or 2 cc. intramuscularly or intravenously injected daily or as indicated until a weight plateau is attained. Subsequently the interval between injections is prolonged to determine the maximum period permitted to intervene between maintenance injections.

PACKAGING: MERCUHYDRIN (mersalkoside sodium solution) is available in 1 cc. and 2 cc. ampuls.

Lakeside Laboratories, INC., MILWAUKEE 1, WISCONSIN

The liver is the storehouse for the *hemopoietic principle*, which, according to Castle, is a combination of an *extrinsic factor* derived from food and an *intrinsic factor* produced by the stomach Liver Extract is believed also to contain certain secondary blood building elements The therapeutic properties of liver extracts may vary widely — and indeed outstanding authorities have reported that many failures in pernicious anemia therapy are due to the use of inert or deficient extracts

In the production of ARMOUR LIVER PREPARATIONS, every precaution is taken to preserve the blood regenerating, active constituents of the fresh liver The finished extracts are tested carefully for therapeutic effectiveness on actual pernicious anemia patients in relapse

Have confidence in the preparation you prescribe or administer — specify "ARMOUR"

Armour Liver Preparations

Liver Liquid Parenteral

4 U S P Injectable Units per cc 1 cc., 5 cc., and 10 cc. rubber-capped vials A preparation retaining the secondary hemopoietic factors and most of the vitamin content of the liver

Orapen-250

It is now possible to give 250 000 units of crystalline penicillin G (potassium salt) in one coated pleasant tasting, buffered tablet, if you specify the Schenley product. Ample evidence supports the value of the oral administration of penicillin when given in sufficiently high dosage. Clinical reports show that even serious infections due to penicillin sensitive organisms—such as acute respiratory illness,[1,2,3,4] impetigo[4] gonorrhea[5] and rheumatic fever (prophylaxis)[6]—can be treated effectively by this convenient painless method of administration.

ORAPEN IS UNIQUE
A special coating completely masks the taste of penicillin. ORAPEN is stable at ordinary room temperatures, eliminating necessity for refrigeration.

new product brief

Dihydrostreptomycin Squibb

WHAT IS IT?	A potent antibiotic compound derived from streptomycin by reduction with hydrogen
WHEN IS IT INDICATED?	Like streptomycin, as an adjunct to other measures in tuberculosis; particularly the following types: pulmonary (exudative, hematogenous, and pneumonic); renal; miliary tuberculous meningitis, peritonitis, lymphadenitis cutaneous sinuses and fistulae; tuberculosis of larynx, trachea, and bronchi, alimentary tract, and bones and joints; also pre- and postoperatively in pneumonectomies lobectomies; in thoracoplasties if postoperative spread develops
HOW DOES IT ACT?	The antibacterial activity of Dihydrostreptomycin usually parallels that of streptomycin in tuberculosis Resistant strains of organisms appear to develop as rapidly as with streptomycin
WHAT ARE ITS ADVANTAGES?	Dihydrostreptomycin is significantly less neurotoxic than streptomycin and hence can be given in larger doses and for more prolonged periods In addition, patients showing allergic reactions to streptomycin have been able to continue with the dihydro form
HOW IS IT ADMINISTERED?	Only intramuscularly Suggested concentration — 250 to 500 mg per cc.
WHAT IS THE DOSAGE?	Daily doses of 2 grams of Dihydrostreptomycin Squibb may be given safely for periods equal to those in which streptomycin has been restricted to 1 gram a day, provided there is no renal dysfunction Average dosage—1 to 2 grams daily in divided doses every 12 hours
HOW SUPPLIED	20 cc. vials containing the equivalent of 1 Gm streptomycin base 50 cc. vials containing the equivalent of 5 Gm streptomycin base

E R SQUIBB & SONS, NEW YORK

Findings from the Saratoga Spa records*

CORONARY DISEASE

One hundred seven coronary cases were recently studied Of this group 33 were females, 74 males, the latter being chiefly from executive and professional walks of life Not a few were physicians The average age was 61, the range being 40 to 80 years The average duration of symptoms was three years, the limits being one month to 10 years In 32 there was a definite history of coronary occlusion Twenty seven had a history of pre existing high blood pressure, eight of low pressure

Classified according to the American Heart Association 44 were in Class IIA (activity slightly limited) and 63 in Class IIB (activity greatly limited)

Before beginning a regime each patient was subjected to a thorough physical examination together with all indicated lab oratory procedures The average of the initial blood pressure readings made at this time was 168 95 The final average figure arrived at was 140-81, a difference of 28 mm of mercury in the systolic and 14 in the diastolic reading These readings were made after a rest period to ob viate the influence of any recent activity

Symptomatic Change According to Age Groups

Age group	No Cases	Improvement Moderate	Marked	None
40 50	11	10	0	1
50-60	41	32	5	4
60 70	34	22	8	4
70-80	18	16	0	2
80-	3	3	0	0
	107	83	13	11

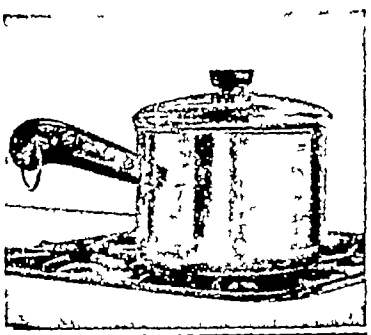
YOUR PRESCRIPTION
YOUR ADVICE

Two delicately balanced approaches to the problem of the menopause



Conestron oral therapy provides an especially flexible method of prescribing for the progressive physical and mental adjustments of the menopause. This method results in a minimum feeling of distress a maximum feeling of well being for the patient *Conestron consists of water soluble estrogenic substances from natural sources Two strengths —0 625 mg and 1.25 mgs Bottles of 100 and 1000 tablets*

To supplement your advice and to enable your patients and their families to arrive at a better home adjustment during this difficult menopausal period the booklet *Through One of Life's Progressive Changes* is available to physicians gratis, in distribution quantities

Wyeth PHILADELPHIA 3 PA **Conestron®**

Orally Active • Well Tolerated

Estrogenic Substances (Water Soluble)

1. Boil the water and cool to luke-warm

2. Float measured powder on top of the water

3. Mix with a large spoon or fork

SIMILAC FEEDINGS ARE Easy TO PREPARE

It takes only 30 seconds to induce solution *if the powder is floated on top of the water.* Lukewarm, boiled water is desirable.

No need to mix several ingredients—hence the possibility of errors in measurement is greatly reduced.

The ratios of fat, sugar, and protein, *and the zero curd tension*, remain constant regardless of concentration . . . Therefore, no gastrointestinal disturbance will normally occur, should the mother err occasionally in counting the number of measures of Similac powder.

The level tablespoon measure in each can eliminates the possibility of underfeeding or overfeeding due to varying sizes of "tablespoons."

Result: Similac reduces dietary disturbances traceable to mothers' errors in preparation of the formula

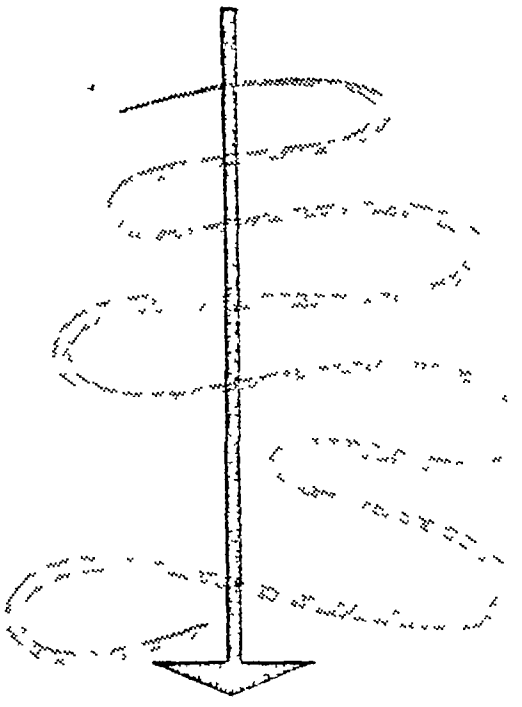
A Single Injection Every Other Day

Antibiotic therapy is greatly simplified when C S C Crystalline Procaine Penicillin G in Peanut Oil with aluminum monostearate is prescribed A single 1 cc injection (300,000 units) produces therapeutic blood levels for 96 hours in over 90% of patients, *and for 48 hours in all patients* For certainty of therapy, this preparation need not be given as a rule, more often than once every other day



Crystalline Procaine Penicillin G in Peanut Oil C S C contains 300,000 units of micronized procaine penicillin per cc, together with 2% aluminum monostearate for producing a thixotropic suspension This outstanding penicillin preparation is free flowing and requires no refrigeration It is indicated in the treatment of most infectious diseases amenable to penicillin therapy

Available at all pharmacies in economical 10 cc size rubber stoppered vials (300,000 units per cc), and in 1 cc. size (300,000 units) glass cartridges for use in the C S C Disposable and Permanent Syringes

96-HOUR
CRYSTALLINE PROCAINE PENICILLIN G
IN PEANUT OIL
WITH 2% ALUMINUM MONOSTEARATE

direct route

Whenever oral vitamin B complex therapy seems ineffective, Ampoules 'Betalin Complex' (Vitamin B Complex, Lilly) are recommended for intravenous or intramuscular use in doses of 1 to 4 cc daily. The *direct route* assures complete utilization. Impaired absorption is circumvented, and large amounts of the B complex vitamins are immediately available.

'Betalin Complex' is a prepared solution containing in each cc

Thiamin Chloride	5 mg
Riboflavin	2 mg
Nicotinamide	75 mg
Pantothenic Acid (as Calcium Pantothenate)	2.5 mg
Pyridoxine Hydrochloride	5 mg

Christmas, 1948

This is not the best of times, it is not the worst of times Our world, the "one world" of the future, is unhappy and unsettled—yet in the approaching yuletide season all peoples will pause to bask in the Christmas spirit, in the joy of giving and receiving, in remembering that for which we celebrate this holiday

Fortunate it is that, once a year, the Christmas holiday, with its aura of peace and happiness, assumes the place of importance in our lives No matter how busy or how complicated our existence—it is impossible to ignore the humble greetings, the familiar Noels the midnight carols—or the desire that every one shall be safe and cared for For this season, at least, the violence of opposing forces and the discordance of quarreling groups is overshadowed by festive spirits and good will

Our wish for you, then is that your Christmas may be merry, and that you may find time for happiness, hours for contentment and well being for the tasks ahead

The Moving Finger Writes

And, having writ, moves on , leaving interesting prospects for the practice of medicine in its train To the putative certainty of Poor Richard's "death and taxes" shortly may be added compulsory sickness insurance and higher taxes. What the citizens have bought they must eventually pay for in some kind of currency

We remember distinctly the gloomy prognostications of a number of generations of American citizens of the head-shaking and/or finger-wagging armchair philosopher variety that this country was going to the dogs. Or maybe over the hill to the poor house, the sense being in either case that rack and ruin stared us in the face Hard times we have had but not yet ruin

Well, here we are for better or worse, for

richer or poorer The Republic seems to have held together so far, contrary to many expectations, and in spite of undercover work by agents of foreign powers A new year lies ahead It is to be hoped that medical statesmanship in dealing with the new administration will take carefully into consideration the fact that it was continued in power by the citizens of this Republic who have thus approved its policies in general, as far as those citizens could comprehend them

National health insurance has been a major domestic objective for some time It does not seem probable that it will be abandoned in the forthcoming years Not because of a realization by its proponents of the validity of arguments against it by the medical profession will it be held in check, but by the direct inescapable responsibility of the incoming administration with a majority in Congress for the enormous and growing costs of the ERP, the huge national debt, the expanding military establishment, the cost of support to China, and the ticklish possibility of a sudden and catastrophic war

National health insurance, with its initial billions of cost regardless of its other and much more serious defects, probably would not for fiscal reasons take precedence over the urgent necessity for immediate and painful increases in income and corporation taxes merely to support what domestic blessings we now enjoy

Meanwhile, the voluntary prepayment plans seem to be making substantial progress This progress will, in all likelihood, accelerate in the next few years as the net balance of personally spendable income after taxes decreases sharply

Medical statesmanship will take into account the fact that the citizens of this nation get what they want, that statistical studies do not always correctly evaluate those wants, that it is incumbent upon the medical profession in its *advisory* capacity to the people of the nation to reiterate the known facts concerning disadvantages of compulsory insurance systems as these affect the quality of medical service If, then, against informed advice, the public insists on national health insurance, medical statesmanship will not have been found wanting

The moving finger, having writ, moves on, "nor all your Piety nor Wit shall lure it back to cancel half a line "

Stop, Look, Listen, II

In our first editorial under this title we discussed the objectives of the World Medical Association as set forth in the twelve resolutions of the Second Annual Meeting of the Association at Geneva [1]

Does it appear odd to anyone that the representatives of 29 nations, speaking different languages (one of them, Bulgaria, from behind the Iron Curtain) should be in unanimous agreement on a set of twelve resolutions governing "social security," if such legislation includes medical care? To the representatives of most of those 29 nations the inclusion of medical care in "social security" or compulsory health insurance schemes was a reality Reporting the proceedings to the October meeting of the Council of the Medical Society of the State of New York, Dr Louis H Bauer, Secretary-General of the United States Committee of the W M A said

> They spent nearly a day and a half in discussing social security and health insurance, because that is a very important factor in their lives They all have it, and they all wish they did not have it They would like to do something to protect what little freedom they have left, and if possible to get some back that they have lost [2]

These doctors of 29 nations are furnishing the physicians of this country a picture of the disaster of governmental control of medicine through "social security" where this includes medical care, a disaster of such magnitude that to salvage some shards of liberal medical practice from the rubble, they must depend upon the W M A and the help which we in this country can still provide Dr Bauer said further

[1] New York State J Med 48 2575 (Dec. 1) 1948.

[2] Minutes of the Council October 1948

Perhaps some of you saw the editorial which appeared in the A.M.A *Journal*, urging state and county societies and national organizations to become supporting members of the United States Committee of the World Medical Association and I wish to talk on that

As you know, the income of the World Medical Association itself is infinitesimal in that it gets only dues from member associations, many of whom have little or no money and if they have they cannot pay their dues because they cannot get the money out of their country We had, up until last April three bank accounts, one in Zurich, one in Paris and one in London The money in Paris and London can only be spent in those countries because they cannot send it out so we established a new account in New York in April to which our own dues (the American Medical Association's ues) and the dues of the Canadian MedicaldAssociation and some of the Latin American countries are being paid in dollars here in New York and where of course we can use it, but even so the income is altogether too little. So the United States Committee was formed to raise money really to support this organization in the way it should be run One of the strings attached to that offer was that the headquarters of the organization were going to be located in the United States We said North America, then they picked the United States and that was agreed to We have agreed to underwrite the expenses of that Secretariat, the traveling expenses of members of the Council, and the publication of a Bulletin We first thought that it could be done on $50 000 a year Now we know that that is not adequate, it is going to cost $75,000 to $100 000 a year The A.M.A., the Mayo Clinic and the International College of Surgeons have each contributed $2,000 a year toward the support of this. Many of the national industrial organizations have contributed The National Foundation for Infantile Paralysis and the American Red Cross have each contributed $5 000 The Pfeiffer Foundation contributed $10,000, and a number of others have contributed from $1,000 to $5 000 Some of the other national medical associations are contributing and this editorial urges county and state societies to become members.

The Medical Society of the State of New York has become a member of the United States Committee It is to be hoped that the component county medical societies of this State and many individual doctors will become members also Encouragement of the World Medical Association would seem to be not only the support of an ideal, but good, hard, common or horse sense That which benefits the medical profession of the entire world helps every individual patient and his doctor

Send your application for membership to United States Committee, Inc, World Medical Association, 2 East 103rd Street, New York 29, New York

J.A.M.A. 138:366 (Oct. 2) 1948.

Current Editorial Comment

Serum Hepatitis Some of the doubt mystery and confusion surrounding two virus diseases (both involving the liver) are gradually being dissipated Infectious hepatitis (IH) and serum hepatitis (SH) differ in many respects including antigenic and immunologic differences [1] Infectious hepatitis has a shorter incubation period (18 to 40 days), it may become epidemic the virus may be recovered from the stool it can be modified or prevented by the use of gamma globulin, and, in those not completely protected, gamma globulin causes no prolongation of the incubation period

On the other hand, serum hepatitis (SH) has a longer period of incubation (60 to 150 days) and a lack of clear-cut epidemics, SH virus has not been recovered from the stool protection by the use of gamma globulin is uncertain, and, in those not completely protected, gamma globulin causes prolongation of the incubation period In experimental studies in a group of volunteers, the batches of gamma globulin tested did not contain neutralizing or inhibiting factors effective against the strain of serum hepatitis virus used

In quest of a means more reliable than gamma globulin for the prevention of serum hepatitis (SH), Blanchard *et al* succeeded in rendering icterogenic serum and plasma safe for administration by ex-

[1] Stokes, Joseph, Jr *et al.* J.A.M.A. 138 336 (Oct. 2) 1948.

posure to ultraviolet rays [2] Eleven volunteers showed no evidence of hepatitis following intramuscular injection of 7 cc of irradiated serum The period of observation was five months The incidence of hepatitis in a group of fifteen controls, each of whom received only 4 cc of nonirradiated icterogenic serum intramuscularly, was 47 per cent

For processing the icterogenic serum, the Habel-Sockrider type of apparatus was used Eighty-five per cent of its radiation was given off in the 2,537 angstrom unit wavelength The rate of flow was 24 cc per minute, and the time of exposure was ten seconds Irradiated plasma revealed no alteration of the electrophoretic pattern The plasma proteins were essentially normal There was a slight decrease in prothrombin and complement Irradiated serum produced no untoward reactions, and subsequent tests revealed no evidence of acquired sensitivity This clear-cut result strongly favors the routine use of exposure of serum and plasma to ultraviolet rays under properly standardized conditions

In Memoriam

James Alexander Miller, M D

Dr Miller was one of the founders of the Committee on Public Health Relations of the New York Academy of Medicine, which was organized on May 1, 1911 Although at the time he was one of the youngest, if not the youngest member of the Committee, he very soon became its directing genius More than any other single person, he helped to establish the Committee's course of action and to mold its policies His keen mind and clear vision, his tact, dignity, and judicial temperament, his high sense of reality, and his statesmanlike progressive attitude toward community requirements made him a peerless leader

He became chairman of the Committee in 1929, having acted temporarily in that capacity on many occasions during his predecessor's illness In 1936, upon election to the presidency of the Academy, Dr Miller resigned the chairmanship of the Committee but was persuaded to accept it again in 1942 during the war when the then chairman joined the armed forces Although suffering a great deal of physical pain during the last few years of his chairmanship, he kept a devoted interest in the work of the Committee, and, except for the last year, attended meetings regularly, although with much effort

During his continuous service on the Committee for thirty-seven years, Dr Miller exercised great influence on public opinion, on methods of procedure in public health and allied fields, and on the attitude of the medical profession toward many of the complicated problems that lie between clinical medicine and medical education, on the one hand, and community needs on the other In the course of his long public activity, he gained many devoted friends and followers, and he has left an indelible imprint on the annals of his time

The Committee herewith wishes to record with deep emotion its profound sorrow in the passing of its beloved leader, a great physician, a great humanitarian, and a great educator

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Diet Inventory Methods for Doctors, II

In the last issue the discussion of diet inventory methods considered the many sources from which information is obtained It was suggested that the physician use a card which acts as a reminder in history taking and also provides a permanent record

On this page an attempt is made to concentrate comment on the evaluation of data obtained at the interview The data usually having been obtained from a quick history, do not warrant more than qualitative treatment. Evaluation is most easily made by comparison with some arbitrary dietary pattern Such a diet pattern for adults is found in Table 1

TABLE 1.—DIETARY PATTERN FOR ADULTS (FOR COMPARISON PURPOSES)

Food Class	Amount per Day	Major Contributions
Milk or equivalent in cheese	2 or 3 cups	Calcium riboflavin protein some vitamin A
Meat, fish, poultry or dried legumes	1 to 2 servings	Protein, iron niacin some thiamin
Egg	1 per day or 3 to 4 per week	Protein iron some vitamin A and riboflavin
Fruits and vegetables, including Citrus fruit or tomato (twice as much)	4 to 5 servings (½ cup each)	
	1 serving	Ascorbic acid
Green leafy or yellow vegetable	1 serving	Provitamin A plus riboflavin and iron and calcium in green leafy vegetables
Whole grain and enriched cereals and breads	2 or more servings	B vitamins; some iron and protein
Butter or a fortified margarine	1 or more tablespoons daily	Fat and vitamin A
Additional food to maintain proper weight		

It takes judgment and knowledge of food values to use this scheme If the patient's intake is similar to Table 1, his nutrient intake will probably be adequate to meet the Food and Nutrition Board s recommended allowances The comparison will indicate the weak spots in food intake and may be used as the basis for recommendations to the patient The table cannot be used however, for foreign food patterns or for diets where large quantities of only a few foods are used that is a less varied diet The table reveals that calcium adequacy is largely dependent on milk and cheese intake To meet fully the new standards three cups of milk plus a good diet are necessary Many feel that the calcium in one pint of milk with a varied diet is adequate The Food and Nutrition Board s revised recommended allowances which show an increase for calcium may call for more than a pint of milk with a varied diet When viewing the normal intake pattern of the table one sees that vitamin A is supplied in a substantial quantity by carotene from a large daily serving of a green leafy or yellow vegetable Unless the serving of the latter is very large, an additional source of vitamin A such as whole milk or an egg or butter or fortified margarine, must be added each day The table points out that ascorbic acid is provided by a serving of citrus fruit or a double quantity of tomatoes. Other vegetables and fruits also contribute some ascorbic acid particularly if eaten raw In the table riboflavin is provided from three main sources namely milk, eggs and green leafy vegetables. About three cups of milk one egg and a serving of a green leafy vegetable are required daily Iron adequacy rests to a major extent on the red meat intake, with smaller but important contributions from eggs whole grain cereals potatoes, and green leafy vegetables Thiamin is the nutrient most difficult to evaluate by diet pattern It is present in only limited

quantities in a wide variety of foods A generally well-balanced diet with the use of enriched and whole grain cereals and breadstuff is probably the best source Calories can be judged on the basis of weight

In Table 2 one will find a convenient protein guide which may be used in evaluating data obtained for this important nutrient Protein adequacy in the diet is based largely on the consumption, in proper amounts, of meat or its substitutes and milk

TABLE 2 —SCHEME FOR PROVIDING PROTEIN FOR A DAY (60-70 GM) FOR AN ADULT

Food	Amount	Gm of Protein
Meat fish or poultry	4 oz serving	20
Milk	1 pint	17
Meat substitute as	1/4 cup cottage cheese or 1/2 cup cooked dried legumes	10
Egg	1	6 5
Whole grain cereal or bread	3 servings	7 5
Potato	1 medium	3
Green leafy or yellow vegetable	1 serving	2
Citrus fruit	1 serving	1
Other fruits and vegetables	2 servings	2
		69

The best practice for the physician to follow is to record his dietary impressions at the time of evaluation and also to record the recommendations which he makes This record forms a basis for checking progress quickly on return visits

For comparison with clinical or laboratory findings, one may require a quantitative evaluation of the diet in terms of specific nutrients The need for such an evaluation must be known before the history is taken, for in this event careful inquiry should have been made regarding quantities of intake It must be realized that at best these figures are not accurate For purposes of calculation, the two most easily used and inexpensive tables available are the new U S P H S "Food Value Tables for the Calculation of Diet Records" and the sixth edition of *Food Values of Portions Commonly Used*, by Bowes and Church [1 2] In addition several "short" methods of dietary analysis are available In these various methods of analysis, foods of similar composition are grouped together, and weighted mean values are given for each of the nutrients The best known of these is the one by Donelson and Leichsenring [3] It is published in Turner's *Handbook of Diet Therapy*, the accepted manual of the American Dietetic Association, other short methods include those of Berryman and Steinkamp [4]

THE FEMALE PERINEUM ITS STRUCTURE, FUNCTION, AND PRESERVATION

RAYMOND J PIERI, M D and FRANK C MEYER, M D Syracuse, New York

(From the Department of Obstetrics Syracuse University College of Medicine)

OBSTETRICIANS and gynecologists no longer allude to the female perineum as the area between the vagina and anus The term "perineum" is accurately employed to denote all those soft parts both muscle and fascia which correspond to the inferior aperture or outlet of the bony pelvis In addition to that important wedge-shaped structure which anatomically is called the perineal body the term also includes those structures of equal or greater importance which are found in both the anterior and posterior triangles of the pelvic outlet

Childbirth is usually considered a normal process. Yet in nearly every delivery the tissues of the female perineum are subjected to variable degrees of trauma, which lead to impairment of their function and invite subsequent invalidism of the mother

The purpose of this presentation is twofold—to emphasize the functions of these structures, especially during labor, and to plead the importance of their obstetric preservation. This necessitates first a consideration of their structural or anatomic relationships

Structure

The outlet of the bony pelvis, seen from below, presents two commonly recognized landmarks, the ischial tuberosities Between their widest points an imaginary line corresponds to the bisischial diameter of the outlet and forms the common base of two triangles. The bisischial line traverses the perineum just anterior to the anus The apex of the anterior, or urogenital triangle is the subpubic ligament while the apex of the posterior or rectal triangle is the sacrococcygeal joint

The relations between these landmarks and the female perineum can best be perceived by visualizing the bony outlet in the human figure The external genitalia occupy the anterior triangle while the anal orifice appears in the posterior triangle

Removal of the skin and superficial fascia of both triangles reveals that the bisischial diameter AB corresponds somewhat closely with an anatomic division between the anterior (urogenital) triangle and the posterior (rectal) triangle (Fig 1) In the anterior triangle a rather dense layer of the deep superficial fascia (Colles' fascia) is encountered Along line AB this fuses with the posterior limits of a deeper, double plane of fascia, the so-called triangular ligament (or urogenital diaphragm)

In the posterior triangle there is first a layer of superficial fat Removal of this discloses the ischiorectal fossae the external rectal sphincter the anococcygeal body, and the anal fascia. The anal fascia covers the inferior aspect of the levator muscles (pelvic diaphragm)

Careful dissection of the anterior triangle shows it to be composed of two flat compartments on each side of the midline (vagina) The most

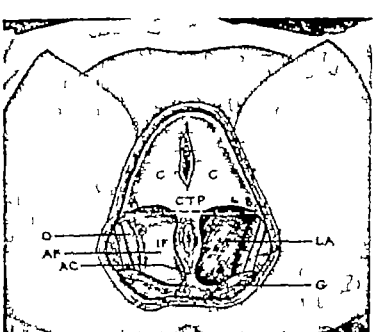

FIG 1.

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Obstetrics and Gynecology May 20 1948.

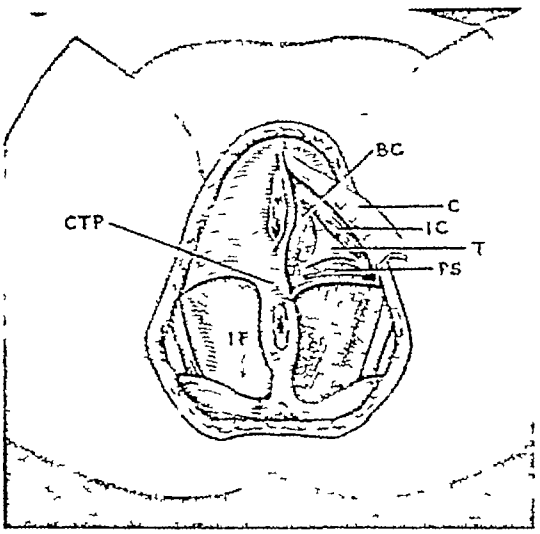

FIG 2

superficial (inferior) of these is opened by reflecting Colles fascia laterally (Fig 2) This exposes its contents, the ischiocavernosus, the bulbocavernosus (constrictor cunni), and the superficial transverse perineal muscles Medially, the latter two contribute fibers to the central tendon of the perineum, or perineal body

The "roof" of the superficial compartment is discerned as the inferior of two flat layers of thin fascia (triangular ligament urogenital diaphragm, or urogenital trigon) which enclose the so-called "deep" compartment Thus, the roof of the superficial compartment forms also the "floor" of the deep compartment Removal of the structures of the superficial compartment and opening the inferior (floor) of the two fascial layers of the urogenital diaphragm reveals the contents of the deep compartment interposed between them (Fig 3) Two muscles may be identified here, the sphincter muscle of the membranous urethra and the deep transverse perineal muscle The latter muscle is also inserted medially into the perineal body As previously indicated, the roof of the deep perineal compartment is the superior of the two fascial layers of the urogenital diaphragm Posteriorly, along the bisischial line, they fuse with each other and with Colles' fascia

The ischiorectal fossae thus potentially extend from the posterior triangle anteriorly between the superior fascia of the urogenital triangle and the inferior levator (anal) fascia (Fig 3) Actually, however, these fossae do not extend forward beyond the bisischial line

The anal fascia invests the inferior surface of the paired levator ani muscles The superior surface of the levators is likewise covered by fascia These two fascial layers collectively are referred to as the pelvic fascia The levatores ani form the pelvic diaphragm

Removing the various structures of which the urogenital diaphragm is composed and dissecting the anal fascia off the inferior surface of the levatores ani reveals this most important paired muscle, the pelvic diaphragm (Fig 4) Anatomically two parts of each levator are recognized The medial portion (pubococcygeus) passes backward from its pubic origin lateral to the vagina Some fibers mingle with longitudinal fibers of the vaginal wall and with the bulbocavernosus muscle Others decussate in the perineal body The main portion proceeds to mingle somewhat with the external sphincter, but chiefly with the anococcygeal body itself

The lateral portion (iococcygeus) of the levator arises from the "white line" of the tendinous

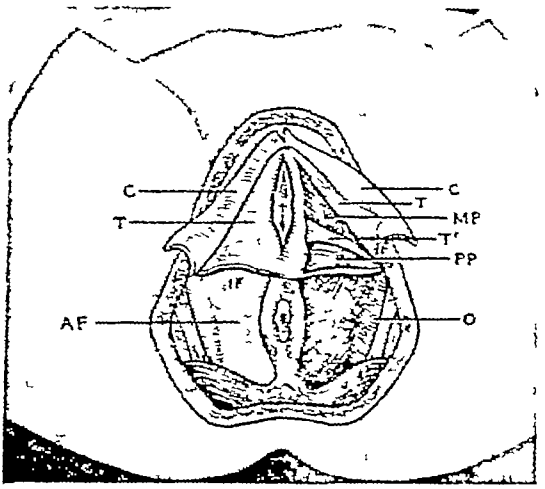

FIG 3

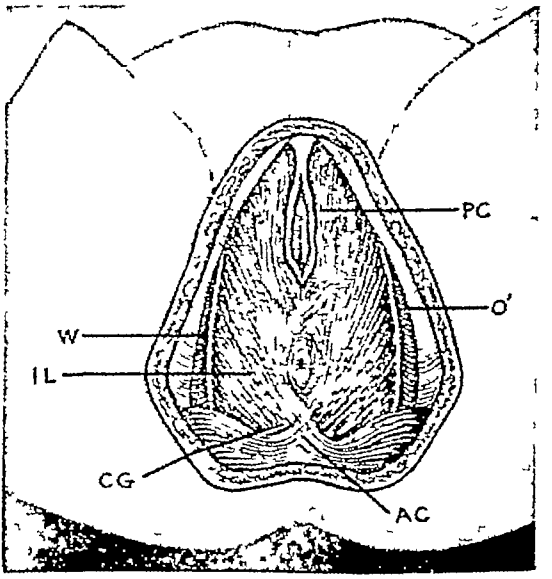

FIG 4

arch (see below) Most of these fibers pass downward and backward Some join their homologues of the opposite side in the obstetric perineum, others terminate in the anococcygeal body, and still others insert into the lateral margins of the coccyx. More posterior to the levator fibers the coccygeus and pyriformis muscles complete the closure of the aperture of the pelvic outlet

The pelvic floor thus resembles a trough with a V-shaped conformation, sloping downward and forward from its closed beginning (anococcygeal body) to its anterior opening (vagina) Aside from the primary function of support to the pelvic viscera this arrangement of the soft tissues (fascia and muscle) of the female perineum is of vast importance in the mechanism of labor When the pelvic floor is seen from above, it becomes manifest how, during childbirth, the presenting part is guided through the birth canal along the line of least resistance via the vagina and pelvic outlet into the outside world

Laterally, on each side of the levators, both superior and inferior layers of the pelvic fascia (levator fascia) fuse with each other and with the fascia covering the inner surface of the obturator internus The ridge thus formed is the arcus tendineous of the levatores ani, called by anatomists the 'white line' because of its unmistakable appearance. The white line of fascia extends posteriorly and downward on each side to the ischial spines, where it terminates about 5 cm below the plane of the pelvic inlet

Slightly below and medial to the white line the superior levator fascia thickens to form a band like base or ridge of fascia, the tela endopelvina, or main sheet of visceral fascia, which gives off four main layers One layer invests the bladder a second lies between bladder and the noncontractile segment of the uterus above, and between bladder and vagina below A third layer lies between vagina and rectum, while the fourth is posterior to the rectum

Function

The proper support and normal function of the pelvic viscera depend upon the integrity of their respective fascial investments All skeletal muscles are likewise sheathed in fibro-elastic tissue (fascia) Normal elasticity exists only within certain limits. Any such structure which sustains damage to its fascial support soon weakens In the case of a muscle the unsupported fibers become separated, and the muscle herniates Just as the body depends upon the integrity of the bony skeleton for support so do all skeletal muscles and most viscera depend upon the integrity of their fasciae.

During late pregnancy, through hormonal and vascular influences the entire perineum projects several centimeters below its level in the nonpregnant state While there is also a general increase in soft-part elasticity, this is seldom sufficient to allow the birth of a full term infant without some structural damage accompanying the accidents and trauma associated with delivery

With the onset of labor the powers of the uteroabdominal contractions are expended chiefly in dilating and stretching both fascia and muscle. The infant is forced like a wedge through three main levels of resistance, the cervix the levatores (posterior or anal triangle) and the structures of the urogenital triangle There results a profound stretching and distortion of the birth canal Lacerations are common accidents

The anatomic sequelae of these accidents are loss of visceral support, descensus, sagging of the bladder and urethra, cystocele and rectocele and gaping of the orifices of both triangles. Most of these result from single or multiple tears in one or more of the various layers of muscle or fascia Even overstretching beyond the normal elasticity predisposes to later loss of support Often the damage is recognized in the form of visible tears but not infrequently, it is concealed beneath an apparently intact vaginal mucosa which is noted for its redundance

Preservation

Most of the tears of soft tissues occur late in the second stage of labor after the presenting part has reached the pelvic floor Episiotomy properly timed and executed, usually creates sufficient additional space to prevent most lacerations of the perineum It has for its objectives the relief of excessive strain upon the structures of both triangles the substitution of a clean incision for ragged tears during delivery and, following childbirth, the preservation of structure by a neat repair

Episiotomy is not an innovation. It was performed by Ould in 1742 Many teachers have since observed its indications and contraindications but the minutiae of anatomy and technic have for the most part been disregarded

Normally delivery is not attempted until the presenting part is on the levators, with evidence of pressure (bulging) on the perineum, accompanied by distortion of the anus and the appearance of 'caput' Following the usual preparation for delivery the bladder is catheterized and the perineum gently 'ironed out' manually accompanied by the liberal use of neutral liquid soap It is important to avoid overstretching. This causes future loss of muscle tone and damage to fascia It is likewise important to avoid too rapid manual dilatation This favors laceration

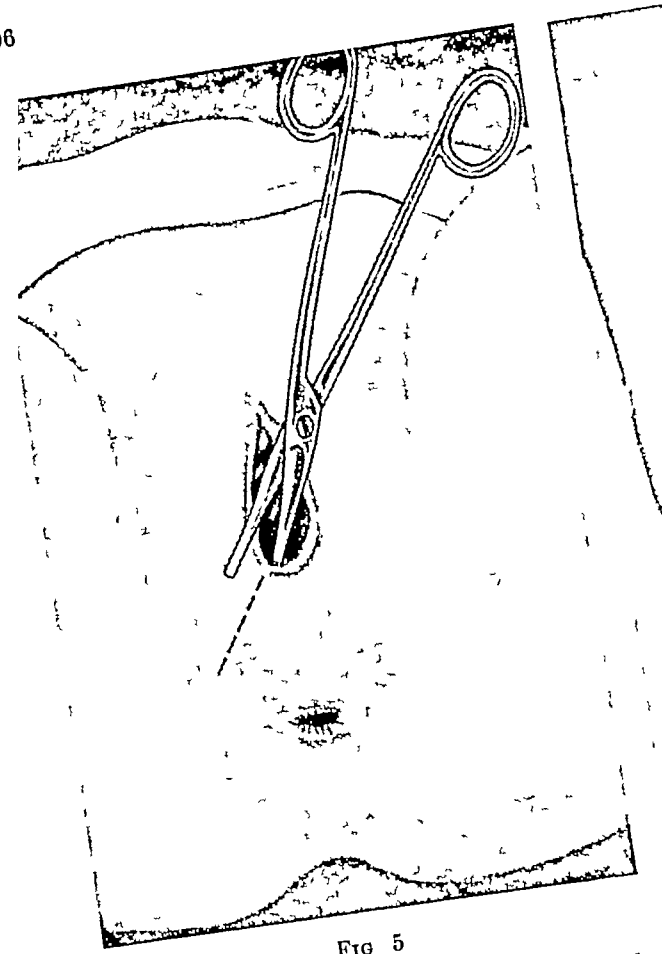

FIG 5

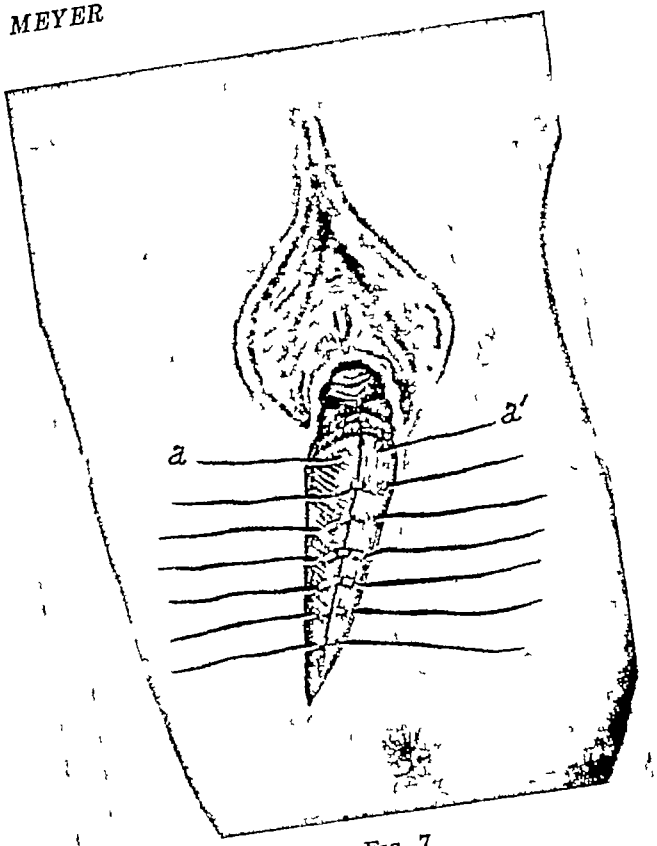

FIG 7

The site of incision is usually mediolateral, right or left, chiefly because accidental extension of the cut in either case avoids the sphincter Sharp scissors are necessary (Fig 5)

The length of the incision determines which structures are severed by the episiotomy At times, in pathologic cases, even the ischiorectal fossa may be involved Ordinarily, however, one severs the vaginal mucosa, skin, Colles' fascia, the bulbocavernosus, the transversus perinei, the urogenital septum, and the median fibers of the pubococcygens portion of the levator (Fig 6) Following delivery, any persistent bleeding from severed vessels is controlled with Allis clamps No attempt at suturing is advised until the placenta is delivered, after which a vaginal pack is inserted to keep the field clear during the repair

Ordinarily, inspection of the incision does not reveal details of individual anatomic structures, except for muscle tissue and Colles' fascia (Fig 7) The latter is usually found retracted under the integument and superficial panniculus

The following technic of repair avoids the passing of sutures through either mucosa or skin All sutures are fine chromic catgut, number 000, tied only securely enough to secure coaptation The first stitch, aa', is submucous and is passed widely around the upper angle of the incision (Fig 7) This is to bring together any fibers of muscle or fascia which may have become invisibly separated beneath the mucosa Neglecting to observe this precaution favors subsequent rectocele if such an occult separation exists The first layer consists of interrupted sutures (Fig 8) Allis clamps are used as retractors

The second layer of sutures includes Colles' fascia and is likewise interrupted Its important feature is the "crown stitch" This coaptates the retracted ends of the severed bulbocavernosus

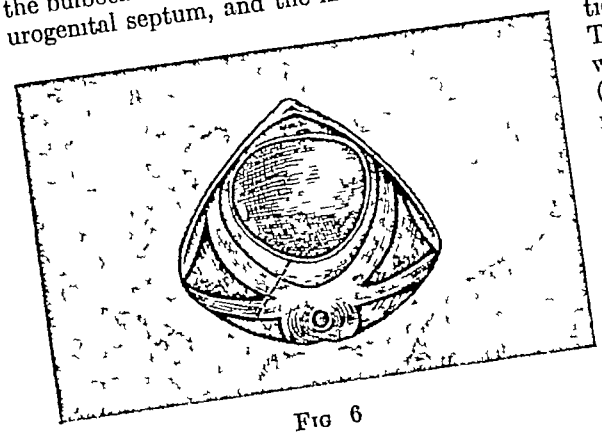

FIG 6

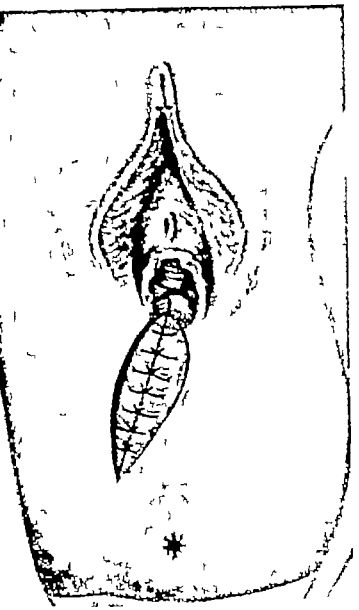

FIG 8

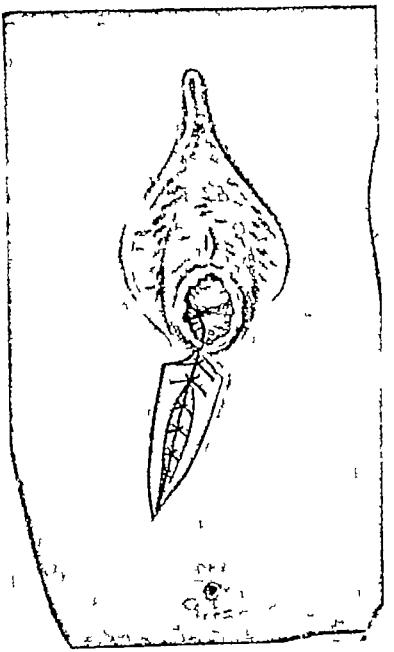

FIG 9

nuscle and restores the hymeneal ring (Fig 9) To accomplish this the needle must be inserted obliquely upward in the base of the labia minora in order to grasp the constrictor fibers. In some cases, to prevent gaping of the vagina two such sutures may be required

The skin is closed by a continuous subcuticular suture on a fine needle beginning at the lower angle of the cut (Fig. 10) As the integument is thus coaptated Allis clamps are applied gently to its everted edges (Fig 11) A dozen such clamps are ready for use in each case These are permitted to remain clamped for only a few moments during which the vaginal pack is removed any clots expressed, and preparations made for transfer of the patient to her bed

Apposition of the cut edges of the skin in this manner makes adherence quite effective, results in a fine linear scar, and seems to reduce appreciably the degree of postoperative discomfort (Fig 12) Routine perineal care is exercised following delivery Early ambulation is encouraged Hospitalization of normal patients postpartum averages seven days *

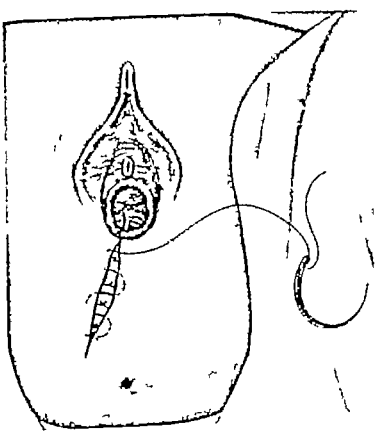

FIG 10

* Routine of the obstetric division of the Medical Center Syracuse University

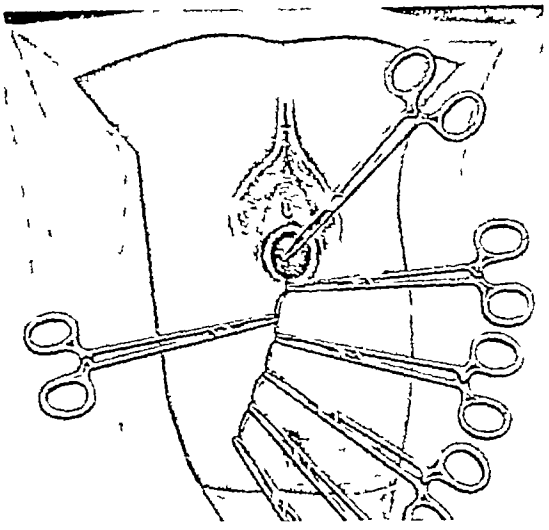

FIG 11

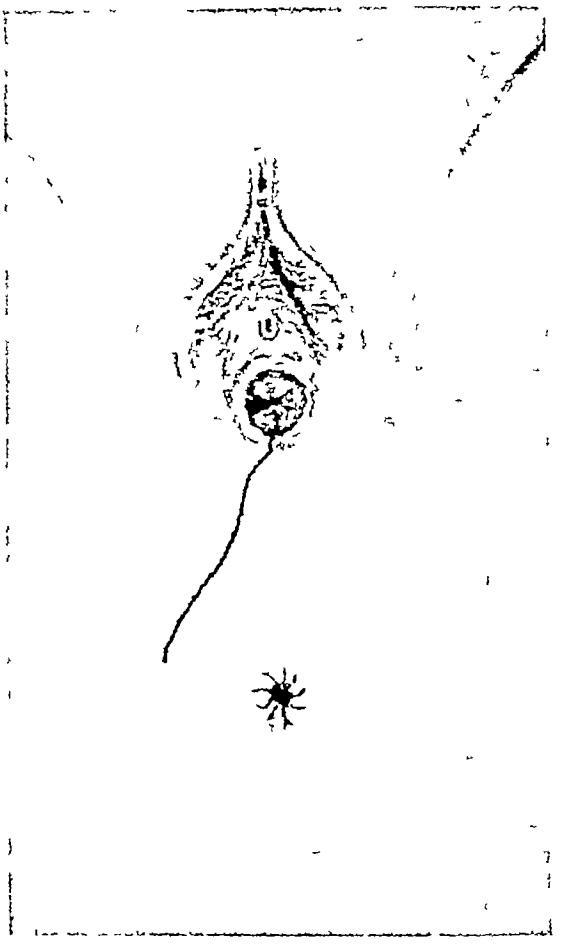

FIG 12.

Summary

A review of the structure of the female perineum is presented to assist the obstetric attendant in an understanding of its importance A brief outline of the function of these parts is included It is emphasized that nearly every delivery is accompanied by trauma and often followed by permanent damage Episiotomy is suggested as a means of avoiding most of the severe lacerations of the perineal structures A simple and effective technic of repair is included

Discussion

W D George, M D , *Watertown* —There is no question but what mediolateral episiotomy is much the safer in most cases, because of less danger to the sphincter ani, and will usually leave the patient with as good a perineum as she had before her pregnancy

Occasionally, we see a patient in her first pregnancy with no tone to her ligaments or musculature, in early pregnancy the uterus may be prolapsed to the introitus Such a patient, even with a well-executed and well-repaired episiotomy, will still have her prolapsus and a poor perineum However, fortunately, these cases are exceptional

Dr Pieri says "no attempt at suturing is advised until the placenta is delivered," and with the use of present oxytocics, the placenta does deliver promptly However, in perhaps 5 per cent of the cases where this does not occur and where there is no excess bleeding requiring manual removal of the placenta, I see no objection in going ahead with the repair of the episiotomy Membranes hanging over the external perineal skin should be trimmed off and the remainder held above the episiotomy incision by a vaginal pack If the placenta seems to be separated at any time during the repair, it may be delivered promptly

I prefer number 0 chromic catgut rather than 000 chromic However, I do not doubt but what Dr Pieri gets excellent repair with his lighter catgut

Raymond L Rhodes, M.D , *Glens Falls* —This paper gives an excellent summary of the anatomic structure and the resulting physiologic functioning of the female perineum at childbirth Many obstetricians in the past either did not realize the importance of perineal preservation to the patient in later years or else chose to ignore this factor In more recent years, however, the trend of care of the woman at parturition has swung from the theory of allowing nature to take its course with repair of only visible tears to a more logical method of assisting and abetting nature during this normal process, with the routine use of episiotomies Once again the use of this surgical procedure is of very little aid unless the anatomic structures of the female perineum are understood, in order that proper re-approximation of said structures in their normal relationship can be carried out

It is the feeling of Dr Pieri, as it is of most obstetricians, that a happy medium should be reached on the stretching of the pelvic hammock The allowing of the baby's head or rump, whichever dilating

wedge may be presenting, to reach the pelvic floor and cause the structures to stretch is the point where obstetric interference can do much to prevent ir repairable damage There is no doubt that at this point the use of low prophylactic forceps plus an episiotomy, not only preserves and protects the fascial supports and the muscular attachments from multiple unrepairable tears but likewise does much to prevent trauma to the baby s head.

The repair of this episiotomy is important other wise the obstetrician has lost the benefits for which it was performed If the levator muscles and fascial supports are not re-approximated, including the sphincter ani (bulbo cavernosus) a relaxed perineum may result with the common rectocele oc curring in later years. An interesting study along this same line of thought would be to make a detailed report on vaginal plastics of the past year versus twenty years ago in regard to age number of babies, forcep deliveries and routine episiotomies Maybe this work has been done, but I have never happened to see the report It is my impression that there are fewer vaginal repairs being done today than ten or fifteen years ago

The early ambulation (twenty four to forty-eight hours postpartum) of patients as practiced in many clinics, does not fit into my understanding of the physiology of the parturient patient Knowing that the pelvic structures are relaxed for delivery of a baby it is questionable in my mind whether too early ambulation is wise The weight of the abdominal contents, including the parturient uterus is thrown on the already relaxed structures and it seems as though further permanent stretching would occur I do not feel the same about early convalescence of surgical cases where the tissues are normal in tone Dr Pieri s practice averages seven days for convalescing postpartum cases I have followed the routine of having the patients ambulatory on the seventh day and home on the eighth day I do feel that these same patients should be encouraged with exercises in bed to avoid the surgical complications for which we advocate early ambulation of laparot omies

---

PRIZE ESSAYS

The Merrit H. Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 2, 1949 in Buffalo

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York

The Merrit H Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State.

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device. The essay shall be accompanied by a sealed envelope hav ing on the outside the same motto or device, and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of a prize it will not be awarded

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct."

All essays must be presented not later than February 1, 1949 and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York.

ARMITAGE WHITMAN, M D , *Chairman*
Committee on Prize Essays

SOME ASSOCIATED EYE AND SKIN MANIFESTATIONS OF SYSTEMIC DISEASE

ISADORE GIVNER, M D , F A C S , New York City

(From the Departments of Ophthalmology of New York University, College of Medicine, and Bellevue Hospital)

COOPERATION between ophthalmologists and specialists in other branches of medicine is still essential to unravel the heterogeneous picture of disease with symptoms originating in different parts of the body Changes which were previously regarded as separate diseases have in many cases been found to be only symptoms or combinations of symptoms of general affection In some cases the embryologic similarity in origin—namely, the ectoderm—and, in other cases, involvement of the vascular system or the bringing of toxic agents of systemic nature to both the eye and skin make for the simultaneous appearance of lesions in both as manifestations of general disease

A complete and comprehensive discussion of all known conditions with both eye and skin expressions would necessitate more time than a short paper allows At this time, since only a few diseases can be mentioned, those conditions where a new thought can be introduced will be given preference

Phakomatoses (Van der Hoeve)

Bourneville's Disease—In 1880 Bourneville showed that tuberous sclerosis of the central nervous system leads to mental deficiency and epilepsy [1] That the changes are associated with sebaceous adenoma of the skin was demonstrated by Pelagatti in 1904 and Vogt in 1908 [2] The sebaceous adenoma (Pringle's Disease, 1890) appears as grain-sized, usually brownish-red papules, forming a butterfly-like pattern on the nose and cheeks [3] The histologic picture varies with the amount of adipose tissue and connective tissue In 1921 Van der Hoeve showed that retinal tumors, grayish-white or glossy white, often raspberry-like in form due to papillomatous excrescence, may occur [4] Histologically, the cerebral and retinal changes consist of gliosis and ill-differentiated large glial or ganglion cells and fibrils Cysts in the tumors are seen, and Van der Hoeve records one case in which such a cyst ruptured and probably implanted itself elsewhere in the retina He also notes a case that had one tumor in each eye Fifteen years later a highly calcified tumor and many additional tumors were noted

A case that I have observed since he was eight months old, when a diagnosis was made from the fundus appearance and confirmed by encephalogram, showed not only an increase in the number of retinal tumors of one eye but a transition of the cystlike growth of the optic disk of the opposite eye into the classic mulberry appearance gradually evolved by the impregnation of calcium (Fig 1) The patient is now eight years old

Recklinghausen's Disease (Neurofibromatosis) [5] —The skin lesions, molluscum fibrosum, consist of multiple flat or pedunculated, occasionally elephantiasic, tumors Moles and café au lait spots occur Elephantiasis of the eyelids may appear shortly after birth Neurinomatous changes occur in the ciliary nerves, sclera, cornea, uvea, and optic nerve Melanotic nodules may occur in the iris There is bone involvement in 70 per cent of the cases

A case with absence of the roof of the orbit due to a complete absence of both the greater and lesser wing of the sphenoid on the left side, as verified finally at autopsy, was followed for many years The pulsating exophthalmus present and the muscle paralysis seen have been described previously However, an attempt to study oscillatory tracings accompanying increased intracranial pressure, as occurs in deep respiration and coughing, was carried out and easily demonstrated these changes graphically (Fig 2)

Sturge-Weber's Disease—In 1879 Sturge showed that angiomatous changes can give rise to the simultaneous appearance of a nevus flammeus of the skin, glaucoma or buphthalmus, and epilepsy [6] In 1922 Weber demonstrated roentgenologically the presence of characteristic calcareous shadows in the brain in cases of this disease [7] Not only are angiomata of the choroid seen on the side of the angioma of the skin of the face, but studies with fluorescein indicate increased capillary permeability in the involved eye

Amino Acid Deficiencies

In studying the effect on the eye of individual amino acid deficiencies, it was found that valine produced a corneal dystrophy This change was reversible and disappeared after the administration of valine Two cases of exfoliative dermatitis with corneal changes similar to those seen in valine deficiency were observed At that time,

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City, Section on Ophthalmology and Otolaryngology, May 20 1948

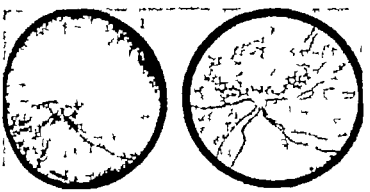

FIG. 1 Fundus picture seen at the age of eight months (left) and eight years (right)

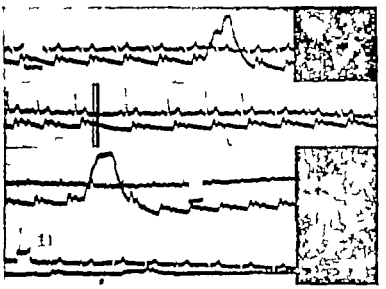

FIG 2. Graphic representation of pulsating exophthalmos at periods of increased intracranial pressure—*1*, effect of cough, *2*, effect of inspiration and expiration *3* effect of cough *1, 2 3*, on abnormal left eye, and *10* effect of cough on right extraocular pressure.

methods of determination of individual amino acid deficiency were not available Subsequent to the parenteral administration of amino acids, aminoids by mouth, and a high protein diet however the cornea began to clear and eventuated in complete clearing with restoration of 20/20 vision from 20/100 in the right eye and 20/40 in the left eye in one case In the second case, vision returned to normal from 20/50 in both eyes In both cases the total proteins were reduced, showing predominantly in the albumin fraction (total protein 4 9—albumin 2 9 globulin 2)

Acute Disseminated Lupus Erythematosus

Before this clinical syndrome is sufficiently well developed to permit diagnosis a fundus examination may lead the internist to the correct diagnosis Wagener has stated It seems possible that from more universal studies of the retina in these cases, a reasonably characteristic picture might evolve In my experience the toxic retinopathy is most frequently encountered Gross involvement of the retinal vessels is much less common.[7 8] Keil advanced the vascular concept of the disease.[9] He assumed the presence of a theoretic toxin that has a selective affinity for the vascular system, chiefly the capillaries Pathologically a peculiar hyaline thickening (wire loop) of the walls of the glomerular capillaries occurs Renal involvement occurs in practically every case.

In those cases where the retina showed involvement, the presence of some form of exudate was regularly found Prominently mentioned were cotton wool patches Kurz in 1938 was the first to demonstrate the true histology of the white patches in the retina namely varicosities of the nerve fiber layer.[10] He thought the lesions were identical with retinitis septica of Roth and considered them to be toxic in origin Maumenee confirmed the histologic findings in five cases of his own.[11]

In three cases that I have observed, the striate appearance of the exudates indicating the nerve fiber localization has been sufficiently impressive to lend diagnostic import in a less developed and less definite case Whereas the diagnosis depends chiefly on the cutaneous lesions occasionally no cutaneous lesions may be present.

Case 1—Such a case is M F a man aged thirty three (This fact is also unusual) His original complaint was of disturbance of vision and edema of the bulbar conjunctiva The symptoms had come on after being in the sun in Florida. He subsequently developed loss of appetite, nausea, and low grade fever followed by pronounced ascites hydrothorax and marked fluid accumulation in the pericardium His physician suspected acute lupus erythematosus and referred the patient for a fundus study Both retinas were filled with many exudates each of which had a striation, diagnostic of a nerve fiber localization With no attenuation of the retinal arterioles, only moderate kidney involvement and the above clinical picture it was my opinion that the fundus picture was compatible with and suggestive of lupus erythematosus. The latter diagnosis was confirmed by consultations. Eight months later a rash appeared on the cheek that the skin consultants felt was what we would expect in lupus erythematosus.

Although this case has not been confirmed by biopsy or autopsy the importance of fundus studies is stressed Other cases that have come to autopsy emphasize the need for bearing this diagnosis in mind when striate exudates in a patient with no hypertension or vessel attenuation are observed in a case of continued fever The aggravation of skin lesions by sunlight and sulfonamides lends further information leading to the diagnosis of acute lupus erythematosus.

Boeck's Sarcoid

This is a chronic, relatively benign disorder of unknown cause with particular predilection for the lymphatic tissue or the reticuloendothelial system The term sarcoid was adopted by Boeck in 1899 for lesions simulating sarcomas and leukemic conditions of the skin [12] He believed the condition to be one only of the skin Later he recognized his error The two main types of cutaneous lesions associated with the disease, the superficial and the deep, have a predilection for the face, the external surfaces of the arms, and the shoulders and the trunk, but may be found in other areas The superficial lesions are papular and nodular elevations varying in size from that of a pinhead to that of a pea They are sharply outlined, dark red, and may be surrounded by adherent scales The larger lesions are subcutaneous and nodular and have either faint or no surrounding erythema The eye is one of the favorite sites of the disease, and many patients first consult the ophthalmologist The most frequent lesion is an inflammation of the anterior portion of the uveal tract

Osseous changes in the hands and feet, disclosed on roentgen study, are practically pathognomonic A characteristic histologic picture, consisting of naked tubercles, collections of epithelioid cells interspersed with lymphocytes and occasional giant cells without caseation necrosis and tubercle bacilli, is found uniformly in every involved structure

Boeck's sarcoid is one of the possible causes of the Mickulicz syndrome, with involvement of the lacrimal glands and at times the salivary glands

Case 2 —A A , a Negro woman, age thirty-five, was seen at New York Post-Graduate Hospital Her chief complaint was generalized small nodules in the scalp Soon other nodules appeared in the upper lid, lower lip, and other parts of the body, varying from 1 to 4 mm in size and noninflammatory in type There was a diffuse swelling of the parotid glands and an enlargement of the palpebral portion of both lacrimal glands The orbital portion on the left side had a shotty feeling On everting the upper lid, a hyaline-like excrescence at the upper border of the tarsus could be seen The remainder of the ophthalmologic examination was negative General examination was negative except for an enlargement of the liver Tuberculin tests up to 1 100 mg (old tuberculin) were negative An x-ray of the chest showed diffuse reticular and miliary infiltration of the central lung fields, mainly toward the bases The heads of the several phalanges of both hands showed small cystic-like areas Biopsy of a nodule from the left forearm showed masses composed of epithelioid and giant cells No caseation and very little round cell infiltration was present

The importance of biopsy in suspected cases is emphasized

The argument as to whether the disease is really tuberculosis has not been decided Tubercle bacilli have been reported in cutaneous lesions, and at necropsy fresh tuberculosis processes have been found [13] Although this has not been the experience of the majority of investigators, the trend today is not to deny the possibility of sarcoid being a form of tuberculosis Leitner in 1946 reported eight cases of Boeck's sarcoid [14] In three of these there was a transition from benign granulomatosis to tuberculosis, and in four cases a negative tuberculin became positive The similarity between the clinical symptoms and the course of benign granulomatosis in a brother and sister suggests that the constitution plays an important part in the course of Boeck's disease The tuberculin test was slightly positive in the sister and negative in the brother The tuberculin reaction is to be considered, says Leitner, as an antigen-antibody reaction The negative tuberculin test may be the result of the fixation of the antibodies at the site of their production (the reticuloendothelial system) by the antigens of the Koch bacillus which are destroyed at the same site

Case 3 —E R , a fifteen-year-old white boy, complained of a lump on his left upper lid On everting the lid, a granulomatous pedunculated growth with a broad based pedicle was seen The left preauricular gland was enlarged His Mantoux reaction, 1 100,000, was positive Biopsy confirmed the diagnosis of sarcoid

A positive tuberculin does not exclude sarcoid but is in keeping with a trend of one school of thought—that of considering sarcoid a special type of tuberculosis

Recurrent Aphthous Uveitis with Mucocutaneous Lesions

This syndrome is characterized by periodically recurring uveitis and a group of mucous and cutaneous symptoms, namely, cutaneous eruptions of various types and aphthae and ulceration of the buccal and genital mucous membranes This disease seems to have been described as far back as 1772 by Janin de Combe Blanche, the French oculist [15] Behcet excluded the recurrent iritis and hypopyon and has described cases in which the conjuctiva was affected but no uveitis occurred (the so-called triple symptom complex) [16]

In such cases Francheschetti believes the disease is in an attenuated form [17]

The disease affects young people of both sexes The attacks are recurrent and periodic The lesions usually involve the skin or mucous membranes and later the ocular tissues Buccal

aphthae with or without submaxillary enlargement of the lymph nodes, recurrent aphthae on the genitalia or ulcerations on the scrotum and balanopreputial groove, sometimes accompanied by nonspecific urethritis, completes the picture The cutaneous lesions appear as erythema nodosum papulopustular erythema or pyoderma gangrenosum

The possibility of a virus infection has been considered but not yet proved

Urbanek felt the condition represented a hypersensitiveness to foreign proteins.[18] This condition is related to the pluriorificial ectodermosis of Fressinger and Rendu known in this country as Steven-Johnson disease in which our chairman called attention to the eye findings noted in erythema multiforme The similarities are as follows (1) cutaneous eruptions of the polymorphous type of erythema with aphthous stomatitis of an acute evolution in which the conjunctiva and cornea are involved and uveitis does not occur, and (2) generalized allergic reaction

Both diseases are not identical but there are similarities Whereas no one cause of these conditions has been definitely ascertained, in three cases of my own and a review of the literature where bacteriologic notations have been made of the conjunctival and intraocular flora after infection, only Staphylococcus aureus has been noted It is probably the reduced vitality of the tissues that allow this commonly present organism to attack both the eye and the skin as cultures of vesicles of the skin have also shown the constantly present S aureus to be the only cultivable bacteria. On occasion, however inclusion bodies have been recovered from the skin vesicles stained with victoria blue, especially by Thygeson.

Vogt Koyanagi Disease

The association of poliosis with an inflammatory change in the eyes, namely, sympathetic ophthalmia was first noted in 1873 by Schenkel [19] Hutchinson, twenty years later was the first to describe poliosis with bilateral iridocyclitis When there is a change in the air content, the whitening of the lashes may be sudden, and this fact explains the occurrence of canities overnight In such instances there is a complete absence of pigment in the hair shaft When a disturbance of pigment occurs less rapidly, the color is less distinctly white and a few granules may be seen between the cells of the hair shaft

Alopecia occurs in 53 per cent of cases, poliosis in 82 per cent vitiligo in 62 per cent, and dysacousia in 50 per cent of cases. Some observers conclude that nontraumatic bilateral uveitis accompanied by one or all of these symptoms should be regarded as Vogt-Koyanagi syndrome Duke-Elder states that Harada's disease in which one has a spontaneous bilateral retinal detachment which reattaches itself represents a milder form of the Vogt Koyanagi syndrome.[9]

Cutaneous testing with pigment shows a positive reaction similar to that seen in sympathetic ophthalmia in about one third of the cases All cases reported have been darkly pigmented individuals frequently Japanese and Italians

Case 4—E F, when first seen had faulty light projection in each eye His history told of bilateral uveitis of two years duration followed by complicating cataract and plastic iritis An interesting symptom was 'double hearing' and dizziness Three weeks following this alopecia occurred followed by canities and poliosis

Case 5—The case of F M a thirty year-old man ran the classic course of Harada's disease with bilateral retinal detachment which attached itself and bilateral uveitis with secondary glaucoma followed by poliosis. One eye fortunately retains normal vision after surgery and the second eye 20/100 vision with normal tension in each eye

Melanoma of the Skin with Intraocular and Orbital Metastases

It has been stated by Virchow that organs which are a frequent site of origin of primary cancer are prone not to have metastatic growths Although there are many exceptions to this statement, the rule seems to apply with peculiar force to the melanotic malignant growths of the eye Most of the melanomas of this organ are known to be primary in the choroid Only a few have been reported as metastasizing to the eye from other sites of origin. I have recently collected seven cases, including one of my own, which in a melanotic tumor arising in the skin produced intraocular metastases This patient gave a history of a painful "strawberry" mass appearing in the skin of the right posterior wall of the chest two years previously [21] The growth was excised surgically The patient remained in good health for eighteen months. Then, at the site of the previous operation another mass appeared followed by swelling in the axilla. Histologic examination showed metastatic malignant melanoma of the lymphatic nodes As part of a generalized metastasis the eye showed lesions in the iris ciliary body choroid, and orbit.

We concluded that although most melanotic tumors of the eye are primary the possibility should be borne in mind that they can be second ary and careful search made for other primary sites and evidence of multiple metastases.

Monocytic Leukemia

Three cases of monocytic leukemia were observed In each case the fundus showed preretinal hemorrhages associated with a low platelet count In one case hemorrhages from the nose and ears occurred as well as in the brain, the latter producing a papilledema At autopsy the posterior segments of the globes were obtained and showed the preretinal hemorrhages as well as the vessels filled with monocytes The possibility of this type of leukemia should be borne in mind with this type of hemorrhage in a case of leukemia

In the skin an eczema-like eruption may be the first symptom to which the patient's attention is called (Leukemia cutis) Occasionally, small tumors occur in the skin In some instances diffuse lymphatic hypertrophy with the formation in the lower part of the corium or subcutaneously of discrete or chainlike pea- to cherry-sized or larger, flattened nodules, occasionally resembling mycosis fungoides, occurs

Brucellosis

This is a disease of manifold symptoms The eye is one of the many sites of its manifestations In its acute or chronic form, brucellosis is second to no other disease in its ability to masquerade under invisible guises In 1939 Green published one of the earliest reports concerned exclusively with ocular manifestations in brucellosis [22] He reported four of his own cases and cited 28 others from the literature They included iritis, optic neuritis, choroiditis, uveitis, palsies of the ocular muscles, and retinitis

Harris, in a personal communication, stated, "In my own experience quite characteristic skin lesions appeared and disappeared along with other symptoms definitely attributable to brucellosis in 8 9 per cent of the first 247 cases tabulated"

The skin lesions fell into 12 main groups—often more than one type was present in the same patient

1 Macular, pink or red, scattered, itching lesions usually of the forehead, temple, cheeks, and occasionally the arms and trunk

2 Maculopapular or papular eruptions in small groups, anywhere in the body, often orange-red in color and occasionally with small central vesicle

3 Erysipelas-like lesions, usually in extremities, painful, tender, and accompanied by fever

4 Multiple patches of dusky, cyanotic, tender, painful nodules resembling erythema nodosum

5 Diffuse erythematous rash of entire body, high fever resembling scarlet fever

6 Scaly, reddish-brown, itching lesions, usually confined to arms and wrists, sometimes resembling psoriasis but lacking the typical scales

7 Crusting, seropurulent lesions, usually on arms and legs, somewhat resembling impetigo and perhaps due to secondary infection

8 Circinate and macular, pink, scaly lesions, closely resembling pityriasis rosea

9 Papular, maculopapular, and pustular contact dermatoses with distribution corresponding to exposed areas

10 Ulcerative dermatitis

11 Purpuric patches

12 Eczematous lesions and other unclassifiable skin conditions

Miscellaneous

For the sake of completeness, mention should be made of the following diseases that have associated eye and skin lesions

1 Pseudoxanthoma elasticum, associated with angioid streaks of the retina

2 Nutritional deficiencies, both avitaminosis and hypoproteinemia with its varied eye and skin manifestations

3 The recent recognition of German measles in the first months of pregnancy resulting in mothers giving birth to babies with congenital cataracts

4 Expression of syphilis in both the eye and skin

5 Cataract of neurodermatitis
   (*a*) That associated with scleroderma,
   (*b*) That associated with poikiloderma atrophicans vasculare (Rothmund's or Jacobi's Disease),
   (*c*) That associated with Darier's disease, erythema exudativa, Raynaud's disease, psoriasis, and other dermatogenous conditions Bellow states, "Whether the association is significant or merely fortuitous cannot be told with the limited cases reported" [23]

6 Ocular pemphigus with the more common pharyngeal involvement

7 Corneal involvement accompanying vaccinia, measles, or even variola

Conclusion

The association of ocular and dermatologic expressions of general disorders is sufficiently recognized today to stress the importance of a knowledge of both for the better recognition and handling of systemic disease

108 East 66th Street

Discussion

Rudolf L Baer, M D , *New York City*—Doctor

Givner has given a very complete review of the most important examples of dermatoses which are accompanied by manifestations in the eye I am quite certain that he could have extended this list considerably with many minor examples of associated dermatologic and ophthalmologic conditions However, it seems to me that considering the developmental relationship between eye and skin it is astonishing how relatively small a number of cases with severe eye complications actually occur in a large dermatologic material

What are the eye complications among the ten dermatoses which are most commonly seen in private dermatologic practice in New York City? There are three which affect the eyelids namely eczematous contact dermatitis, seborrheic dermatitis, and giant urticaria Fortunately these are conditions in which the involvement of the eyelids is not permanent, and there are no serious or lasting sequelae. However, in another one of the commonly seen dermatoses i e., atopic dermatitis (also called disseminated neurodermatitis or hay fever asthma eczema) the very rare complication of cataract formation occurs Because of this possible complication I believe that every case of persistent, severe atopic dermatitis should have eye examinations at regular intervals The type of cataracts seen in atopic dermatitis is sufficiently different from other cataracts to have been distinguished by the name "atopic cataract However I do not think that this name is justified since to my knowledge no similar cataract formation occurs in the other atopic diseases such as asthma and hay fever etc These cataracts develop in young people who have had atopic dermatitis for periods varying from one to twenty years

Some evidence has been cited in the literature which indicates that the cataracts tend to progress, particularly after a severe flare-up of the dermatitis It seems to me that, if this observation is correct the possibility exists that cataract formation may be stopped in those cases if the dermatitis can be cleared up In some of the most severe cases where this result cannot be effected by the usual forms of therapy available in New York a change of environment to a hot dry climate such as in New Mexico or Arizona, is often very beneficial This suggests that cases of atopic dermatitis with incipient cataracts should, whenever possible be sent to one of these climates where most cases of atopic dermatitis tend to clear up

After the occurrence of atopic dermatitis and cataract was noted some observers considered the possibility that roentgen radiation given to the skin of the face might be responsible for the cataracts, but this theory had to be abandoned as there have been quite a few cases of atopic dermatitis with cataracts who never received roentgen therapy. Furthermore this type of cataract formation does not occur in the many thousands of cases of acne vulgaris who have received roentgen ray therapy to the face

I was greatly interested in what Dr Givner had to say about eye changes in acute disseminated lupus erythematosus Has he observed any eye changes in the chronic discoid form of lupus erythematosus? There is no agreement among dermatologists as to whether lupus erythematosus of the acute disseminated form and of the chronic discoid form are related diseases or whether they are entirely separate entities Still it would be interesting to know whether eye changes are ever seen in the chronic discoid form

As to the sarcoid forms involving the eyes, I wonder whether Dr Givner has had any experience with Calciferol treatment This form of therapy which was first developed by the French and English for the treatment of lupus vulgaris, has been found effective in the treatment of some cases of sarcoid Concerning the diagnosis of sarcoid I would like to add that, in addition to the negative tuberculin tests (positive anergy) there is now available the Kveim test which according to many Scandinavian observers is thought to be quite specific for sarcoid disease

VOICE OF EXPERIENCE

My wife, who is also the mother of my six children ordinarily answers the telephone for me Recently a woman called up and asked if I were a doctor of medicine After my wife had assured her I was, the woman inquired hesitantly, 'Does the doctor practice that there birth control? Said my wife, who is never at a loss for words 'Not to my knowledge. —*Medical Economics July 1948*

NUTRITIONAL REQUIREMENTS IN CONVALESCENCE

HERBERT POLLACK, M D , and JOHN BOOKMAN, M D , New York City

(From the Metabolic Division of the Medical Services, Mt Sinai Hospital)

WHEN one uses the term "nutrition," the connotation is "malnutrition" The broad definition of this term is abnormal nutrition This means that starvation, emaciation, and obesity are all forms of malnutrition Malnutrition predisposes to poor health Public health surveys have shown that both obesity and undernutrition lead to greater incidence of diseases Obesity is associated with the greater frequency of degenerative conditions such as hypertension and arteriosclerosis Undernutrition is associated with the rapid spread and more virulent types of infectious diseases These facts have been well disseminated and will not be further discussed here

On the other hand, the influence of disease or injury on nutrition is less well known and appreciated The work to be reported here will deal largely with this aspect of the problem To review briefly, the factors involved are the adequacy or inadequacy of food intake for the conditions under which the patient is living By this is meant the actual intake of food by the patient It is not remiss to mention that frequently a perfectly adequate diet is prescribed by the physician and served to the patient Not infrequently, this diet is rejected by the patient, either wholly or in part The actual amount of food consumed and retained must be considered the intake The understanding of the requirements is important in determining the adequacy Most of the standard tables of food requirements are based on normal, healthy, ambulatory people The tables give caloric, protein, and vitamin requirements for the various age, sex, and work groups Some even mention a correction factor in total caloric requirements for fever The simple caloric allowance increase in fever or disease is incomplete and misleading All the specific metabolic requirements are increased This is especially true for protein, except in such conditions as typhoid fever and tuberculosis where the nitrogen requirement apparently does not change appreciably In contrast, pneumonia increases both caloric and protein needs

The protein requirements for the sick and wounded vary considerably from the normal There is usually a loss of protein from the body stores This loss can occur in two ways, and it is important to understand these two mechanisms which may operate simultaneously One is the mechanical loss of proteins through hemorrhage, exudates, and transudates, the classic example occurring in extensive burns The other large loss of nitrogen occurs in the so-called catabolic states The mechanism of this loss is not understood Thus, however, should not detract from the important and insidious nature of this process Here, there is a relatively large excretion of nitrogenous substance in the urine (principally urea) originating from the breakdown of body proteins One of the points we shall discuss is the concomitant phenomena of this protein breakdown and their influence on other nutritious requirements, more specifically the B vitamins

Even if an adequate diet is ingested and not vomited by the patient, there is the problem of absorption and digestion These have been discussed at length many times, and yet their importance prompts us to review them, in part, again and to present actual experimental data showing their far-reaching influence Absorptive failure is seen in those conditions where the bowel wall is diseased, such as lymphosarcoma and regional ileitis Surgical procedures which short circuit the bowel will decrease the surface available for absorption These facts have been observed clinically, so that we shall only present data illustrating the extent of these effects

The intermediary metabolism of the foodstuffs has not, as yet, been clearly outlined, and consequently the part it plays in the over-all metabolic picture also remains to be seen For example, the liver deaminizes the amino acids and synthesizes the carbohydrate fragments into fat The channels of these processes are poorly understood

The ultimate aim of the ingestion of food is its utilization by the body The term utilization, then, represents the end point of all the reactions previously mentioned The utilization is not confined to the currently ingested food but includes the stored food elements also In the presence of an inadequate intake, stores will be called upon to supply the difference between intake and the normal, as well as the abnormal, requirements

The mechanics of utilization, as well as the mechanics of the intermediary metabolism, are catalyzed by a series of enzymes In part, these enzymes are composed of combinations of the B vitamins and protein molecules Obviously, a

Presented at the 142nd Annual Meeting of the Medical ociety of the State of New York, New York City Teaching Day May 18 1948.

failure of the enzyme system will result in a failure in utilization and, conversely a failure in utilization will result in a failure of the enzyme system Thus if the proper proteins are not made available, vitamin deficiency syndromes can appear in the presence of an adequate vitamin intake.

Case Reports

Case 1—C W , a woman aged thirty four was admitted with history of numerous food intolerances. During the course of a few years she had eliminated practically all the foods from her daily diet. Her weight on admission was 88 pounds, the previous normal having been 120 pounds The data shown in Fig 1 reveals that her intake on the ward was initially good Within three days however she reverted to former intake as reflected by decreased nitrogen intake and excretion By simple forced feeding the picture reversed itself and there was a gain of 2 Kg body weight in nine days

Case 2—In contrast is the patient Mrs B S a thirty four year-old woman, who had a history of regional ileitis with marked diarrhea for two and a half years. She had an ileosigmoidostomy involving practically all of the ileum, ascending, transverse and descending colon Subsequently, there was gradual weight loss and large frequent, copious bowel movements While she was on the metabolism ward studies were made. Charcoal markers appeared in the stool in from three to four hours. The fecal nitrogen averaged 7.5 Gm. every day This indicated a lack of absorptive surface and failure of utilization. She was then subjected to surgical procedure at which time the ileosigmoidostomy was closed and the ileum re-anastomosed, except for a short piece of terminal ileum which was left as a blind loop Following this procedure the patient was again studied on the metabolic ward There was indication of increased absorption as shown by decreased fecal and markedly increased urinary nitrogen excretion The fecal nitrogen did not, however, return to entirely normal levels (Fig 2) In spite of this evidence of increased absorption from the gastrointestinal tract there was little gain in weight and persistence of the manifestations of the deficiency syndrome in the tongue gums and lips Here now was evidence of failure of utilization The urinary studies showed adequate amounts of the B vitamins present. (Patient was given vitamin therapy parenterally and orally up to the time of the study) The high urinary levels of nitrogen excretion indicated a failure on the part of the body to retain nitrogen or go into a markedly positive nitrogen balance. Thus the simple mechanical restoration of the gastrointestinal tract did not restore the metabolic processes involved in utilization This patient illustrates the presence of a deficiency syndrome usually attributed to a vitamin deficiency in the presence of adequate vitamins, where the deficiency was in the protein anabolism.

Case 3—D F a fourteen-year-old boy was markedly underweight. There was a long history of asthma which had led to numerous diet restric

NUTRITIONAL REQUIREMENTS IN CONVALESCENCE

HERBERT POLLACK, M D , and JOHN BOOKMAN, M D , New York City

(From the Metabolic Division of the Medical Services, Mt Sinai Hospital)

WHEN one uses the term "nutrition,' the connotation is "malnutrition " The broad definition of this term is abnormal nutrition This means that starvation, emaciation, and obesity are all forms of malnutrition Malnutrition predisposes to poor health Public health surveys have shown that both obesity and undernutrition lead to greater incidence of diseases Obesity is associated with the greater frequency of degenerative conditions such as hypertension and arteriosclerosis Undernutrition is associated with the rapid spread and more virulent types of infectious diseases These facts have been well disseminated and will not be further discussed here

On the other hand, the influence of disease or injury on nutrition is less well known and appreciated The work to be reported here will deal largely with this aspect of the problem To review briefly, the factors involved are the adequacy or inadequacy of food intake for the conditions under which the patient is living By this is meant the actual intake of food by the patient It is not remiss to mention that frequently a perfectly adequate diet is prescribed by the physician and served to the patient Not infrequently, this diet is rejected by the patient, either wholly or in part The actual amount of food consumed and retained must be considered the intake The understanding of the requirements is important in determining the adequacy Most of the standard tables of food requirements are based on normal, healthy, ambulatory people The tables give caloric, protein, and vitamin requirements for the various age, sex, and work groups Some even mention a correction factor in total caloric requirements for fever The simple caloric allowance increase in fever or disease is incomplete and misleading All the specific metabolic requirements are increased This is especially true for protein, except in such conditions as typhoid fever and tuberculosis where the nitrogen requirement apparently does not change appreciably In contrast, pneumonia increases both caloric and protein needs

The protein requirements for the sick and wounded vary considerably from the normal There is usually a loss of protein from the body stores This loss can occur in two ways, and it is important to understand these two mechanisms which may operate simultaneously One is the mechanical loss of proteins through hemorrhage, exudates, and transudates, the classic example occurring in extensive burns The other large loss of nitrogen occurs in the so-called catabolic states The mechanism of this loss is not understood This, however, should not detract from the important and insidious nature of this process Here, there is a relatively large excretion of nitrogenous substance in the urine (principally urea) originating from the breakdown of body proteins One of the points we shall discuss is the concomitant phenomena of this protein breakdown and their influence on other nutritious requirements, more specifically the B vitamins

Even if an adequate diet is ingested and not vomited by the patient, there is the problem of absorption and digestion These have been discussed at length many times, and yet their importance prompts us to review them, in part, again and to present actual experimental data showing their far-reaching influence Absorptive failure is seen in those conditions where the bowel wall is diseased, such as lymphosarcoma and regional ileitis Surgical procedures which short circuit the bowel will decrease the surface available for absorption. These facts have been observed clinically, so that we shall only present data illustrating the extent of these effects

The intermediary metabolism of the foodstuffs has not, as yet, been clearly outlined, and consequently the part it plays in the over-all metabolic picture also remains to be seen For example, the liver deaminizes the amino acids and synthesizes the carbohydrate fragments into fat The channels of these processes are poorly understood

The ultimate aim of the ingestion of food is its utilization by the body The term utilization, then, represents the end point of all the reactions previously mentioned The utilization is not confined to the currently ingested food but includes the stored food elements also In the presence of an inadequate intake, stores will be called upon to supply the difference between intake and the normal, as well as the abnormal, requirements

The mechanics of utilization, as well as the mechanics of the intermediary metabolism, are catalyzed by a series of enzymes In part, these enzymes are composed of combinations of the B vitamins and protein molecules Obviously, a

failure of the enzyme system will result in a failure in utilization and, conversely, a failure in utilization will result in a failure of the enzyme system. Thus if the proper proteins are not made available, vitamin deficiency syndromes can appear in the presence of an adequate vitamin intake.

Case Reports

Case 1.—C. W., a woman aged thirty four was admitted with history of numerous food intolerances. During the course of a few years she had eliminated practically all the foods from her daily diet. Her weight on admission was 88 pounds, the previous normal having been 120 pounds. The data shown in Fig. 1 reveals that her intake on the ward was initially good. Within three days however, she reverted to former intake as reflected by decreased nitrogen intake and excretion. By simple forced feeding the picture reversed itself and there was a gain of 2 Kg. body weight in nine days.

Case 2.—In contrast is the patient Mrs. B. B., a thirty four year-old woman, who had a history of regional ileitis with marked diarrhea for two and a half years. She had an ileosigmoidostomy involving practically all of the ileum, ascending, transverse and descending colon. Subsequently there was gradual weight loss and large, frequent copious bowel movements. While she was on the metabolism ward studies were made. Charcoal markers appeared in the stool in from three to four hours. The fecal nitrogen averaged 7.5 Gm. every day. This indicated a lack of absorptive surface and failure of utilization. She was then subjected to surgical procedure at which time the ileosigmoidostomy was closed and the ileum re-anastomosed, except for a short piece of terminal ileum which was left as a blind loop. Following this procedure, the patient was again studied on the metabolic ward. There was indication of increased absorption as shown by decreased fecal and markedly increased urinary nitrogen excretion. The fecal nitrogen did not however, return to entirely normal levels (Fig. 2). In spite of this evidence of increased absorption from the gastrointestinal tract there was little gain in weight and persistence of the manifestations of the deficiency syndrome in the tongue, gums and lips. Here, now was evidence of failure of utilization. The urinary studies showed adequate amounts of the B vitamins present. (Patient was given vitamin therapy parenterally and orally up to the time of the study.) The high urinary levels of nitrogen excretion indicated a failure on the part of the body to retain nitrogen or go into a markedly positive nitrogen balance. Thus the simple mechanical restoration of the gastrointestinal tract did not restore the metabolic processes involved in utilization. This patient illustrates the presence of a deficiency syndrome usually attributed to a vitamin deficiency in the presence of adequate vitamins where the deficiency was in the protein anabolism.

Case 3.—D. F., a fourteen-year-old boy was markedly underweight. There was a long history of asthma which had led to numerous diet restric-

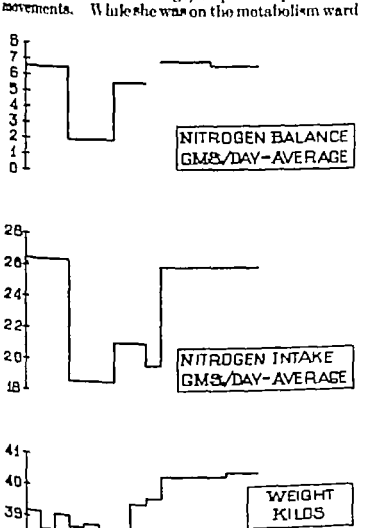

FIG. 1

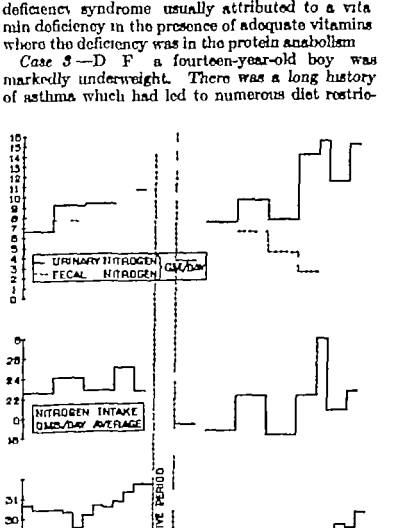

FIG. 2.

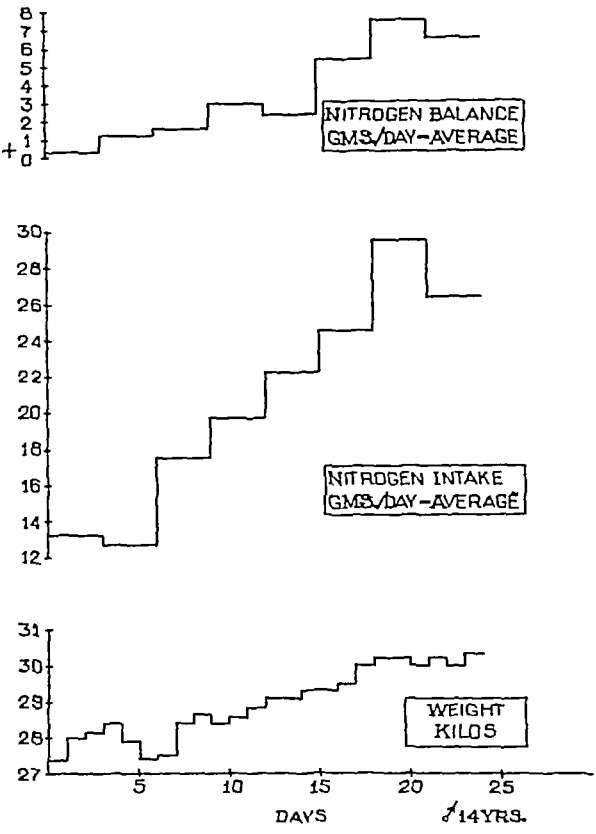

FIG 3

tions He was admitted for study of the type of *nutritive failure* Figure 3 shows that the only nutritive failure was the inadequacy of ingestion of nutrients The urinary nitrogen weight and nitrogen balance responded immediately and progressed to proper feeding The supplement was a skimmed milk powder with lactalbumin

Having established the fact that the nutritional requirements for the sick and injured are higher than for the normal person, one must look further into the causes of nutritional inadequacies What is most important, however, is the food that is offered to the patient and whether or not he is willing and able to accept it The basic nutritional requirements of the individual continue from day to day, increasing, as pointed out, during the catabolic periods and decreasing after long periods of semistarvation

The first two or three days postoperatively in any patient are usually very difficult ones The traditional liter or two of glucose supplies such a small part of the total nutritive requirements that the patient is obviously in a period of depletion of his reserves Too often the patient, because of his antecedent prolonged illness, has already drawn on these reserves and is in a period of real malnutrition when he needs optimum nutrition to insure his rapid convalescence and wound healing The conventional postoperative feeding schedules, illustrated in the tables, do not make a real effort to meet the current increased metabolic demands, much less replenish the depleted reserves (Tables 1 and 2) Actual calculations of feeding schedules, contrasted with the nutrional metabolic requirements, show that even if a patient ate all of the food presented during his first ten days he would still not meet his current requirements

These dietary inadequacies are not only common to the surgical patient but also to the medical patient Analyses of a conventional soft diet, the liberal Sippy diet, and the colitis diet reveal the *same* situation in these patients as in the *postoperative patient*

The Sippy diet analysis is represented in Table 3 The fundamental difficulty involved in securing optimal nutrition for sick, injured patierts dates back to the inadequate training which medical students receive in the translation of the

principles of nutrition to food as eaten The attending physician must be constantly aware of the nutritional status of his patient He should know when anorexia becomes a problem and when it interferes with the patient's progress The physician is charged with the responsibility of teaching the patient the family, and the nurse what he is trying to accomplish and how best to meet the situation It is the physician's and surgeon's responsibility to keep abreast of the progress in this field of nutrition as well as the technical, surgical, and chemotherapeutic discoveries.

In the hospital, the dieticians can be used to greater advantage than is currently appreciated by the administrative heads of these institutions The emphasis is wrongly placed in many hospitals at present The dietician is forced to add columns of figures instead of being allowed to emphasize the clinical aspects of her profession She must spend more time with the patient She must look at food from the patient's point of view and must be aggressive in her handling of the anorexic patient

Where highly trained dietetic personnel are not available, then the duties of the nursing staff must be enlarged to embrace this field In the large city hospitals the floor nurse is perhaps the only person who has constant supervision and intimate acquaintance with the patients She will know whether the patient is refusing an appreciable amount of the food offered on his tray The nurse must be educated to retailing this information to the house staff The house staff must learn to have a sympathetic and inquiring manner for this information The ultimate responsibility is, of course the attending physician's, since it is his actions and attitudes that guide the house staff

This work was supported in part by grants-in-aid from the New York Foundation the American Dry Milk Institute the National Poultry and Egg Board, and E R. Squibb and Company

MALE HORMONE THERAPY

Within a decade the application of male hormone therapy to gynecology and other special branches of medicine has assumed a position of paramount importance New forms of treatment come and go with bewildering rapidity but the permanence of this therapy remains without question Its benefits, however, are by no means unalloyed and it is sometimes difficult to steer between the Scylla of relieving distressing hyperestrogenic conditions and the Charybdis of masculinisation resulting from treatment But a *via media* can be found Male hormone therapy can be advised in all forms of hyperestrinemia in adult life When used in younger women it should be only a very temporary form of therapy and the dosage must be moderate. Minute doses of male hormone stimulate femininity, moderate doses depress, and massive doses completely antagonize it.

Androgen therapy in breast cancer cannot up to now be regarded as a cure, but it is certainly helpful for the bone metastases and pain It remains to be seen whether or not it will have any value as a postoperative prophylactic.—*Alfred A Loeser M.D., Obstetrical and Gynecological Survey, June, 1948*

POSTOPERATIVE IRIDOCYCLITIS

ALBERT C SNELL, JR , M D , Rochester, New York

(From the Departments of Ophthalmology of the University of Rochester, School of Medicine and Dentistry, and the Rochester General Hospital)

THE incidence of iridocyclitis following intraocular surgery obviously indicates a causal relationship between the surgery and the iridocyclitis The purpose of this discussion is to review the mechanisms by which surgical interference can provoke intraocular inflammations

It is essential first to examine the nature of the stimuli which produce inflammation in general In the last analysis these stimuli must be biologically active chemical factors The principal source of these chemicals (histamine-like substances or leukotaxine as described by Menkin) is the injured or destroyed cell [1] Cellular injury may well be the final common path of action by means of which an inflammatory response is elicited by such various agents as traumatization, thermal and radiant energy effects, and bacterial toxins and other poisons However, since the nature of the inflammatory response corresponds in some respects with the various injuring agents, factors other than tissue injury alone are obviously of significance. Moreover, some allergic reactions show a marked disproportion between the amount of apparent tissue injury and the degree of inflammation

For the purpose of this discussion it is convenient to classify the general sources of inflammatory stimuli as (1) traumatic injury, (2) bacterial toxins, and (3) allergic states

It is much more difficult to make generalizations about the nature of the stimuli which control the processes of repair Repair processes are usually intermingled with those of inflammation but are thought of as relatively distinct, these include the growth of new blood vessels, fibroblastic proliferation, and multiplication of the cells of the particular tissues interrupted, in various degrees The stimuli responsible for these activities are recognizable as growth-controlling mechanisms, about which so much remains to be learned While qualitative differences evidently exist between the factors controlling repair and those controlling inflammation, there may be some overlapping, in that injured or destroyed tissue appears to act as a stimulus for both processes Also, both inflammation and repair may require the integrity of the nervous system for their orderly behavior

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Ophthalmology and Otolaryngology May 20 1948

With this background in mind, the concept of post-traumatic intraocular inflammation should first be examined Post-traumatic iridocyclitis is considered here as that resembling a sort of concussion effect The pathologic course of concussion iridocyclitis may be reconstructed as follows the impact received by the eye is severe enough to cause multiple tears in the iris, ciliary body, choroid, retina, lens, sclera, etc Some of the tears involve capillaries and larger blood vessels, and interstitial hemorrhages in various degrees occur The vascular defects and the pressure of the escaped blood may result in focal areas of ischemia, so that previously undamaged cells are consequently unable to survive Thus, a significant amount of tissue is injured or destroyed, both by the actual injury and by secondary effects on cellular metabolism Since injured tissue is a stimulus to inflammation, it is not surprising that a post-traumatic iridocyclitis often occurs If the damage involves particularly the posterior segment, the clinical picture of traumatic chorioretinitis results, and this differs only in location from post-traumatic concussion iridocyclitis

How much of this concept of post-traumatic concussion iridocyclitis can be implicated in the etiology of postoperative iridocyclitis? Certainly, if it is true that destroyed and decaying tissue is an adequate stimulus for inflammation, then the more tissue destroyed as a result of operation, the more likely is the postoperative course to be stormy It is, therefore, well to consider that the degree of crushing, tearing, and cutting could significantly affect the postoperative course Important amounts of tearing could be sustained by the ciliary body when resistant zonules are tugged upon, and, if such tears include capillaries, the factor of interstitial hemorrhage is added In the same way undue traction on the iris could give rise to significant tears Destruction of corneal tissue could provide another source of similar stimuli On the whole, however, the type of changes described as concussion iridocyclitis should not be a large factor in operations They could be an important factor in the high incidence of iridocyclitis after penetrating trauma

The presence of exposed lens cortex is a second postoperative situation which should be examined as a source of inflammatory stimuli The mechanisms whereby lens protein may initiate inflammation include the three principal types al-

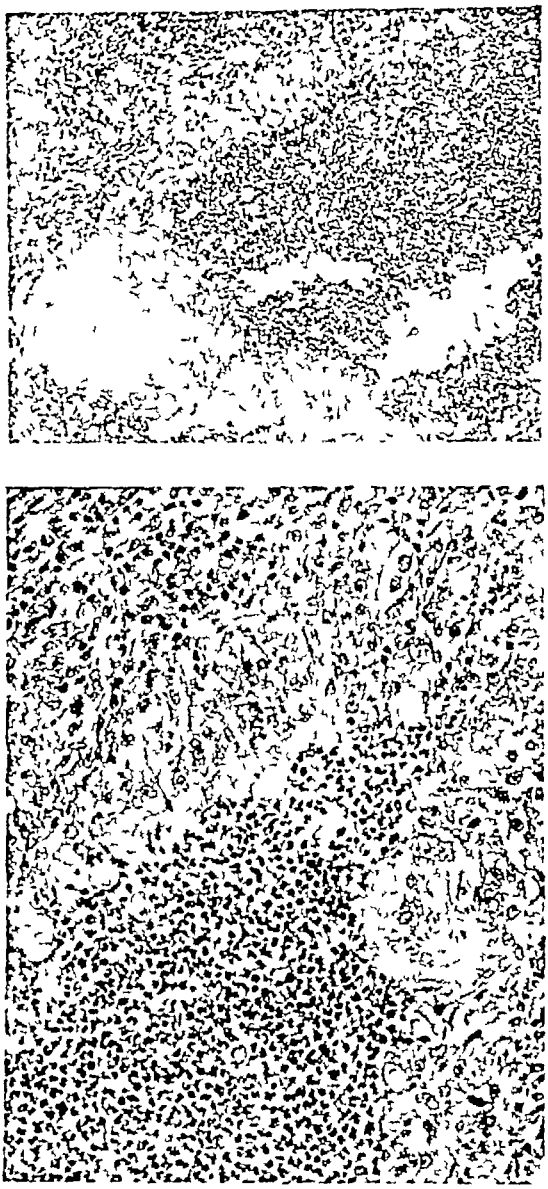
FIG. 1 Invasion of ruptured lens capsule with inflammatory cells

FIG 3 Degenerating lens cortex after rupture of the capsule exhibiting practically no inflammatory response although a proliferative reaction from the iris is present

ready outlined the inherent toxicity of degenerating tissue, irritating bacterial products, and allergic reactions For each of these situations peculiarities exist in the eye which strongly influence the inflammatory reactions

First, as a source of degenerating tissue, wounds of the lens capsule are unique When the lens capsule is cut, there is destroyed not only the tissue in the actual path of the instrument but the entire contents of the capsule The fact that such wounds do not lead invariably to important degrees of inflammation argues that degenerating lens substance is a weak inflammatory stimulant or becomes denatured so slowly that effective concentrations of inflammatory stimulants fail to build up The conflicting evidence as to the toxicity of lens protein is well summarized by Bellows.[3] It is reasonable to regard lens substance unprotected by the intact capsule as a potential inflammatory agent. Figures 1 and 2 illustrate reactions to lens substance by inflammatory cells

Since injured or destroyed tissue may be one of the factors affecting repair as well as inflammation it is not surprising that active fibroblastic responses are seen in conjunction with postoperative or post traumatic iridocyclitis where large amounts of lens cortex are present The proportions of the two processes may vary Figure 3 shows a lens injury with practically no inflammatory response but with a delicate fibroblastic outgrowth from the adjacent iris. Figure 4 shows an intense fibroblastic response and a moderate inflammatory response late in the course of a through and through injury to the lens



The second mechanism, whereby lenticular remains may provoke an iridocyclitis, lies in the peculiar susceptibility of the lens to bacterial invasion Lens substance is a good culture medium for bacteria and at the same time is relatively defenseless Obvious lens abscesses are not an un

FIG 2. Inflammatory reaction to degenerating lens cortex which is being invaded by lymphocytes and large mononuclear phagocytes

FIG 4 Moderate inflammatory reaction and severe proliferative reaction to a transfixing wound of the lens

FIGS 5 and 6 A lens abscess associated with a granulomatous type of inflammatory response

common pathologic finding, especially after perforating injuries However, the term iridocyclitis is not applied to the purulent bacterial intraocular inflammations Nevertheless, it is probable that infection of the lens or its remains with relatively avirulent organisms can produce the clinical and histologic findings of an iridocyclitis

The third mechanism, whereby inflammatory stimulants may arise from the lens, is by the development of an allergic state The fact that the lens is immunologically organ-specific is the basic ocular peculiarity which sets the stage for such an event, that is, the sensitization of the eye to lens protein with the eventual development of a vigorous inflammatory reaction The frequency of this complication is discussed by Hughes and Owens [3] These authors compiled data of their own and other observers which showed that intradermal skin tests with extracts of lens protein were positive in 75 per cent of cases of extracapsular cataract extraction with postoperative iridocyclitis and positive in 11 per cent of such cases uncomplicated by postoperative iridocyclitis

It is notoriously difficult to sensitize the eyes of experimental animals to lens protein This has been done most successfully by Burky where lens protein and a bacterial toxin have been simultaneously used as antigens [4] Figures 5 and 6 illustrate the association of a lens abscess with a severe granulomatous type of inflammatory reaction In this instance, the unusual severity of the granulomatous reaction may arise from the simultaneous effects of the bacterial growth and the rapidly degenerating lens protein, duplicating Burky's combination Some observers have suggested that a granulomatous inflammation may connote an allergic state, although this is not universally accepted [5] The findings in phaco-anaphylaxis described by Verhoeff and Lemoine do not include a granulomatous reaction [6]

In addition to tissue injury and lenticular remains, intraocular hemorrhage may provide a third source of postoperative inflammatory stimuli Blood outside of blood vessels is often moderately irritating The degenerating products of red cells and other blood constituents, like those of other tissues, are handled by an inflammation which varies in degree with the amounts of associated irritants Extravascular blood within the eye, especially where other stimulants to inflammation are present, can be considered as a factor influencing the severity of the inflammatory process The anterior chamber of the eye appears to embody a special mechanism for the rapid absorption of blood However, when this mechanism is rendered ineffective, especially in the presence of severe degrees of trauma, organization of the hemorrhage by infiltration of fibrous tissue can occur The resulting intraocular scar tissue is usually disastrous Thus, the fact that hemorrhage may act as a stimulus to the process of repair may exceed in importance its stimulus on the process of inflammation In Fig 7, an anterior chamber hemorrhage is being replaced by newly forming fibrous tissue but with minimal inflammatory reaction

One of the proved causes of an increased incidence of postoperative iridocyclitis is loss of vitreous What may be the reason for this? There is little reason to believe that vitreous in the anterior chamber is intrinsically an irritant The pro-

FIG. 7 Organizing anterior chamber hemorrhage with mild inflammatory reaction

teins of the vitreous are so small in amount and in such a chemically stable state that it seems unlikely, even if the hyaloid face is broken after cataract extraction and intermingled with aqueous that this traumatization of the vitreous would in itself lead to the liberation of any significant amounts of toxic material Thus is substantiated by the relative impunity with which vitreous can be withdrawn from one eye and inserted into another, even of another individual [7] Therefore other speculations might be developed

One explanation for the relation between loss of vitreous and iridocyclitis may be found in the fact that vitreous may interfere with the rapid and solid healing of the wound In the immediate postoperative period, the presence of vitreous could prevent approximation of the lips of the wound The larger the gap between the margins of the wound, the greater the inflammatory reaction would be produced because the debris, fibrin hemoglobin and inflammatory cellular residue which initially fill this gap will provide increased amounts of the factors which initiate inflammation Also vitreous may carry into the wound margins of iris or lens capsule, if extracapsular cataract extraction, and these may delay healing and consequently prolong inflammation or as stresses occur on the imperfectly sealed wound, microscopic hemorrhages which themselves contribute to inflammation may occur in the wound Figure 8 illustrates a gaping wound associated with inflammatory and proliferative reactions.

There are a few other conceivable sources of postoperative irritations which could lead to inflammatory responses and these are mentioned for the sake of completeness. One of these is the possibility of interference with the nerve supply trophic changes and tissue destruction are an occasional effect of denervation and perhaps this effect occurs within the eye Conversely, irritation of nerves by traction or compression on the part of fibrous tissue might evoke an inflammatory response of neurogenic origin An intraocular foreign body is another source of postoperative iridocyclitis Finally the possibility of a virus infection and/or the development of a hypersensitive state to uveal pigment may account for some instances of iridocyclitis as has been suggested in the case of sympathetic ophthalmia

In searching for the mechanisms whereby the effects of operation may lead to postoperative inflammatory states, one last possibility deserves mention Operation may touch off an iridocyclitis for which the stage has been set by previous events and which might otherwise have remained subclinical In other words, the trauma of operation may act merely as a precipitating and localizing stimulus for a kind of inflammation that is usually spontaneous

Summary

The pathogenic mechanisms by means of which intraocular surgery may evoke postoperative iridocyclitis are discussed Factors listed as possible stimulants to postoperative inflammations include tissue traumatization lenticular remains intraocular hemorrhage loss of vitreous neurotrophic effects low-grade bacterial infection, virus infection intraocular foreign bodies, and allergic reactions to uveal pigment.

Discussion

Searle B Marlow M.D *Syracuse*—Dr Snell has presented a picture of postoperative iridocyclitis which involves a number of considerations the relative importance of which is hard to evaluate The incidence of postoperative iridocyclitis varies

FIG 8. Inflammatory and proliferative reactions between the separated margins of a corneal wound.

THE INTRAPERITONEAL USE OF STREPTOMYCIN

ANGELO A ZINGARO, M D , New York City

(From the Surgical Service of the Lutheran Hospital of Manhattan)

ALTHOUGH a great deal of literature has appeared on the systemic or parenteral use of the antibiotics, very little has been written in the last year on the topical administration or the intraperitoneal use of streptomycin A survey of the current medical journals reveals that the U S Public Health Service and the U S Army Medical Corps are responsible for a considerable amount of the literature As late as March, 1948, two reports on the topical use of streptomycin have appeared E L Howes reported in the *American Journal of Medicine*, May, 1947, the topical administration of streptomycin, alone and in combination with penicillin and sulfamylon The March issue of the *Canadian Medical Association Journal* includes an article by H S Morton, who employed streptomycin topically in a case of appendicial abscess with creditably good results

Observers of the parenteral method of administration are many, and they have stated that the results are satisfactory in peritonitis cases In the reports, however, there appeared to be an undertone of a lack of appreciation of its value Many will recall the intraperitoneal use of the sulfonamides and the early glowing reports This knowledge led the writer to use streptomycin intraperitoneally in a severely contaminated surgical procedure with a result so satisfactory that the antibiotics have been used repeatedly in other badly contaminated abdominal surgical cases with results so unexpected that the case histories are being presented

It is a well-known fact that the antibiotics are distributed to the peritoneal fluids and to fluids of other serous cavities However, it is not known whether the antibiotics pass through the natural protective barriers set up by the defense mechanism of the body tissues Therefore, the idea of using streptomycin topically occurred to the writer when the first of a series of severely contaminated surgical cases presented itself for treatment

Case Reports

Case 1 —M B , a forty-four-year-old woman, was admitted to the Lutheran Hospital on November 26, 1947, and discharged on January 31, 1948 Her chief complaint was intermittent abdominal pain with vomiting of twenty-four hours duration There was no history of diarrhea or constipation, and there had been no previous hospitalization or operative procedures She presented the appearance of a fairly well-developed woman who was in no apparent distress Temperature on admission was 100 4 F and pulse 86 The abdomen appeared flat There was no tenderness or rigidity, and no scars were visible, there were no palpable masses present X-ray examination showed dilated jejunal loops in the left upper quadrant A diagnosis of small bowel obstruction was considered The urine was essentially negative The blood studies showed a white blood count of 12,500 with a differential count of 88 per cent polymorphonuclears

Five days after admission patient's abdomen became markedly distended, and an emergency exploratory laparotomy was performed A band of adhesions was found which constricted the terminal ileum approximately 3 inches from the ileocecal junction The bowel at this point had become gangrenous, and in freeing the adhesion the contents of the small intestine contaminated the peritoneal cavity An ileostomy was performed The peritoneal cavity was aspirated of the contaminating intestinal contents Sulfathiazole powder together with 1,000,000 units of penicillin and 1 Gm. of streptomycin were introduced into the peritoneal cavity The abdomen was closed in layers around the ileostomy tube and patient returned to bed

Following a stormy postoperative period during which there was a breakdown in the wound healing and the formation of an intestinal fistula, the patient was prepared for a short circuiting operation On January 16, 1948, through a left rectus incision, an ileotransverse colostomy was performed, and the terminal ileum was excluded Again streptomycin powder was introduced into the peritoneal cavity The patient's postoperative course was uneventful Both abdominal wounds healed rapidly

Case 2 —S L , a twenty-six-year-old man, was admitted to the hospital on March 3, 1948, and discharged on March 27, 1948 His chief complaint was pain in the right lower quadrant of ten days duration He had been complaining of vague abdominal pain localized to the right lower quadrant and flank, associated with nausea but no vomiting He was admitted to the hospital for a genitourinary examination and was afebrile during this period On March 11, eight days after admission, he had a severe chill, temperature rising to 103 F A large palpable mass was present in the right lower quadrant A diagnosis of acute appendicitis with abscess formation was made Through a McBurney incision an edematous, inflamed cecum and appendix were found The appendix was removed One gram of streptomycin powder was placed in the peritoneal cavity and the wound closed in layers around a cigarette drain The patient's postoperative recovery was smooth and uneventful

Case 3 —T C , an eighty-three-year-old woman, was admitted on March 26, 1948, complaining of

severe abdominal pain and constipation of several days duration Cathartics and enemata were ineffectual On examination the abdomen was found to be markedly distended X-ray studies of the abdomen revealed fluid levels The blood was essentially normal except for a high leukocyte count She was prepared for operation and through a right rectus incision distended loops of small and large bowel were found. A constricting carcinoma of the sigmoid was also present A cecostomy was performed, during which procedure the abdominal cavity was contaminated One gram of streptomycin powder and penicillin were introduced in the peritoneal cavity The pelvis was drained through a cigarette drain, and the cecostomy tube was brought out through a McBurney incision

The postoperative course was stormy Three weeks following her first operation, an attempt was made to remove the carcinoma of the sigmoid through a low left rectus incision Because of the patient's general condition a first stage Mikulicz type of operation was performed One gram of streptomycin powder was introduced into the peritoneal cavity and the wound closed around the double-barreled colostomy

Patient's convalescence was uninterrupted until May 4 when she developed a cerebral complication from which she died

Case 4.—K. S., a forty-eight year-old woman was admitted on March 13 1948, and discharged on March 30 1948 Her chief complaint was general and abdominal pain with nausea and vomiting The admission diagnosis was acute appendicitis with peritonitis Temperature on admission was 102 F., and pulse was 80 The blood count showed a leukocytosis of 19,000 with a differential count of 82 per cent polymorphonuclears and 18 per cent lymphocytes Her abdomen was distended and tender throughout especially over the lower abdomen. Through a low right rectus incision the abdomen was explored and a gangrenous ruptured appendix found in the pelvis The diseased appendix was removed One gram of streptomycin was introduced into the peritoneal cavity and the wound closed around drains The postoperative course was smooth The wound healed firmly and the patient was discharged seventeen days postoperatively

Case 5.—M. D., a fifty five-year-old well-developed man was admitted on March 30 1948 and discharged on April 10 1948 He complained of severe, persistent vomiting The temperature on admission was normal The blood count showed a high leukocytosis of 18,000 with 84 per cent polymorphonuclears and 16 per cent lymphocytes The patient was prepared for operation and through a McBurney incision a gangrenous appendix lying in the right lumbar gutter was removed One gram of streptomycin was introduced in the peritoneal cavity and the wound closed around a cigarette drain Patient's postoperative period was uneventful and he was discharged on the tenth postoperative day

Case 6.—A. P., a fifty-seven-year-old man, was admitted on April 9 1948, and discharged on April 21 1948 He complained of severe lower abdominal pain of twenty four hours duration. Examination revealed a well-developed man with distention and and tenderness over the lower abdomen The white count showed a leukocytosis of 8,500 with 83 per cent polymorphonuclears and 17 per cent lymphocytes. Temperature on admission was 102 F The abdomen was explored through a low right rectus incision and a gangrenous appendix with spreading peritonitis found The appendix was removed One gram of streptomycin powder was placed in the peritoneal cavity and the wound closed around a cigarette drain The postoperative course was smooth and patient was discharged on the twelfth postoperative day

Case 7.—M. C., a fifty-seven year-old man, was admitted on February 4 1948, and discharged on February 28 1948 The diagnosis on admission was carcinoma of the rectum biopsy revealed this to be an adenocarcinoma. He was prepared for a one-stage abdominoperineal resection of the rectum Through a low left rectus incision the sigmoid was divided between clamps and a left inguinal colostomy was performed The distal end of the sigmoid and rectum were mobilized and a new pelvic floor constructed One gram of streptomycin powder was introduced in the peritoneal cavity and the abdomen closed in layers The lower end of the rectum and sigmoid were then removed through a perineal wound and the pelvic space drained with a Mikulicz type of drain The patient's postoperative course was slow but uneventful, and the patient was discharged on the twenty fourth postoperative day

Summary and Conclusions

Seven abdominal surgical cases are presented in which there had been contamination of the peritoneum The intraperitoneal use of streptomycin either alone or in combination proved efficacious in the control or spread of peritonitis

---

BUSY BODY

The young woman who entered the pediatric clinic with a small baby complained that the child was taking his breast feeding poorly Our professor thought the case of sufficient interest to call in the entire section He asked the young woman to undress so that each of us—eight in all—could palpate her breasts, noting how underdeveloped and nodular they were After we had finished, he explained to her the course she must follow to improve lactation Only then did she volunteer the information that the child was not hers, but her sister's.—*Medical Economics July 1948*

HYDROLYZED ORAL HAY FEVER ANTIGENS

HENRY M FEINBLATT, M D , F A C P , and EDGAR A FERGUSON, JR ,
Brooklyn, New York

(From the Kings County Hospital and the Long Island College of Medicine)

ORAL treatment of hay fever with pollen extracts has been employed since 1922 Satisfatory clinical results have been reported by several investigators However, large doses of raw pollens have caused gastrointestinal irritation in sensitive patients In such cases the dose that can be tolerated is likely to be below the effective level

This report relates to a process of pollen hydrolysis which permits oral administration in high dosage without any gastrointestinal reaction Various pollens so treated have been given in doses as high as 150 mg to a series of 250 known sensitive patients without a single gastrointestinal upset Therapeutic results compared favorably with injected antigens

Allergic rhinitis was not recognized as a distinct entity until the nineteenth century When first described, hay fever was thought to be due to the sun Later, it was attributed to the aroma from blooming grasses

The first to associate hay fever with pollen was Elliotson From that time on, the disease was attributed to airborne materials, although some physicians still would not subscribe to the idea that pollen was the cause These men were, to some extent, confused by the nature of the various types of allergies Dust, decayed vegetable matter, wind, and heat all came in for a period of blame

It was not until Blackley conducted experiments with fresh and dried pollens from a wide variety of plants that scientific proof of the cause of hay fever was established [1] Blackley made extracts of pollens for subcutaneous injections He also catalogued the various pollens according to their importance in causing hay fever Pollen counts were made at various altitudes

Oral Pollen Therapy

Attempts to relieve hay fever by oral administration of the responsible pollens go back a quarter of a century As long ago as 1922, Touart treated hay fever by ingestion of phenyl salicylate coated tablets containing 0 1 mg of pollen protein [2] Those patients who were sensitive to grass pollen obtained relief A small percentage of sensitive patients improved after treatment with ragweed antigen

The presence of ragweed antigen in the blood and urine after oral ingestion of ragweed pollen extracts was demonstrated by Black [3] He subsequently used oral therapy in a number of sensitive patients and was successful in relieving 80 per cent of those patients who were grass- or ragweed-sensitive [4] Over 75 per cent of the pollen-asthma, orally treated patients showed successful results Thommen cited a satisfactory result in a case with oral pollen therapy [1] He mentioned the variability of absorption after oral administration

Urbach succeeded in alleviating the symptoms of a man who was sensitive to the pollen of the horse-chestnut tree by oral use of pollen peptides of the horse-chestnut [5] Later he reported similar results by the use of peptides made from the entire pollinating flowers [6]

In 1933 Gatterdam reported on oral pollen therapy [7] He elaborated his subject later with a series of 85 hay fever patients treated with pollen orally [8] Eighty per cent were markedly relieved

Bernstein and Kirsner showed that peptic digestion of ragweed pollen (either whole or as an extract) does not destroy its activity [9] This is important as it indicates that pollen may be given by mouth without destruction by the gastric juices

Stier and Hollister observed 383 cases over a period of three years and found that the oral administration of pollen extracts gave about the same results as the hypodermic method [10] They emphasized the ease of administration and wider margin of safety

Hydrolyzed Oral Antigens

When large doses of raw pollen are given to sensitive patients, many will develop symptoms of gastrointestinal irritation When the dose is reduced below the point where gastrointestinal irritation occurs, the dosage level is below the effective level

This difficulty has now been overcome For high dosage, a process of hydrolysis has effectively changed pollen so that in a series of 250 sensitive patients doses as high as 150 mg (150,000 micrograms) have not produced symptoms of gastrointestinal upset in any case

A mixture of hydrolyzed pollens that has been found effective in the great majority of cases is stated in the following formula

Mixed giant and short ragweed, 1,000 Gm (Ambrosia trifida and A elatior)
Orchard grass, 100 Gm (Dactylis glomerata)

Timothy, 100 Gm (Phleum pratense)
Goldenrod, 10 Gm (Solidago)
Pin Oak, 20 Gm (Quercus palustris)
Rye 10 Gm (Secale cereale)

In our studies we also included one pollen of the Chenopodium group such as Botrys (Jerusalem oak), Amaranthus such as spinosus (spiny amaranth), Artemisia such as annua (annual wormwood or sweet mugwort), cultivated aster perennial rye grass (lolium perenne) and Ailanthus (tree of heaven) Approximately 1 Gm of each of the above pollens was included

Regulation of Dosage

For our clinical studies the hydrolyzed pollens were mixed in the proportions mentioned above and divided into tablets containing 10 mg each plus ordinary excipients The 10-mg tablet may be taken as a test dose If no untoward symptoms develop the dose may be increased daily by one tablet per day to a maximum of ten The usual dose is two tablets three times a day

Discussion

Injection therapy has been successful in the treatment of allergic rhinitis and hay fever Due to the increasing use of protein substances for immunization against diseases such as diphtheria and tetanus and the injection of pollen preparations themselves, there is an increasing incidence of sensitivity which interferes with the subsequent use of allergins by hypodermic injection.

In certain individuals symptoms such as vomiting and syncope, occur following the use of hypodermic injections of allergins and other protein-containing media For this reason if a patient is affected with a heart lesion or other serious disease, there has been a reluctance on the part of physicians to administer allergins hypodermically In addition raw oral preparations in high dosage have produced similar toxic manifestations

After ascertaining that the allergins specific to hay fever may be absorbed into the blood stream from the alimentary tract, we found that when the allergin is so prepared and conditioned it does not cause gastric irritation and may be administered orally in large doses with highly satisfactory results and without the difficulties incident to hypodermic injection

Chemistry of Allergins

Allergy producing protein fractions have been separated from ragweed pollen which is the main offender in the United States, causing loss of time from work and discomfort to many people because of the allergic rhinitis it produces.

The main allergy producing fraction from ragweed contains a pentose a flavonol pigment, and two polypeptide molecules [11] The molecular weight of the major antigen is 4 496 as determined by its empiric formula and by its sulfur and carbohydrate content It contains 11.85 per cent nitrogen and 3.33 per cent pentose, and it is a complex molecule Each molecule contains one molecule of the flavonol pigment (isorhamnetin) one molecule of pentose (arabinose) and two polypeptide molecules The two polypeptide molecules contain an aggregate of 28 amino acids and an unusually large percentage of dicarboxylic-amino acids In addition to this large molecular weight antigen four other active antigens have been separated

The second fraction is a quercetrin-dextrose-hexapeptide complex with a molecular weight of 1 168 The hexapeptide consists of monoamino acids

Fraction three is isorhamnetin-rhamnose-tripeptide complex with a molecular weight of 951

Fraction four is an isorhamnetin-rhamnose-tetrapeptide complex with molecular weight of 1 117

All these fractions are immunologically and biologically active. The process of alkaline and acid hydrolysis tends to separate these fractions from the molecule (Table 1) In a manner similar to the preparation of the cardine glucosides

TABLE 1.—EXAMPLES OF THE PROCESS OF HYDROLYSIS

Digitalis	*Hydrolysis* →	Glucose	+	Digitoxigenin
Ragweed

3 3rd Allergy producing Fraction	*Hydrolysis* →	Rhamnose	+	Isorhamnetin Tetrapeptide

TABLE 2.—TYPICAL ANALYSIS

Treated pollens	
Soluble reducing sugars	0 45%
Nitrogen content	2 1%
Protein (N × 6.3)	13 2%
Untreated pollens	
Soluble reducing sugars	0 4%
Nitrogen content	2 1%
Protein (N × 6.3)	13 %

of digitalis into glucose and digitoxigenin when it undergoes hydrolysis, these compounds tend to separate (to an extent determined by the degree of hydrolysis) from their carbohydrate components (Table 2) Mild acid and mild alkaline hydrolysis must be used in order to prevent complete disruption of the allergins

Clinical Series

The purpose of the clinical series was to determine the therapeutic effectiveness of tablets of hydrolyzed mixed ragweed and common pollen and the incidence of gastrointestinal irritation and untoward reactions of an allergic nature caused by this medication

The groups used were unselected cases ranging in age from seven to fifty-nine years, an average of thirty-three and eight-tenths years (average excludes those less than twelve years) The average height was 64 5 inches (excluding those below 60 inches) The average weight of the patients was 139 5 pounds (excluding those below 100 pounds) Most of the patients came from suburban and metropolitan New York City There was one patient from Texas, one from Connecticut, and two from New Jersey Of 60 cases, there were ten children below the age of twelve years The youngest in the group was seven years old The chronic nature of allergic rhinitis is demonstrated by the average duration of the complaint, which was nine and three-tenths years

Specific Sensitivities

The specific sensitivities to the many common allergic materials were determined for each patient They included ragweed, June grass, orchard grass, roses, and dust In addition, food allergies to milk, eggs, fish, pork, chicken, common nuts, and fruits were found

The skin test was performed by making a small scratch, placing a weak alkaline solution on the spot, and adding a small drop of the dilute specific antigen The size of the wheal, the red area around it, and the development of pseudopodia were compared with a test made in the same manner with distilled water instead of the dilute antigen solution

Asthmatic Attacks

Asthmatic attacks sometimes occur seasonally with allergic rhinitis and occasionally also at other times during the year

Many patients had been given injections during previous years The course of treatment of this type usually began eight to ten weeks preseasonally and continued throughout the season Many of our patients had had oral antigen treatment in previous years In every case, our seasonal treatment consisted of giving two tablets three times a day for two weeks before the individual's season began If necessary, the number of tablets given was increased during the actual season

Results

Details of symptoms were tabulated during a period of no treatment The symptoms studied consist of running nose (rhinitis), tearing (lacrimation), skin itch (dermatosensory changes), and sneezing (paroxysmal) The number of days lost from the individual's usual activity was also noted

Running nose that was continuous throughout the day and night was noted as two plus When periods of relief of from four to twelve hours were experienced, it was noted as one plus When the symptom was not present for more than a few minutes per day, it was noted as zero

Tearing that was continuous and caused injection of conjunctival vessels was called two plus One plus represented tearing that was present occasionally Zero indicated that the symptoms were not present

When skin itch was generalized and extreme enough to cause loss of time from work or one's usual activities, it was called two plus Less than this or minor itch was called one plus When absent, it was noted as zero

Violent sneezing interfering with activity was noted as two plus When present in sufficient severity to be mentioned, sneezing was noted as one plus When present only occasionally, it was noted as zero

The same factors were noted for the seasons during which treatment with oral antigen was given and again for the seasons treated with injectable antigens Comparison of symptoms without treatment, with injectable antigens, and with oral antigen therapy is shown in Table 3

TABLE 3.—Evaluation of Symptomatic Relief

Symptom	Before Treatment	After Treatment with Oral Antigen	After Treatment with Injectable Antigen
Rhinitis	1 47	1 47*	1 30*
		0 32	0 73
Lacrimation	1 28	1 28*	1 25*
		0 28	0 50
Skin itch	1 20	1 20*	1 40*
		0 33	0 40
Sneezing	1 40	1 40*	1 43*
		0 20	0 86
Days lost from work	16 90	16 90*	14 40*
		3 80	10 87

* Top figures indicate the number with which to compare the lower average In the case of oral antigen comparison is with the Before Treatment column but with injectable antigen, comparison is with the Before Treatment' group from which cases not treated with injectable antigen have been deleted

Thus it is seen that with oral antigen therapy there was a reduction of 1.15 in the index for rhinitis, 1.00 for lacrimation, 0.87 for skin itch 1.20 for sneezing, and 13.1 days were regained from the lost from work register

With injectable antigen therapy the figures were 0.57 for rhinitis, 0.75 for lacrimation 1.00 for skin itch, 0.57 for sneezing and 3.53 days were regained from the lost-from work register

TABLE 4.—PERCENTAGE INDEX OF BENEFIT

Symptoms	Per Cent Benefited by Antigen Treatment Oral	Injectable
Rhinitis	78	44
Lacrimation	78	60
Skin itch	73	71
Sneezing	86	40
Days lost from work	78	25

Absence of Unfavorable Reactions

The average dose of mixed treated ragweed and common pollens was 85 mg Gastrointestinal irritation urticaria, itch, and increased injection of the conjunctiva (vessels) must be considered as possible ill effects of oral antigen therapy This consideration must be made in comparison with dosage given Carefully charted histories show that, even in cases where extremely large doses were given, gastrointestinal irritation, as indicated by vomiting, diarrhea or loss of appetite, due to administration of the tablets of mixed, treated ragweed and common pollens did not develop in any case of the series There was no case of urticaria, itch, or increased injection of the conjunctiva as a result of the oral antigen therapy

Summary

In a controlled series of hay fever patients treated orally with hydrolyzed antigens, therapeutic results compared favorably with those following the use of injectable antigens in the same cases These findings may be summarized as follows

1 An index of benefit of 78 per cent was found for rhinitis during oral antigen therapy and 44 per cent for injectable antigen therapy, 78 per cent for lacrimation during oral antigen therapy and 60 per cent for injectable antigen therapy, 73 per cent for skin itch with oral antigen therapy and 71 per cent with injectable antigen therapy, and 86 per cent for sneezing with oral antigen therapy and 40 per cent with injectable antigen therapy

2 Percentage decrease in days lost from work was 78 per cent with oral antigen therapy and 25 per cent with injectable antigen therapy

3 There was no instance of gastrointestinal irritation with oral antigen therapy

4 These percentages are based on a controlled series of 35 cases observed over an average period of five years Tables with detailed clinical information have been omitted to conserve space

COST OF THE COMMON COLD

An attempt to arrive at a rough approximation of the cost to the American people of their common colds has been made by the statisticians of the Metropolitan Life Insurance Company who came up with the appalling figure of well over $1,000 000-000 a year This figure was obtained by taking into account the data on incidence of the disease among wage-earners, students and other special groups, according to the studies of many reliable investigators The calculations ran somewhat as follows.

The average person suffers at least two colds a year or approximately 300 million annually for the entire country The average duration of the simple cold is five days, giving a total of one and a half billion days of discomfort decreased efficiency, or disability A conservative estimate of the time lost from work in this country is one day per employee per year or more than sixty million days lost in industry from this cause Even at a low average of $7 00 a day, the result in wages alone is more than $420 000 000 annually

The amount spent on medical care and drugs for the treatment of colds by the average family is impossible to arrive at, but it was assumed to be about $10 00 a year or a total of about $400 000 000 No attempt was made to estimate the cost to employers resulting from the loss of production and disrupted routine, but it, too must reach a considerable figure for the country as a whole

These calculations led the Metropolitan s statisticians to arrive at the estimate of over $1,000 000-000 a year as the cost of the common cold to the American people Although the common cold is generally considered to be a minor illness, they concluded that any disease in which the cost runs to such astronomic figures must be rated high in the list of enemies of the public health —*New England Journal of Medicine October 7 1948*

THE FALLACY OF HYDROCHLORIC ACID INTERPRETATIONS IN GASTRIC SURGERY

EDWARD O FINESTONE, M D , F A C S , New York City

(From Sydenham, Gouverneur, and Harlem Hospitals)

THE advent of vagal neurectomy has strongly emphasized the role of acid secretion in the etiology of peptic ulcer [1] The beneficial effects following vagotomy are in part ascribed to diminished hydrochloric acid secretion [2-4]

Although gastrojejunostomy was originally conceived as a relief from pyloric stenosis, it was performed for many years for peptic ulcer There were several elements in the rationale for this operation (1) it overcame obstruction at the pylorus, (2) by diverting acid gastric contents into the jejunum, it allowed healing of duodenal ulcers, and (3) it diminished gastric acidity by regurgitation of alkaline jejunal contents through the stoma Today, gastrojejunostomy is only employed in pyloric stenosis due to peptic ulcer, and even then, a concomitant vagotomy is usually performed

In the 1920's, when gastrojejunostomy proved to be unsuccessful and a high percentage of cases were followed by gastrojejunal ulceration, gastrectomy became popular At first, partial gastrectomy was done on the theory that the removal of the pylorus, antrum, and lower part of the stomach would eliminate the hypothetic secretagogue, "gastrin," which was supposed to be formed in the mucosa of the pyloric portion of the stomach by the action of hydrochloric acid on the mucosa [5] Gastrin was believed to be absorbed into the circulation and carried to the fundus and body of the stomach where it stimulated renewed secretion of hydrochloric acid

Gastric surgeons criticized their colleagues or associates for their poor results and blamed the poor results on the inadequate resection of the stomach Thereupon, each surgeon attempted to remove more and more of the stomach, so that ultimately, the operation was considered correctly performed only if it fell into the category of being a "subtotal gastrectomy"

Heuer and his colleagues found that a reduction in acid secretion occurred after resection, depending on the extent of the resection [6] They concluded, however, that resection of any magnitude consistent with a reasonable mortality does not insure achlorhydria Moreover, the clinical result of resection could not be correlated with a change in acidity, since, of 90 per cent of the patients who had satisfactory results from the operation, only 25 per cent had a reduction in acidity They were of the opinion that, if their observations were confirmed by others, the idea of insuring achlorhydria by larger and larger resections would appear to be of doubtful value

Even today, in the largest gastrointestinal clinics throughout the country, subtotal gastrectomy is done in the hope of abating the acid-producing mechanism When partial gastrectomy fails, recurrences of gastrojejunal ulcers are treated by repeated higher and higher resections, and ultimately total gastrectomy is attempted

Nevertheless, it is very doubtful whether there is any specific "gastrin" mechanism [8] Experimental laboratory support for this theory seems to fall down under more careful scrutiny It is now believed that the effects observed were due to histamine, which was probably the substance obtained when extracts were made of the pylorus for intravenous injection [8] Therefore, at present, although there is no adequate theoretic rationale for pyloric resection for the purpose of reducing gastric acidity, it is well established from clinical observation that the operation often produces this effect

> It can safely be said that a reduction of acidity may be expected to follow in most cases of resection for gastric ulcer In the case of duodenal ulcer, however, the effect on acid secretion is problematic, to say the least [7]

How can we reconcile this paradox? I believe the fault lies in the conception of gastric surgeons and gastroenterologists in the appraisal of gastric acidity Irrespective of the type of operation performed for peptic ulcer, the chief criterion for evaluating the results of operation, aside from clinical improvement, has been the creation of diminished gastric acidity Whether gastrojejunostomy, pyloroplasty, pylorectomy, partial or subtotal gastrectomy or vagotomy, or any combination was performed, the good results were attributed to the diminution or complete cessation of acid production When the clinical results were good and relatively low acid figures were found, the operation was hailed as physiologically correct On the other hand, the failures, even in the presence of anacidity, were not so easily explained

> Kiefer showed from a study of 141 patients that 68 per cent showed no free acid in a single forty-five minute specimen after an Ewald test meal following resection However, when hista-

mine was used, 16 out of 123 patients with a negative response to the Ewald meal were found to have free acid. He concluded that the secretion of free acid persists after subtotal gastrectomy in an appreciable number of cases provided the stimulation is adequate. Jordan and Kiefer have emphasized the importance of securing fractional specimens for at least two hours with the patients lying flat in the supine position with the tip of the tube in the resected stomach if accurate values of acidity are to be obtained.[7]

The fallacy of seeking anacidity lay not in the choice of surgical procedure but in the interpretation of the hydrochloric acid determinations. No matter whether fasting gastric contents, gruel tests, night tests, insulin histamine or any other method was employed the aspirated gastric contents have been almost exclusively examined only for free hydrochloric and combined acid. The failure to examine the aspirated material for total chlorides has led to a serious misconception of the end results in gastric surgery.

Earlier efforts to evaluate intragastric neutralization based on the ratio of neutral to total chlorides (the chloride index) have been far less successful than the neutralization test and very little use has been made of this procedure.[8] Of late, investigators have come to the conclusion that reduction of gastric acidity is due to dilution by the admixed substances as well as to neutralization.[10 11]

The main constituent of gastric secretion is hydrochloric acid, which is primarily formed in the fundus and body. However, it is also formed in the pyloric region. The exact means by which it is elaborated is unknown. Its main function is to activate pepsin. Whether rennin exists as a separate ferment is disputed, since it is believed to be identical with pepsin.

The total chlorides of the gastric juice consist of three components: free hydrochloric acid, combined hydrochloric acid, and inorganic chlorides. Inorganic chlorides are either secreted in this form by the gastric mucosa, or they result from the combination of gastric, free hydrochloric acid with regurgitated duodenal or jejunal content (in the case of gastrojejunostomy). There is an inverse relationship between the concentration of acid and base in gastric juice.[12 13] The relative proportion of chlorides among the three forms varies according to the amount of protein ingested, the amount of regurgitation through the pylorus or gastrojejunostomy, and other factors.[14]

The concentration of hydrochloric acid in the stomach content at any given time will depend upon many varying factors. Among these may be mentioned the total blood electrolyte concentration, the state of dehydration or hydration, the activity of the blood supply to the stomach, the amount of water absorbed from the stomach, the rate of stomach emptying, the amount of diluting juices from the mouth and small intestine, the activity of the vagus and splanchnics and of humoral gastric secretagogues.[15]

Therefore, under any circumstances the total chlorides are the truest indications of the total hydrochloric acid secreted.[14 16]

Aspirated gastric contents consist of gastric secretions in addition to saliva and regurgitated duodenal or jejunal secretions containing pancreatic juice and bile. Normally, fasting total acidity is between 0.45 and 0.60 per cent and free hydrochloric acid is 0.4 to 0.5 per cent. One to two hours following test meal, free hydrochloric acid falls to 0.1 per cent. This fall is accompanied by a proportional rise in the inorganic chlorides. This is explained by the regurgitation of alkaline duodenal contents in the latter stages of gastric digestion.[16 17] If the pylorus fails to remain patent between gastric peristaltic waves, the curve of gastric acidity climbs steeply. If the pylorus opens too early, the amount of free hydrochloric acid in the aspirated contents is low or absent. However the amount of inorganic chlorides increases inversely. This situation is usually found in atonic stomachs.

It is now evident that gastric acidity depends not only upon the amount of acid secreted, but also upon the action of the pylorus or the gastrojejunal stoma together with the motility of the stomach. The latter factors influence the extent of regurgitation of alkaline juices.[16–18]

This conception of estimating the *total* chlorides rather than free and total hydrochloric acid alone is not new.[8 16] However, the writer feels that in their ardent zeal to achieve anacidity surgically surgeons and their associated gastroenterologists have forgotten this basic physiologic truth. When one listens to extended presentations and discussions at gastrointestinal conferences where acid figures are tabulated at great length but no mention is made of *total* chlorides in gastric contents the obvious conclusion is that the results of gastric surgery are being seriously misjudged.

Conclusions

1. All forms of surgery for peptic ulcer alter gastric motility.
2. Regurgitation of duodenal or jejunal juices are partly responsible for low acid figures by neutralization.
3. Only estimation of total inorganic chlorides will give a true indication of the acid gastric secretion.
4. The present method of reporting acid figures following gastric surgery is misleading.
5. Newer methods for determining the effects

of gastric acid secretion and motility are needed, rather than newer technics of gastric surgery

RADIOGRAPHIC PNEUMOPERITONEUM IN ACUTE PERFORATIONS OF THE GASTROINTESTINAL TRACT

STANLEY A KORNBLUM, M D , Monticello, New York

(*From Mount Sinai Hospital*)

THERE have been numerous conflicting reports concerning the incidence of pneumoperitoneum in perforations of the gastrointestinal tract since 1915 when Popper first suggested the use of roentgenography as an aid in its diagnosis [1] Various authors have reported figures ranging from 43 5 per cent to 100 per cent since then [2–5] However, almost all of these statistics are based on experiences with perforations of the stomach and duodenum

I have surveyed all of the cases of perforation of the gastrointestinal tract from 1933 to 1945, which were admitted to the ward services of the Mount Sinai Hospital, in an effort to obtain the following information (1) incidence of perforation of the different divisions of the gastrointestinal tract, (2) incidence of the x-ray finding of pneumoperitoneum in proved cases of perforations of the different divisions of the gastrointestinal tract, and (3) whether the factors of time or size of the perforation influence the finding of pneumoperitoneum radiologically In the thirteen-year period covered by this report, there were 322 cases of acute perforations of the gastrointestinal tract proved by operation or autopsy Of this number only 87, or 27 per cent, had x-ray studies (Table 1)

The incidence of perforation of the various portions of the gastrointestinal canal in the order of frequency was as follows appendix, stomach duodenum, large bowel, and jejunum and ileum This finding is essentially in accord with that of Abbott [6]

Of the 322 cases included in this report, 141, o

TABLE 1 —322 ACUTE PERFORATIONS OF GASTROINTESTINAL TRACT

Anatomic Site	Number of Cases with Perforations	Per Cent of Total	Number of Total X rayed	Per Cent of Total X-rayed	Number of Positive X-rays	Per Cent of Positiv X-rays
Stomach	66	20 5	27	40 9	16	59 3
Duodenum	62	19 3	27	43 5	19	70 4
Jejunum and ileum	26	8 1	8	30 8	3	37 5
Appendix	141	43 8	14	9 9	1	7 1
Large bowel	27	8 3	11	40 7	7	63 6
Total	322	100 0	87	27 0	46	52 9

43.8 per cent, were perforations of the appendix. Of these 141 cases, 14, or 9.9 per cent had x ray studies for pneumoperitoneum. A positive finding was present in only one case, that of a fifty-four year-old man with a five-day history. In an analysis of this group that had had x ray studies, it should be noted that only two patients were under thirty years of age. Apparently the perforation of a viscus other than the appendix was suspected.

Other authors have also reported cases of pneumoperitoneum in perforated appendix.[4,7,8] It is not widely recognized that this can occur, and no large studies of the incidence of this finding have been recorded in the literature. From this small series one must conclude that it is unusual. The probable reasons for the infrequency of intraperitoneal air in perforated appendix are, first, the smallness of the lumen which becomes occluded by the inflammatory exudate and second, the fact that the appendix not uncommonly lies retrocecally.

Of the 66 cases involving the stomach only 27 were examined by x ray, and of these 27 16 were of pneumoperitoneum. However, all cases with duodenal involvement with a duration of symptoms of more than twelve hours before x ray studies were undertaken showed the characteristic findings of intraperitoneal air. This conforms with the conclusions of Levine and Sohs-Cohen namely, that the greater the time interval the greater the likelihood of positive findings and the greater the accumulation of air.[12] Johnson however opposes this view, claiming that the chances of obtaining roentgen evidence of pneumoperitoneum are best soon after the acute episode.[9]

There were 27 cases of large intestinal perforations of which 11 were studied by roentgenologic methods. Of these seven had evidence of air intraperitoneally, a frequency of 63.6 per cent. It is interesting to note that of the seven positive cases five were due to trauma and two were secondary to ulcerative colitis, whereas of the four negative cases two occurred in malignant neoplasm and two in diverticulitis. In view of the small size of this series one cannot draw any inferences as to the relationship of time, size, and

TABLE 2.—COMPARISON OF POSITIVE AND NEGATIVE X RAYS

Anatomic Site	Number of X-rays		Average Number of Hours of Acute Episode Prior to X ray Study		Extremes of Time Hours		Average Size of Perforation Recorded at Operation or Autopsy (Cm.)		Extremes of Size (Cm.)	
	Positive	Negative	Positive	Negative	Positive	Negative	Positive	Negative	Positive	Negative
Stomach	16	11	0	19.8	2-72	9-180	0.8	1.0	0.3-1.5	0.3-3
Duodenum	19	8	31	5.5	1-192	1-12	0.5	0.6	0.2-1.0	0.1-2.0
Jejunum and ileum	3	5	10.6	19	1-30	1-48 6-168	1.2	1.4	0.5-2.0	0.2-3.0
Appendix	1	13	108	64		1-72				
Large bowel	7	4	2.5	2..	0.5-6					
Total	46	41								

positive a frequency of 59.3 per cent. This figure is lower than that usually reported.[2,4,6,7,9] Analysis of these cases with positive and negative roentgen findings revealed no significant data as to either the duration of perforation before x ray study was done or the location or the size of the lesion (Table 2). In this series the cause of all gastric perforations was benign gastric ulcer. It was also noted that in none of the cases studied roentgenographically did the perforations occur on the posterior wall of the stomach.

With reference to the duodenum all perforations but one were secondary to benign ulcer. There were 62 cases of perforation, of which 27 were x rayed. Of these 27 19 were positive, a frequency of 70.4 per cent which is perhaps a little lower than that usually reported.[4,9] Analysis of this group did not allow one to draw any inferences with respect to the size and the location of the perforation in affecting the frequency of location of perforation to pneumoperitoneum with any degree of accuracy.

There were 26 cases of perforations of the jejunum and ileum in this report of which eight had x ray studies. Of this number three were positive, an incidence of 37.5 per cent. Again one has too few cases to draw any significant conclusions.

Discussion

All the cases included in this report were of acute onset or had an acute episode during their illness with the physical findings of the so-called 'acute abdomen.' Klingenstein and Tuchman reported some of the cases in this series that occurred during hospitalization.[11]

Any means of making a diagnosis of perforation of the gastrointestinal tract would be a great aid and would tend to lower the incidence of operations now performed for acute abdominal conditions. It has been shown experimentally on

lem—why some men become excessive drinkers and why excessive drinkers become addicts"*

This research can best be carried out through the establishment of clinic hospital units Such a unit will be soon set up as a demonstration under the auspices of the New York State Department of Health, the New York State Department of Mental Hygiene, and the Medical Society of the State of New York

The School of Medicine of the University of Buffalo has assumed the responsibility for the administration of such a demonstration unit, and, with the active cooperation of the hospitals connected with the medical school and the local Alcoholics Anonymous along with the Council of Social Agencies and its component agencies, rehabilitation and research material of value should be obtained

We must ever keep the following concepts in mind if we are to succeed

1 Alcoholism, or problem drinking, is a disease, and the problem drinker is a sick person

2 The problem drinker can be helped and is worthy of help

3 This is a public health problem and, therefore, a public responsibility

SCIENTIFIC EXHIBITS
1949
ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to the Chairman of the Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss
505 State Tower Building
Syracuse 2, New York

The Annual Meeting will be held May 2 to 6, 1949, at the Hotel Statler in Buffalo

No applications can be considered after January 1, 1949

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

ADOPTION IN NEW YORK CITY

To supply a comprehensive study of the adoption situation, the New York Academy of Medicine, the United Hospital Fund of New York and the Welfare Council of New York City in 1946 jointly appointed the New York City Committee on Adoptions to make a broad inquiry into adoptions and related services. The report of this Committee has just been published by the Welfare Council

Thirty-seven public and private agencies working in the New York City adoption field and the social service departments of 11 hospitals participated in the report. Miss Katharine F Lenroot, chief of the Children's Bureau of the Federal Security Agency said, in her foreword to the report that the recommendations taken together represent an approach to adoption not as a problem for social work alone, or law or medicine or any separate professional group but rather as one for action by the whole community

The report is chiefly concerned with a study of the services in New York City and philosophy and conditions of adoption practice Conceding that approved facilities for adoptions in New York are inadequate the Committee agrees that the important process of adoption should be handled through authorized agencies chartered by the State and subject to inspection and supervision by the State Department of Welfare Of particular interest to the medical profession was the recommendation that the medical legal nursing, social work professions and the clergy be requested to study questions of ethical practice in relation to the care of unmarried mothers and the placement of children in adoption with a view to informing members directly as to accepted procedure and the use of authorized agencies

The report pointed out certain weaknesses in the law which, at the present time does not penalize or forbid such unethical practices as the placing of children for adoption at a price The committee has asked that certain principles be incorporated in the law namely notification of an appropriate public agency by persons who have taken a child for adoption within two weeks after they receive the child in their home prompt investigation by an appropriate social agency of the placement of a child in a prospective adoption home and requiring investigation before the adoption becomes final in the court. The committee also asks for legal procedures for the termination of unsatisfactory placements and of course, prevention of placements of children for private profit.

HOSPITAL NEWS

1948 Directory Shows Growth of Hospitals

THE almost 18,000,000 Americans admitted into the 6,173 hospitals of the United States in 1947 represent nearly a 100 per cent increase over the 9,221,517 patients admitted to hospitals in 1937, ten years ago These figures, along with many others illustrating the increased recognition of the place of hospitals in the nation's health and welfare, appear in the 1948 *American Hospital Directory*

According to the statistics, last year one in every eight Americans received hospital care Approximately 16,000,000 patients, 2,000,000 more than in 1946, were admitted to general hospitals in 1947 Rising prices left their mark, as the average cost of caring for a patient for one day in a general hospital jumped from $9 39 in 1946 to $11 09 in 1947, leaving a daily deficit of $1 38 per patient

Hospitals spent about $400,000,000 more in 1947 than in 1946, due to higher wages, higher prices, and expanded services It is significant that the average patient entering a general hospital last year stayed for only eight days, as compared to 9 1 days in 1946 The Association concludes that this shorter hospital stay results from the increasing tendency of patients to enter hospitals in earlier stages of illness, as well as from wider recognition of the value of hospitals, improved treatment methods, and early ambulation

Building Work at 31 Hospitals to Get U S Aid

CONSTRUCTION projects for 11 hospitals in the metropolitan New York area, estimated to cost $2,753,411, and for 20 upstate hospitals, estimated to cost $15,832,613, were approved for Federal aid by the State Joint Hospital Survey and Planning Commission in Albany on November 20

Dr John J Bourke, commission director, said Federal grants would amount to about a third of the total cost. The remainder will be borne by the projects' sponsors

Slated for the most aid in the New York area is the Wyckoff Heights Hospital, Brooklyn, where the addition of a 100-bed wing is estimated to cost $1,501,000 A $700,000 thirty-six-bed addition to the Jamaica General Hospital, Jamaica, Queens, and a $241,450 forty-bassinet nursery for Mount Sinai Hospital, have also been approved

Other projects approved for the New York area are a $34,492 sixty-bassinet nursery for Kings County Hospital, Brooklyn, a $14,766 sixty-bassinet nursery for Harlem Hospital, a $15,968 twenty-four-bassinet nursery for Queens General Hospital, Jamaica, Queens, a $15,868 thirty-two-bassinet nursery for Fordham Hospital, the Bronx

Also, a $7,987, twenty-five bassinet nursery for Lincoln Hospital, the Bronx, a $55,000, twenty-bassinet nursery for Presbyterian Hospital in the City of New York, and a $29,280 thirty-five-bassinet nursery for Bellevue Hospital

The thirty-one projects were selected to make up the first and second years goal for a five-year, Statewide construction program that the commission recommended in a report issued last June The commission estimated that the long-range program it recommended would cost approximately $750,000,000 and would provide 54,000 additional hospital beds

Construction of new general hospitals and additions to existing plants constitute the majority of the projects Alterations to existing hospitals to provide nurseries for premature newborn infants, construction of several public health centers and laboratories, and modernization of some hospitals throughout the State make up the remainder of the projects

NEWS NOTES

Mount Sinai Hospital, New York City, has announced the appointment of Dr Sidney M Samis as assistant director Dr Samis, who has served in administrative posts at Montefiore Hospital and the Union Health Center in New York, was a Medical Corps captain during the war

The cornerstone of a new $1,100,000 building at Hillside Hospital, which will increase the capacity of the hospital from 88 to 172 beds, was laid October 24 by Leon Lowenstein, a vice-president of the hospital, on its grounds at Bellerose, Queens At the same time affiliation of Hillside Hospital with the Federation of Jewish Philanthropies of New York was announced

Tumor clinics attached to six Buffalo area hospitals are cooperating in the nation-wide effort to arrest cancer With better diagnosis and treatment of cancer patients as their goal, the clinics are among more than 400 scattered throughout the United States which conform to the standards set up by the American College of Surgeons They are located at Meyer Memorial, General, Our Lady of Victory, Millard Fillmore, Children's, and Mercy Hospitals

Dr Cameron Guild, formerly on the staff of the National Tuberculosis Association in New York City, and for the past year with the medical section of the Veterans Administration, has been appointed to the post of chief of professional services at Sunmount Veterans Hospital in Tupper Lake

Dr William H Shehadi, formerly director of radiology at Mount Vernon Hospital, Mount Vernon, has accepted the position of professor of radiology and director of the department at New York Polyclinic Medical School and Hospital in New York City

Mrs Albert A Rosenberg, president, presided at the meeting

Erie County

A Christmas tea to welcome new members was held by the Erie County Woman's Auxiliary on December 14, with a large Christmas tree and gifts for each guest of honor featuring the decorations A musical program was presented In charge were Mrs Joseph A Zavisca, membership chairman, and Mrs Charles A. Schuder, house and hospitality chairman

Other recent activities of the group include a dessert bridge and fur style show on October 28 for the benefit of the nurses' scholarship fund, with Mrs Norman F Graser, program chairman, in charge, a November luncheon with a harvest theme, and a class in parliamentary law procedure for board members, which began on October 20

Kings County

At the November meeting of the Kings County Auxiliary, held November 9 following a buffet luncheon, Mr Thomas E Walsh, field representative from the Public Relations Bureau of the State Medical Society, was the guest speaker

The annual bridge of the Auxiliary was held on October 26, with Mrs Charles E Robinson as chairman The Auxiliary was represented at the fall board meeting in Syracuse by Mrs Edwin A Griffin, Mrs Clifton L Dance, and Mrs Charles E Scofield, president

Onondaga County

Mr Thomas E Connolly, recently appointed executive secretary of the Onondaga County Health Association, addressed the members of the Onondaga County Auxiliary at their meeting held November 9 in Syracuse His topic was "The Function of the Onondaga Health Association" Mrs William J Ryan was chairman of the social hour which followed Mr Connolly's talk

Queens County

Installation of officers for the Queens County Auxiliary was held December 7 at the Gramercy Park Hotel, with Mrs Meyerson Coe as installation officer Guest speakers were Mrs Edgar M Neptune, State auxiliary president, Mrs Luther H Rice, national auxiliary president, and Mrs Clifton L Dance, second district councilor

Officers installed included Mrs Samuel Klein, president, Mrs Frank Lo Presto, president-elect, Mrs Evan McClave, vice-president, Mrs John De Hoff, secretary, Mrs John Finnegan, treasurer, Mrs William Flanagan, assistant treasurer, Mrs Harry Secky, historian, and Mrs Patric De Cano, Mrs Gustin Kiffney, Mrs John Mauro, Mrs Harold Forster, Mrs John Scannell, Mrs Joseph Hallinan, Miss Adele Hallinan, and Mrs William C Bronx, district representatives

Rensselaer County

The annual membership tea of the Rensselaer County Auxiliary was held October 26 in Troy Guests of honor included Mrs Albert Vander Veer, third district councilor, and Mrs A M Yenich, president of the Albany County Auxiliary

The quarterly bulletin of the Rensselaer County Auxiliary, *The Marc*, celebrated its first year of publication in October Heading the editorial committee are Mrs Samuel Werlin, Troy, and Mrs. John J Noonan, Watervliet

Richmond County

Projects for the year were discussed at the meeting of the Richmond County Auxiliary, held November 16 at the Richmond Memorial Hospital, with the program in charge of Mrs Lawrence Viola

The first meeting of the year was held September 21 at the Staten Island Hospital, with Mrs Joseph Worthen presiding Standing committees were appointed, and the members agreed to continue work in the offices of the Staten Island Tuberculosis and Health Association and of the Staten Island Cancer Committee

Schenectady County

The Schenectady County Auxiliary held its first meeting of the season October 26 at the Mohawk Golf Club, Schenectady, with 56 members present at the luncheon session Dr Nelson Rust, president of the Schenectady County Medical Society, addressed the group

Presiding at the meeting was Mrs Gomer Richards, president Committee reports were given, and the group voted to raise funds for a nurses' scholarship

On November 11, Dr Louis H Bauer, secretary of the World Medical Association, addressed a joint dinner meeting of the Auxiliary and the Schenectady County Medical Society, at the Hotel Van Curler in Schenectady

---

THE LADY OR THE TIGER?

A Londoner, not feeling very well, went for free medical care under the new Health Scheme Entering the clinic, he saw an arrow which pointed down a long corridor He followed it until he came to two doors, one marked "Female," the other "Male" Going through the latter he found himself in another long corridor at the end of which were two more doors These were marked "Under 35" and "Over 35" He chose the right one which opened into still another lengthy corridor, which again ended with two doors These were marked "Conservative" and "Labor" As a Conservative, he chose the former, walked through it, and found himself—in the street—*New York Times, November 14, 1948*

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

AT ITS meeting on October 14, 1948 the Council *considered the following matters* taking action as indicated

Secretary's Report

Remission of State Assessments—Remission of State assessments was voted on account of service with the armed forces for one member for 1947 also on account of illness for Julia R. Gibson for 1947 and 1948 Joseph Tennenbaum for 1948 Sidney H Saffer for 1948 and Alexander A Stone for 1948 all of Kings County Doctors William J Roswig and Henrietta C Christen had their War Memorial assessments remitted due to illness

Meetings—Since our last meeting your Secretary attended six district branch meetings. At the meeting of the Fourth District Branch, Saratoga Springs September 24, I addressed the meeting on Paging the Medical Society of the State of New York.'

Your Secretary also attended the funeral of our trustee, Dr Albert A Gartner at Buffalo on September 11 A letter of condolence was sent to Mrs. Gartner as directed by you

Your Secretary attended the dinner of the 34th annual convention of the International Association of Industrial Accident Boards and Commissions at the Hotel Commodore New York City September 14 Present also were Dr Fenwick Beekman, Dr Edward R. Cunniffe, Dr Harry Golombe Dr Chas Gordon Heyd Dr David J Kaliski, Dr J Stanley Kenney, Dr John J Masterson and Mr Thomas E. Walsh Dr Joseph Raphael member of the Medical Practice Committee of the New York State Workmen's Compensation Bureau sat at table with us.

The trustees of the Medical Society of the State of New York have directed me to notify the Council of the necessity for all bureaus, committees and individuals connected with the Society to keep within the 1948 budget owing to the financial condition of the Society

On his way to the Seventh District Branch Meeting at Canandaigua, your Secretary inspected the physiotherapy department at Ithaca College

Your Secretary takes the liberty to suggest that the Board of Trustees be requested to renew Dr Robert R. Hannon's, Dr David J Kaliski's and Mr George P Farrell's contracts with the Society

The New York State branch of Selective Service sent a request to our Society for nominations for appointments to certain local Selective Service Boards Your Secretary has written to the secretaries of the appropriate county medical societies requesting nominations He respectfully requests approval of this action including transmission of such nominations to the Albany office of Selective Service

Communications—1 Letter from Dr Irving L. Ershler secretary of Onondaga County Medical Society, to Dr Anderton September 30 1948 which in part states

> This Society has received a contribution of $24 from St. Joseph Hospital Syracuse, for th proposed War M morial established by the State Society At its regular meeting this week, our Comitia Minora directed me to find out from you if this spontaneous contribution in the name of St. Joseph Hospital will be acceptable.

Dr Anderton stated he had inquired of Counsel whether there was any reason why the Society should not accept money for this purpose and he stated there was not

A vote of thanks was extended in the name of the Society to St Joseph Hospital Syracuse for its donation to the War Memorial Fund

2 Annual letter from the president of the Physician's Home Dr Chas Gordon Heyd requesting the Council to nominate 20 candidates for the Board of Directors of the Physician's Home

It was voted that the Council nominate to the Board of Directors of Physician's Home the following Max Einhorn B Wallace Hamilton Chas Gordon Heyd Beverly Chew Smith George T Strodl Seymour Wimpfheimer J Miller Walker O Shepard Krech Edwin P Maynard Jr Frederic W Holcomb Maynard C Wheeler Everett C Jessup Scott Lord Smith Denver M Vickers, Edward T Wentworth, Douglas Quick, W Guernsey Frey Jr Louis H Bauer Conrad Berens and Herbert H Banckus

3 Letter from Miss Clara Quereau, secretary of the Board of Examiners of Nurses of the Department of Education of the State of New York to Dr Anderton, September 27 1948

> Under the provisions of the Nurse Practice Act of th Education Law, two or more nominations f r a vacancy on the Nurse Advisory Council to be filled by a representative of the Medical Society of the State of New York shall be submitted to the Department on or before November 1 of any year by the Medical Society
>
> The term of Dr Clayton W Greene, Buffalo as a m ber of the Council expires December 31 of this year Advisory Council members are appointed for a term of three years If the Medical Society wishes to recommend the renomination of Dr Greene, it will not be necessary to ubmit his biography since this is already on file. How ever a biographical sketch should be included for the alternate nominee.

After discussion, *it was voted* that the Council of the Medical Society of the State of New York nominate to the Board of Regents of the University of the State of New York Dr Clayton W Greene of Buffalo and Dr W Guernsey Frey Jr of New York for membership on the Nurse Advisory Council

4 Letter from Mrs. Edna C Gartner October 11 1948 expressing appreciation for the Society's condolences was read.

5 Letter from the Deputy Commissioner of Health of the State of New York Dr Hollis S. Ingraham dated September 30 1948 addressed to Dr Simpson

> At Dr Hilleboe's suggestion I am writing to you in regard to rearranging of Medical Society districts, about which he spoke to you by teleph ne recently
>
> The districting of our own Health Department has recently been rearranged so as to incorporate six regions, each under the head of a regional director The attached map indicates the boundaries of these regions.
>
> The delineation of these regions was based on several considerati ns the most important f which was the desire of the Department to maintain close contact with the teaching hospitals and medical schools of the State This is particularly important in relation to the administration of the medical services of the Department. Consideration was also given to the natural flow of the population with regard to distance and transportation facilities, and the Department was guided in this matter by the Marketing Map of New York as prepared by the Hearst Magazines Inc. and to the existing movement of the population with

respect to medical services based on the place of hospitalization of cancer patients

It is also to be noted that the New York State Commission on Medical Care suggested similar districts and primary centers for hospital service, as did the New York State Health Preparedness Commission Also the districts of the New York State Department of Social Welfare follow this same outline Each of the above varies only by the inclusion or exclusion of a few counties

In general we believe that the regionalization as depicted here will prove to be of continuing value to our Department and from our point of view the redistricting of the State Medical Society along the same lines would prove definitely helpful to us in our various joint endeavors There are, of course a number of aspects of the matter from the point of view of the Medical Society which we are in no position to evaluate and we are merely suggesting that since redistricting is now being considered, this general outline be brought under discussion

If you deem it desirable and Dr Kenney concurs I should be very happy to meet with the Committee and present more details regarding this proposal

It was voted that this be referred to the Planning Committee for Medical Policies

6 Letter from Dr Simon Strauss, retired member, requesting that he be recommended for Associate Fellowship in the American Medical Association

It was voted that he be so recommended

Secretary's report was accepted, and its recommendations were voted

Treasurer's Report was accepted

Report of Executive Officer

Dr Hannon reported verbally as follows

The Executive Officer has attended district branch meetings, which have all been completed but two, which will be held during the next two weeks

The office in Albany has been busy preparing for the legislative session of next year Many different bills have been proposed

One of the suggested bills to come before the next Legislature is from the Board of Regents in regard to rescinding or amending the Education Law, Chapter 211 I think it is, that pertains to the endorsement of licenses or the granting of a license without examination This suggestion has come from them, I think, because of the difficulties they have had along that line in the past

I have been instructed to attend a meeting tomorrow afternoon in Albany regarding proposed legislation for enforcing the inclusion of iodine in table salt I have been collecting opinions on that, and so far the consensus of opinion seems to be that it would be unwise to make it compulsory to add iodine to all salt sold in New York State If there are any expressions otherwise from members of the Council, I would appreciate having them before tomorrow

I have been having correspondence with Senator Desmond on the proposed amendment to the law requiring premarital health certificates We have been instructed by the House of Delegates to advocate a bill shortening the time

We are working on many proposed bills, and I would appreciate very much if anyone that has material or suggestions regarding these proposed legislative matters would send them to my office as early as possible

Activities of Committees

Economics —Mr Farrell, director of the Bureau of Medical Care Insurance, made the following report

During September, Mr Farrell attended the Fifth, Sixth, Seventh, and Eighth District Branch meetings and, at the Sixth District meeting in Binghamton, served as moderator at a round-table discussion on Prepayment Medical Care Papers were presented by Dr Wertz, Dr Leo Gibson, and Dr John F Kelley on why doctor participation is necessary for the success of a medical care plan, how the Central New York Medical Plan serves the doctor and the public, and why Medical and Surgical Care of Utica has the largest member participation of any plan in the State in relation to Blue Cross subscribers

September 21 Mr Farrell was present at a stated meeting of the Medical Society of the County of Westchester in White Plains A discussion of United Medical Service was presented by Mr John McCormack, executive vice-president, Dr F E Elliott, medical director, and Mr Fred Newell, enrollment supervisor of the plan

September 23 Mr Farrell attended a meeting at the Waldorf-Astoria for the discussion of proposals for a Blue Cross-Blue Shield Association and Blue Cross-Blue Shield Health Service, Inc , called by the director of the Hospital Service Plan Commission and the director of Associated Medical Care Plans, for districts II and III, representing the states of New York and New Jersey Dr Paul R Hawley, chief executive officer of Blue Cross-Blue Shield Commission, explained the proposals Following the meeting Mr Farrell summarized these proposals, with comments, for distribution to New York State plan presidents

Summary and Comments

PROPOSALS FOR A BLUE CROSS-BLUE SHIELD ASSOCIATION AND BLUE CROSS-BLUE SHIELD HEALTH SERVICE, INC

The proposals have been approved by the Joint Commission of Blue Cross and Blue Shield and by each Commission separately

They have been accepted by American Hospital Association and Board of Trustees of American Hospital Association

Proposals will be discussed and voted upon at the Annual Conference of plans in French Lick Springs, Indiana, October 25 to 28, 1948

The purpose of proposed Blue Cross-Blue Shield Association is to supplement the activities of both Commissions, to establish a national agency "to provide protection against the cost of health service for employes of employers operating in a territory or territories not fully covered by a single plan," and to act as the agent of each plan in soliciting the employes residing in the territory served by such plan as subscribers to each plan's subscription certificates and in collecting the subscription rates payable thereunder, to provide protection against the cost of such health service as is not included in the benefits offered by the plan otherwise serving such employes, and provide protection against the cost of health service to employes residing in any territory not served by a plan The agency shall not in any event offer or provide to any such employes protection against the cost of any health service which is included in the benefits which a plan is willing to provide

Membership —Each person who is a member of the Blue Shield and Blue Cross Commissions automatically becomes a member of the corporation A bicameral system of voting applies on all questions except in the election of governors

A board of governors shall manage the affairs

of the corporation There shall be 30 in number 15 Hospital Governors and 15 Medical Governors of which three are representatives of the American Hospital Association and three are representatives of the American Medical Association

A majority of the members of the board of governors shall constitute a quorum for the transaction of business and majority vote shall be the act of the board and not the bicameral system of voting

It is proposed to establish a Blue Cross-Blue Shield Health Service Inc. which will be a stock insurance company

The amount of capital of the company shall be $333 100 represented by 3,430 shares divided into two classes, namely 3 330 preferred shares of the par value of $100 per share and 100 common shares of the par of $1 00 per share. Preferred shares shall be issued at $150 per share of which $100 per share shall be allocated to capital and $50 per share shall be allocated to paid in surplus Common shares shall be issued at $5 00 per share of which $1 00 per share shall be allocated to capital and $4 00 per share shall be allocated to paid in surplus

It is contemplated that preferred shares will be purchased at $150 per share with funds to be furnished by contributing plans If all shares are so purchased, the corporation will have a capital and paid in surplus of $500 000 The preferred shares shall not be entitled to any dividends and all net earnings will be used to redeem the preferred shares at their issue price In order that contributing plans can act together it is also intended that the preferred shares will be placed in a voting trust under which the trustee will vote only as directed by the contributing plans. By the terms of the voting trust agreement, the trustee is to elect ten of the fifteen directors

The common shares will be purchased and held by the Association Until the contributed capital has been returned by the redemption of the preferred shares the Association will elect five of the fifteen directors. Thereafter the Association will completely control the Health Service Inc. through the ownership of all outstanding shares and will be entitled to receive all earnings

The corporation has been organized and shall be operated solely for the purpose of supplementing medical care and hospital care benefits which voluntary nonprofit hospital or medical care plans may from time to time be willing to provide and to assist plans in serving the employes of employers operating in a territory or territories not fully covered by a single plan In serving these employes, this corporation shall to the extent permitted by law use its best efforts to induce the employes residing in a territory served by a plan to become subscribers to the subscription certificates issued by such plan and to assist such plan in collecting the subscription rates payable thereunder provide protection in the form of indemnity or otherwise against the cost of such hospital, medical, or other health care as is not included in the benefits offered by the plan otherwise serving such employes provide protection in the form of indemnity or otherwise against the cost of hospital medical, or other health care to employes residing in any territory not served by a plan This corporation shall not in any event offer or provide to any person protection against the cost of any health service which is included in the benefits which a plan is willing to provide to such person The protection so provided by this corporation to persons residing in a territory otherwise served by a plan shall to the extent legally permissible be administered by such plan and to that end this corporation shall, where legally permissible appoint each plan or its chief salaried executive officer as its only agent or agents in said territory

Comments—Under the Blue Cross Blue Shield Health Service Inc, there would be one corporation which would provide excess coverage for employes who are members in local plans for both hospital and medical care

Under this arrangement, overutilization for hospital benefits would be made up from premium income received for the excess coverage providing medical care benefits Conversely, the same would apply for overutilization in medical care benefits.

The one corporation idea is contrary to the method and principles of the present hospital and medical care plans now operating in New York State, which retain within their own control the rights and privileges to make changes in contract benefits policies rates etc

Due to the steadily increasing rise in hospital costs and the possibility that subsidies may have to be obtained to meet these costs either by local taxation or grants from the State or Federal government, it is advisable to establish two corporations namely one hospital and one medical in order that the medical plan would be entirely independent of any dictation from a State or Federal level regarding its policies. Also the medical profession would be in control of the establishment of fee schedules which would apply to the excess coverage offered.

Under the proposed Health Service Inc. benefits could be offered only on an indemnity basis. However if through negotiations with a national account service benefits were demanded it would then be entirely up to the willingness of local physicians to accept the indemnity schedule in full payment for their services.

It is perhaps difficult to determine what excess coverage national accounts would demand through bargaining agreement with unions In the event a complete medical care program is negotiated excess coverage would be administered by the local plan in addition to its established benefits. From an administrative point of view, it would be reasonable to anticipate that where house and office calls are provided administrative functions in claims would increase many times as compared to the incident of demand under the local plan This would automatically increase the administrative costs of each plan unless they are reimbursed by the Health Service, Inc., for these services.

The principle and purpose upon which medical care plans were organized were for community service organizations Would not a plan be criticized for discriminating against subscribers who were not employes of national accounts by offering to a preferred group excess benefits which would not be available to local subscribers?

In order to establish the Health Service Inc, it is necessary for the plans to contribute $500 000 and, being nonprofit corporations subject to the New York State Insurance Department regulations I believe that before a commitment could be made, a definite ruling regarding a contribution for the purchase of stock should be obtained from the Commissioner of Insurance.

Dr Wertz chairman, stated that there would be a meeting the same afternoon of the Subcommittee on Medical Expense Insurance at which the proposal of the Blue Cross-Blue Shield Association and the Blue Cross-Blue Shield Health Service Inc would be discussed.

Because of the statement from the Council on Medical Service of the American Medical Association, he recommended that the Council of the State Society recommend to our Subcommittee to go on record not to do anything in regard to this until the House of Delegates of the American Medical Association has taken action on these proposals He thought it very important the Council take such action today because the matter is coming up at French Lick on the 25th of this month

After discussion, *it was voted* that the Council second the report of the Council on Medical Service of the American Medical Association and that they oppose the formation of a national health insurance company under the auspices or direction of Blue Cross-Blue Shield and that the Subcommittee on Medical Expense Insurance be so informed and given power to notify all of the medical plans in New York State to that effect

Dr Wertz brought up the matter of the medical services being promoted by Blue Cross contracts and which may be enlarged In a recent opinion of Attorney-General N Goldstein, he states that in his opinion the Blue Cross, that is, the hospital service people, can provide medical services, such as x-ray, anesthesia, physical therapy, and pathology and include them in their contracts Dr Wertz thought this ruling would have a very serious effect on the practice of medicine in the State of New York He had consulted with Judge Piper who was the head of a committee which rewrote the insurance law and was told that he did not agree with Attorney-General Goldstein's opinion

Dr Masterson stated that the Joint Council of Radiologists, Pathologists, Anesthesiologists, and Physical Therapy physicians carried this matter originally to the State Insurance Department They hired Mr Sherpick, a member of the Bar, and he understood that they intend to appeal this decision in the courts If they do, he thought the State Society should cooperate with them

After discussion, *it was voted* to refer this matter to the Planning Committee for Medical Policies for study and report

Finance Committee—Dr Andresen, chairman, presented the tentative budget for 1949, with detailed explanations

It was voted that the budget be adopted and referred to the Board of Trustees for their approval

Malpractice Insurance and Defense Board.—Dr Jonas Borak was granted the privilege of appearing before the Council to ask for a revision of the decision of the Malpractice Insurance and Defense Board not to grant him malpractice defense insurance

Dr Borak presented his case, and Dr D'Angelo spoke on behalf of the Malpractice Insurance and Defense Board

After discussion, *it was voted* to refer the matter back to the Malpractice Insurance and Defense Board for further consideration with the suggestion that Dr Borak appear before the Special Advisory Radiology Subcommittee

Dr Leo F Schiff, chairman, sent the following report under date of October 6, 1948, which was read by Dr Anderton

Acknowledgment is made of receipt of a letter from Dr Anderton referring back to this Board for 'clarification and more specific recommendations" the recommendation previously made by this Board, will not occur until October 20, and the matter was felt to be of sufficient importance to warrant presenting it to the Council at the meeting of October 14, a telephone referendum of the Board was carried out, the results of which are herewith recorded

The Board is in unanimous agreement on the following points

1 The Alameda County Plan has apparently achieved considerable success in reducing the number and cost of malpractice actions principally through the activation of a realistic program of public relations The term "public relations" is here used in a sense differing considerably from the concept of "public relations" as carried out by State and county society committees in this State It attempts to reach the public, not so much through committee-sponsored publicity as it does through encouraging the individual physician to promote better patient-physician relationship, to observe more rigidly the principles of medical ethics, and to reduce to a minimum all cause for dissatisfaction and complaint by patients It has, for example, induced the physicians in several communities to formulate programs whereby patients in need of medical attendance in emergencies, and particularly at night, do not have to telephone through a long list of physicians before they receive attention Local grievance committees have ironed out many difficulties and forestalled legal actions It is obvious that any attempt to carry out a similar plan in this State would require careful study and would involve considerable revamping of our present public relations program

2 Time is an important factor At the present we are faced with an acceleration of the upward trend of malpractice suits and claims in this State

3 A study of the plan through correspondence at long range would be time-consuming, and not nearly so efficient as an on-the-spot study by representatives of this Society For these reasons your Board again recommends that a committee be authorized to visit Alameda and neighboring counties in California for the purpose of securing full information as to the scope, method of operation, and success of the plan, together with the reaction of members of the Medical Society and others in that section We feel that such a study will be much more fruitful if carried out by a committee representing the various activities involved rather than by one individual, and recommend that such a committee be composed of

(*a*) The Secretary of this Board because of his technical knowledge of the insurance situation

(*b*) A medical member of this Board who can study the plan from the doctor's point of view, yet with some special knowledge of the malpractice situation

(*c*) A member of the State Society to represent Public Relations in the sense hereinabove given to the term

(*d*) The legal counsel of this Society, or his representative, to study the situation from a legal point of view, since the laws of California and their application to malpractice may have some important bearing on the situation in that state

4 We estimate that the study can be completed within a week Therefore, a proposed budget for such a committee would include the travel expense to California and return and maintenance in California for one week for each member of whatever committee may be so appointed

THESODATE

Brewer's

The ORIGINAL ENTERIC COATED TABLET OF THEOBROMINE SODIUM ACETATE

Now Available

IN AN ADDITIONAL POTENCY

to meet the requirements and requests of many physicians

THE NEW STRENGTH – 7½ gr enteric coated green tablets with ¼ gr phenobarbital, has been formulated for physicians wishing to prescribe the same effective amount of Theobromine Sodium Acetate, but with less amount of sedative.

Complete List of Potencies—

THESODATE
(7½ gr.) 0.5 Gm * or (3¾ gr.) 0.25 Gm.*

THESODATE WITH PHENOBARBITAL
(7½ gr.) 0.5 Gm with (¼ gr.) 30 mg *
(7½ gr.) 0.5 Gm with (⅛ gr.) 15 mg
(3¾ gr.) 0.25 Gm. with (⅛ gr.) 15 mg *

THESODATE, POTASSIUM IODIDE, PHENOBARBITAL
(5 gr.) 0.3 Gm (2 gr.) 0.12 Gm (⅛ gr.) 15 mg

* Supplied also in capsules (not enteric coated) for supplementary medication

PROVIDES A WIDE RANGE OF AN EFFECTIVE MEDIUM FOR TREATMENT IN CORONARY DISEASE.

For literature and samples write to Sales and Service Dept.

[Continued from page 2748]

taken at all, it should be done thoroughly and promptly and that the advantages, financial and professional, to be gained from such a program if it can be successfully applied in this State warrant the expenditure suggested We again point out the urgency in consideration of this matter and request that any action taken by the Council at the meeting of October 14 requiring any further consideration by this Board be communicated to the secretary of this Board in time for presentation at the meeting which will be held on October 20

After discussion, *it was voted* that the report be approved with the amendment that two members only, the Secretary and one medical member, be authorized to go to California instead of four

After discussion, *it was voted* that the Council recommend to the Board of Trustees a special appropriation not to exceed $1,500 to defray the expenses of two members of the Malpractice Insurance and Defense Board to visit the Alameda County Medical Society (California) to study methods of reducing incidence of malpractice insurance defense cases

Medical Service —Dr Wertz reported that letters were being sent to constituent county societies requesting nominees for the outstanding general practitioner of the year, the selection to be made at the Interim Session of the American Medical Association He requested advice as to what method to use in choosing a nominee from New York State

It was voted that the Medical Service Committee screen county society recommendations and submit three nominees to the Council next month, with their records and credentials

It was voted that the Council would then select one candidate to be submitted to the trustees of the American Medical Association

Planning Committee for Medical Policies —Dr Kenney, chairman, reported progress

Public Health and Education

The report as distributed with the agenda is as follows

Activities of the Chairman

September 15 In Pomona, New York, to attend the meeting of the Council Committee on Public Health and Education and the Subcommittee on Geriatrics

October 13 In New York City attended a meeting of the Council Committee on Public Health and Education and the Subcommittee on Cancer Also present at this meeting were some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health A verbal report of this meeting will be made to the Council by the Committee chairman

Subcommittee on Geriatrics —The following report was submitted by Stephen R Monteith, chairman

A meeting of the Subcommittee on Geriatrics was held at Summit Park Sanitorium, Pomona, on Wednesday, September 15, 1948 Present were Drs Scott Lord Smith, C Ward Crampton, Stephen R. Monteith, and O W H Mitchell

Review was made of the Committee's report to the House of Delegates and it was considered proper at this time to formulate plans and urge legislation concerning some of the matters recommended in the report, if such plans meet with the approval of the Council

Nursing Homes —The Committee feels, in the matter of care of the chronically ill, that what progress as is possible at present is being made in developing hospital facilities for the chronically ill At least stimulation to concerted effort in this direction appears to be developing

In order to fulfill requirements at the nursing home level your committee feels that the very first step should be the enactment of legislation embodying the licensing of nursing homes and standardization of their construction, equipment, and staffing

Practical Nursing —In close relationship with development of nursing homes and the recent idea of supplying nursing service in the home under hospital direction is the shortage of help, both nursing and technical

Your Study Committee feels that possibly legislation stimulating or subsidizing training programs in the fields just mentioned might be helpful in eventual solution of the personnel problems involved, particularly in the practical nurse training programs now developing in the Department of Education

Medical Research Council —Your Study Committee feels strongly that research in various chronic diseases should be one of the prime objectives of all medical schools and of the appropriate research bureaus of the Department of Health of the State of New York We believe that such research will, of necessity, be of varied kinds, and many projects will be of long duration The creation of a Medical Research Council to coordinate and subsidize these various projects would seem to lead to economy both of effort and of funds Your Committee would recommend introduction of legislation, if needed, to create such a council

Health Record —For the reasons set forth in its former report, the Subcommittee on Geriatrics believes the continuing Health Record could make a valuable contribution to the eventual solution of some of the problems of geriatric medicine Therefore, we should like to urge study of such a scheme by the Department of Health and the Division of Vital Statistics

Subcommittee on Blood Banks —Lester J Unger, chairman, reported as follows

A meeting of the Council Committee on Public Health and Education and the Subcommittee on Blood Banks was held in New York City on September 16, 1948 Also present at this meeting were some of the officers of the Medical Society of the State of New York and representatives of the State Department of Health and the American Red Cross A report of this meeting was made at the Council meeting by your chairman

Postgraduate Instruction —Postgraduate instruction has been completed in the following counties Allegany, Cayuga, Otsego, and Steuben

Since the September report of the Council Committee on Public Health and Education, the committee has arranged for postgraduate instruction for the following counties Columbia, Fulton, Jefferson, Ontario, St Lawrence, Schenectady, Suffolk, and Ulster

Postgraduate instruction is being planned in the following counties Monroe, Onondaga, Orange, Richmond, Schoharie, Sullivan, and Tompkins

Requests for instruction have been received from the Clinton County Medical Society and the Glens Falls Academy of Medicine These arrangements are incomplete

The material for the 1948-1949 Course Outline Book has been sent to the printer and we hope to have it ready for mailing within three or four weeks

Cancer —Dr Mitchell stated that their committee was contemplating preparation of a Cancer

Low INCIDENCE OF COMPLICATIONS

MONÓCAINE FORMATE* *for spinal anesthesia*

Anesthetists who have been using Monócaine Formate consistently for subarachnoid anesthesia report several advantages demonstrated by this spinal anesthetic.

A recent clinical report covering 2230 clinical spinal anesthesias in which Monócaine Formate was employed suggests that operative and post-operative complications following Monócaine spinal anesthesia were of low incidence This report also indicated that Monócaine Formate induces rapid anesthesia and anesthesia of long duration sufficient for the average operation

Manual of about 160 to 200 pages It would be issued in the name of the Medical Society of the State of New York and the New York State Department of Health, and it is contemplated that the State Department of Health would bear the cost of distribution to all doctors in the State Details are being perfected and will be reported later

Medical Moving Picture Review Board—Dr Mitchell stated that the new Course Outline Book will carry announcements that the American Medical Association and the New York State Department of Health have medical moving pictures available for teaching purposes without cost to medical societies As there are many films, Dr Mitchell requested that a review board be appointed to select ones best adapted for postgraduate education in our Society

After discussion, *it was voted* that a Motion Picture Review Board be appointed by the President, when, as, and if necessary

Diabetes—Dr Mitchell stated that he had received considerable literature dealing with increasing activities for the detection of diabetes It is roughly estimated there are about 1,000,000 diabetics in the United States of America who are known and perhaps the same number not known The American Diabetes Association is proposing a public drive for the detection of diabetes Dr Mitchell stated that we are in sympathy with and approve in principle such a plan, but its actual operation should be left to the individual county societies

It was voted that the American Diabetes Association be informed that the Medical Society of the State of New York is sympathetic with and approves the detection plan in principle but that the actual operation of it should be adjusted with the individual county medical societies

Public Relations—Dr Winslow, chairman, submitted the following report

The major portion of the Public Relations Bureau's activities during the last month were concerned with district branch meetings Advance releases were sent to the daily papers and wire services in the various districts together with excerpts of the addresses made by Dr Leo F Simpson, president, and Dr John J Masterson, president-elect Mr Anderson attended each of the district branch meetings held to date Mr Miebach attended the meetings of the Fifth, Sixth, Seventh and Eighth District Branches Mr Walsh attended those of the Third and Fourth Districts and will attend the Second and First District Branch Meetings

Clippings from the State press received by the Public Relations Bureau show that the district branch meetings were well publicized in advance and that they also received excellent follow-up stories in the cities where the meetings were held

On September 2, Mr William F Doscher, assistant public relations director of the American Medical Association, visited the Public Relations Bureau for the purpose of becoming acquainted with the activities of the New York Society His visit furnished an opportunity to discuss various ways in which the public relations activities of the State Society and those of the American Medical Association might be more closely coordinated.

On September 21, the Public Relations Bureau issued a news release on behalf of the Bureau of Medical Care Insurance setting forth the growth of the six voluntary nonprofit medical care plans in New York State during the first half of 1948

The following postgraduate sessions held under the auspices of the Committee on Public Health and Education were covered by releases to the press Allegany, Fulton, Orange, and Otsego

Letters were prepared for the president of Veterans Medical Care Plan and sent to the New York State commanders of all veterans' organizations Among the replies received was one stating that the commander thoroughly endorses the Society's efforts in behalf of veterans suffering from service-connected disabilities Conferences were held with Dr O'Kane, the coordinator, and Dr Crane and Dr Pettit of Richmond County on the content of the resolution passed by the Richmond County Department of the American Legion These conferences resulted in the appointment by the president of the Richmond County Society of a committee to meet with the veterans' organizations in that county as a preliminary to having these service organizations call upon the Veterans Administration to appoint a coordinator on Staten Island so that the hardship encountered by veterans traveling back and forth from the Veterans Administration Clinic in New York may be eliminated

On an invitation from the president of the Woman's Auxiliary, Mr Walsh spoke at a meeting of the Executive Board and at the Auxiliary's Third and Fourth District Meetings He also assisted the senior counselor and the State chairmen of the program, public relations, legislative, press and and publicity, and the fact-finding committees in the preparation and distribution of their 1948 programs

A 23-page draft of a proposed manual for county legislative chairmen and committee members has been prepared and submitted to the Executive Officer for review This manual explains the functions of the county legislative committees and how they can best cooperate with the State Society

Veterans Administration, Liaison with the—Dr Bauckus, chairman, reported verbally as follows

Thank you, Mr President, and members of the Council, for inviting me to report at this meeting I have not reported to you since June, although you have had discussion on this subject at the House of Delegates' meeting I just have a very few statistics I think you should hear in order to improve acquaintance with the situation This is from the Office Report of the Department of Medicine and Surgery, Branch 2, Veterans Administration, Report of Progress, July, 1947–June, 1948

Where VA clinics were not feasibly available, outpatient care of eligible veterans was performed under the Home Town Medical Care Plan During fiscal year 1948, 98,609 veterans were treated by private physicians under this plan, at a cost of $2,582,761 to the VA About 59 per cent of all VA outpatient medical care in the State was performed by non-VA physicians

Under a similar arrangement with private dentists, 95 per cent of all dental care rendered during the year was performed by non-VA dentists, 94,238 treatments and 64,279 examinations were authorized to fee basis dentists and were completed at a cost of $7,688,016 to the VA.

There is one other item, to give you an idea of what is being spent in New York State

During the fiscal year, a little less than $50,000,000 was spent in New York State directly or indirectly for providing medical care for veterans This figure represents about eight per cent of total expenditures by the VA in New York State,

[Continued from page 2752]

which amounted to about $600,000,000 for the fiscal year These figures are exclusive of the cost of new hospital construction, which are not included in the branch budget

I would like to comment on the reason that I think the expenditures for dental care are much higher than for medical care, and, by the way, the total amount of money for dentists was $7,688,016 compared to $2,582,761 for medical care under our Home Town Care Plan I think that most of the care being done privately by dentists was due to the fact that the VA had difficulty in employing dentists on a full-time or part-time basis as well as difficulty in getting equipment for them, but it was comparatively easy for them to employ part-time and full-time physicians

While I am on that subject, our troubles have not been with the full-time physician but have been with the part-time physician whom they can very easily get

In the hospitals, reference is made to the high quality of care and I assume it is so They use this argument that the Deans' Committee have much to say about the staffs of hospitals and what they have done, therefore, everything is fine Some men have accepted positions because in the hospitals they are now able to get credit for their national specialty boards and some of these men say they have gone into the service because they could not get such credit rating in any other way It seems to me that part of the Hippocratic oath relating to teaching applied first In that oath is comprehended the fact that some men are very anxious to get into some veterans' hospital in some capacity because the Deans' Committee has something to do with it

Under date of October 9 in the *Journal of the American Medical Association* there is a little item which I think you should hear

NONSERVICE-CONNECTED DISABILITIES

In a summary of its activities as of August 31, 1948 the Veterans Administration reported a total of 105,048 patients in hospitals of the 92 983 in veterans administration hospitals 61 091 were veterans with nonservice-connected disabilities, of the 12 065 patients not in veterans administration hospitals 7 488 were veterans with nonservice-connected disabilities In addition there were 14 342 beneficiaries in Veterans Administration homes

Eighty-nine new hospitals were in progress at the end of August of which the construction contracts had been awarded for 28 the designs were in progress in 50 the designs not started in three and the designs completed but construction contracts not awarded in eight Through the end of the month, 63 sites have been acquired for new veterans hospitals, 20 specific sites have been approved but not acquired seven specific sites were in the process of selection furthermore 31 additions and conversions to the hospital addition and conversion program had been completed throughout the month, and 17 other additions and conversions were in progress

At the end of August, 18 560 veterans were awaiting hospital admission of these 18 490 had disabilities adjudicated nonservice-connected, 77,277 applications for hospital or domiciliary care were received through the month and 33 679 applications were filed for automobiles for disabled veterans.

That should illustrate to you the huge program that may be anticipated for the future in these hospitals, and, as I read to you, a great many of them have not even been designed, to say nothing of beginning them In this matter, by the way, the American Hospital Association is very much with the medical profession in seeking to curb the erection of unnecessary hospitals Now is the time when the Hospital Association seems to be willing to go along with us

There are just two additional items, and then will stop They are quite important, however, and I think may require action by the Council We had a joint meeting yesterday of the Board of Directors of the Veterans Medical Service Plan of New York Inc , and our Liaison Committee with the Veterans Administration We discussed two main items One is the question of the renewal of the contract of Veterans Medical Service Plan of New York Inc , with the Veterans Administration We, as you know, renewed the contract with them which expired June 30, 1948, for three months We had some difficulty about that because the authorities in Washington, although I think in the New York Branch area too, wanted to discontinue the supervision of the State Medical Society by the removal of the coordinators We objected As you know the Veterans Administration furnishes the funds for the State Medical Society to pay these coordinators The expiration date was September 30, 1948

In the middle of September, I met Dr Butler in New York City, where he is the branch director, to discuss the question of contract renewals He proposed that the same contract be continued for another three months There is much uncertainty about future plans of course on account of the election However, he stated also that Mr Gray, the new director of the Veterans Administration, was making a survey and study throughout the country and until that was completed it would not be known what changes they might want Therefore, I wrote to the Board of Directors and secured their written vote to prolong the existing contract again for three months

We ought to have a longer contract than that Yesterday the Board of Directors and Committee advocated a year

If you recall, the House of Delegates stated that any new contract made with the Veterans Administration should ask for or insist upon the free choice of physician and hospital wherever possible, and there was some question as to whether we ought to insist upon a more strict conformation to that principle in a new contract However, after all it depends on what they want to do in the various branches as far as the free choice is concerned, and it seemed that would be possible under the old contract Therefore, we decided yesterday to recommend that we engage in a renewal of the contract for one year, and I think the Liaison Committee and the Board of Directors of the Plan, too, would like to have Council approve that item

The other question relates also to a House of Delegates' mandate that we meet (a committee of the Medical Society of the State of New York) with the representatives of veterans' organizations I think that important meeting will take place soon The President, I hope, can arrange that this committee, chosen by him, which is composed of the Board of Directors of the Veterans Medical Service Plan, and I think the Liaison Committee, should be the committee to meet with representatives of veterans' organizations That should be done this fall

It was voted that in view of the fact that the chairman of the Liaison Committee felt that the renewal of the contract was in accord with the motion of the House of Delegates his action be approved

It was voted that the President arrange that the committees of the Medical Society of the State of New York meet with representatives of veterans organizations as mandated by the House of Delegates some time soon

War Memorial

It was voted that the Council recommend to the Board of Trustees that the expenses for the War Memorial be allocated from the general finances of the Society

Woman's Auxiliary —Dr Beekman, chairman of Advisory Committee, read the following letter written by the Secretary of the American Medical Association to Dr Anderton

September 14, 1948

TO THE SECRETARIES OF THE CONSTITUENT STATE MEDICAL ASSOCIATIONS

For your information as secretary of your constituent state medical association I am transmitting herewith the following resolution on Funds to Defray Expenses of Woman's Auxiliaries of State Medical Associations which was adopted by the House of Delegates of the American Medical Association at its annual session recently held in Chicago This resolution was introduced in the House by a delegate representing the Oregon State Medical Society

WHEREAS our local state and national woman s auxiliaries have become an indispensable adjunct of organized medicine and

WHEREAS the local state and national auxiliaries are especially effective as agencies for furthering the education of the public concerning the aims and accomplishments of scientific medicine and

WHEREAS their maximum effectiveness requires participation by the wife of every member and sufficient funds to enable them to carry on their essential activities therefore be it

Resolved that each constituent state medical association be urged to budget sufficient funds to defray the cost of the activities of its auxiliary and to pay the annual dues of the national auxiliary thus making the wife of every member automatically a member of the state and national auxiliaries and eliminating the collection of state and national auxiliary dues from individual auxiliary members.

Very sincerely yours
George F Lull

Dr Beekman felt if this was done they would no longer be a voluntary organization The Society allows the Woman's Auxiliary an appropriation of $2,000 per year with no strings attached He stated that the Auxiliary was very active Mrs Neptune, the president, has attended all the District Branch meetings to date, the ladies expecting to raise their dues from 75 cents to a dollar a year They have also asked to be supplied with secretarial help and some place to put their filing cabinets

Workmen's Compensation —Dr Kenney, chairman, submitted the following report as distributed with the agenda

New Fee Schedule —Thus far we have received a very large number of inquiries concerning the applicability of certain fees A number of questions have been posed concerning certain items, e g , the fee to be paid to specialists in surgery (S4) for the first treatment The fee schedule calls for a fee of $15 for complete examination or consultation in the office and a subsequent fee of $5 00 for office treatments The question, whether the $15 fee applies to *all* first visits regardless of whether the patient is a referred patient or consultation or just an ordinary patient which the surgeon elects to treat, is a moot one We have conferred with the chairman of the Advisory Committee and with other members of the Committee as to their interpretation of this item and have also written to the chairman of the Workmen's Compensation Board and in her absence have conferred with the secretary of the Board

There seems to be considerable doubt as to whether the $15 fee is to apply for ordinary first treatments In order to clarify this point and other questions which have arisen, we have strongly recommended a hearing by the chairman of the Workmen's Compensation Board at the earliest possible moment so that these doubtful points may be clarified

There are numerous other questions concerning fees which should be considered at the same time We have already drawn to the attention of the secretary of the Board certain errors and omissions in the fee schedule, notably the failure to provide a fee for XE practitioners and the failure to include the complete schedule for multiple x-ray examinations in the new booklet Under the old schedule partial specialists were paid full fees for operative work but lesser fees than full specialists for office and other calls or visits This should apply to the new schedule

One very important question which has arisen is whether a patient injured before September 1, but not treated until September 1 or after, calls for a fee under the new schedule or under the old one It seems the consensus of opinion, not officially verified, that the new schedule would apply in all cases not treated until September 1 or subsequently, even though the injury was sustained before September 1 This is the equivalent of the old cases reopened after September 1 where the case is not treated until or subsequent to September 1 One of the lay members of the Committee expressed the opinion that the new fees were to apply even were the patient treated by a general practitioner prior to September 1 and then referred for specialistic care or surgery after September 1 Inasmuch as the schedule calls for a fee of $5 00 for all subsequent treatments by specialists, the chief question to be resolved is whether the full specialist fee is to apply for the first treatment

It seems to be the consensus of opinion of those surgeons with whom we have spoken that a fee somewhat in excess of $5 00, but not $15, should be paid to the specialist in surgery for all first treatments, and not the general practitioner's fee of $3 50 for first treatments Perhaps a fee of $7 00 or $7 50 might be agreed upon as an adequate fee, or a fee of $10 for all first visits not referred by a general practitioner to the specialist

In line with the recommendations of the House of Delegates we should recommend that there be a revision of the fee schedule at the expiration of one year from the date of its promulgation Special attention should be given at that time to such revisions as are deemed necessary but particularly to the fees paid for x-ray examination which have not been increased in the present schedule The fees for specialists in physical therapy are also inadequate

At the last meeting of the Council, Dr Walter P Anderton reported the receipt of a letter from Dr Francis M Conway, chairman of the Medical Practice Committee, concerning the advisability of having more frequent revisions of the fee schedule based upon some economic yardstick which might be applied in accordance with the upward and downward swing of the cost of living We enclose herewith a memorandum based upon the research of Dr Frank G Dickinson, director of the Bureau of Medical Economic Research of the American Medical Association, as to the comparative increase in the cost of medical care and in the cost of living This might serve as a basis for determining the relationship between medical fees in effect and the actual cost of living as estimated through the United States Bureau of Labor Statistics The entire question of future changes in the Workmen s Compensation fee schedule was referred to the

War Memorial

It was voted that the Council recommend to the Board of Trustees that the expenses for the War Memorial be allocated from the general finances of the Society

Woman's Auxiliary —Dr Beekman, chairman of Advisory Committee, read the following letter written by the Secretary of the American Medical Association to Dr Anderton

September 14, 1948

TO THE SECRETARIES OF THE CONSTITUENT STATE MEDICAL ASSOCIATIONS

For your information as secretary of your constituent state medical association I am transmitting herewith the following resolution on Funds to Defray Expenses of Woman's Auxiliaries of State Medical Associations which was adopted by the House of Delegates of the American Medical Association at its annual session recently held in Chicago This resolution was introduced in the House by a delegate representing the Oregon State Medical Society

WHEREAS our local state, and national woman s auxiliaries have become an indispensable adjunct of organized medicine and

WHEREAS the local, state, and national auxiliaries are especially effective as agencies for furthering the education of the public concerning the aims and accomplishments of scientific medicine and

WHEREAS, their maximum effectiveness requires participation by the wife of every member and sufficient funds to enable them to carry on their essential activities therefore be it

Resolved that each constituent state medical association be urged to budget sufficient funds to defray the cost of the activities of its auxiliary and to pay the annual dues of the national auxiliary, thus making the wife of every member automatically a member of the state and national auxiliaries and eliminating the collection of state and national auxiliary dues from individual auxiliary members

Very sincerely yours
George F Lull

Dr Beekman felt if this was done they would no longer be a voluntary organization The Society allows the Woman's Auxiliary an appropriation of $2,000 per year with no strings attached He stated that the Auxiliary was very active Mrs Neptune, the president, has attended all the District Branch meetings to date, the ladies expecting to raise their dues from 75 cents to a dollar a year They have also asked to be supplied with secretarial help and some place to put their filing cabinets

Workmen's Compensation —Dr Kenney, chairman, submitted the following report as distributed with the agenda

New Fee Schedule —Thus far we have received a very large number of inquiries concerning the applicability of certain fees A number of questions have been posed concerning certain items, e g , the fee to be paid to specialists in surgery (SA) for the first treatment The fee schedule calls for a fee of $15 for complete examination or consultation in the office and a subsequent fee of $5 00 for office treatments The question, whether the $15 fee applies to *all* first visits regardless of whether the patient is a referred patient or consultation or just an ordinary patient which the surgeon elects to treat, is a moot one We have conferred with the chairman of the Advisory Committee and with other members of the Committee as to their interpretation of this item and have also written to the chairman of the Workmen's Compensation Board and in her absence have conferred with the secretary of the Board

There seems to be considerable doubt as to whether the $15 fee is to apply for ordinary first treatments In order to clarify this point and other questions which have arisen, we have strongly recommended a hearing by the chairman of the Workmen's Compensation Board at the earliest possible moment so that these doubtful points may be clarified

There are numerous other questions concerning fees which should be considered at the same time We have already drawn to the attention of the secretary of the Board certain errors and omissions in the fee schedule, notably the failure to provide a fee for XE practitioners and the failure to include the complete schedule for multiple x-ray examinations in the new booklet Under the old schedule partial specialists were paid full fees for operative work but lesser fees than full specialists for office and other calls or visits This should apply to the new schedule

One very important question which has arisen is whether a patient injured before September 1, but not treated until September 1 or after, calls for a fee under the new schedule or under the old one It seems the consensus of opinion, not officially verified, that the new schedule would apply in all cases not treated until September 1 or subsequently, even though the injury was sustained before September 1 This is the equivalent of the old cases reopened after September 1 where the case is not treated until or subsequent to September 1 One of the lay members of the Committee expressed the opinion that the new fees were to apply even were the patient treated by a general practitioner prior to September 1 and then referred for specialistic care or surgery after September 1 Inasmuch as the schedule calls for a fee of $5 00 for all subsequent treatments by specialists, the chief question to be resolved is whether the full specialist fee is to apply for the first treatment

It seems to be the consensus of opinion of those surgeons with whom we have spoken that a fee somewhat in excess of $5 00, but not $15, should be paid to the specialist in surgery for all first treatments, and not the general practitioner's fee of $3 50 for first treatments Perhaps a fee of $7 00 or $7 50 might be agreed upon as an adequate fee, or a fee of $10 for all first visits not referred by a general practitioner to the specialist

In line with the recommendations of the House of Delegates we should recommend that there be a revision of the fee schedule at the expiration of one year from the date of its promulgation Special attention should be given at that time to such revisions as are deemed necessary but particularly to the fees paid for x-ray examination which have not been increased in the present schedule The fees for specialists in physical therapy are also inadequate

At the last meeting of the Council, Dr Walter P Anderton reported the receipt of a letter from Dr Francis M Conway, chairman of the Medical Practice Committee, concerning the advisability of having more frequent revisions of the fee schedule based upon some economic yardstick which might be applied in accordance with the upward and downward swing of the cost of living We enclose herewith a memorandum based upon the research of Dr Frank G Dickinson, director of the Bureau of Medical Economic Research of the American Medical Association, as to the comparative increase in the cost of medical care and in the cost of living This might serve as a basis for determining the relationship between medical fees in effect and the actual cost of living as estimated through the United States Bureau of Labor Statistics The entire question of future changes in the Workmen's Compensation fee schedule was referred to the

Appointments—Dr Aranow, chairman of the Legislative Committee being seriously ill, the president, Dr Simpson, requested and *was voted* approval of the appointment of Dr Frederic W Holcomb of Kingston as acting chairman of the Legislative Committee

Elections—Dr Dan Mellen of Rome was elected trustee to fill the vacancy left by the death of Dr Albert A Gartner

Dr Frederic W Holcomb of Kingston was elected Councilor to fill the unexpired term of Dr Dan Mellen

World Medical Association—Dr Bauer made the following verbal report

As most of you know, I got back from Geneva about three weeks ago, where I attended the Second Annual Meeting of the World Medical Association There is a report of the highlights of that meeting on page 436 of the *Journal of the American Medical Association* for October 9 I hope you will read it, but there is one item that I would like to read to you, and I think it is particularly important There were 29 nations represented there, and, surprising as it may seem from these nations coming from all over the world and speaking different languages, these resolutions were adopted unanimously, and I think you will agree that we could very well have written them ourselves They spent nearly a day and a half in discussing the social security and health insurance, because that is a very important factor in their lives They all have it, and they all wish they did not have it They would like to do something to protect what little freedom they have left and, if possible, to get some back that they have lost These are the 12 principles which they adopted, and they were adopted only as being essential if social security includes medical care

(*a*) Freedom of choice of physician by the patient Liberty of physician to choose patient except in cases of urgency or humanitarianism

(*b*) No intervention of third party between physician and patient

(*c*) Where medical service is to be submitted to control, this control should be exercised by physicians

(*d*) Freedom of choice of hospital by patient

(*e*) Freedom of the physician to choose the location and type of his practice

(*f*) No restriction of medication or mode of treatment by physician except in case of abuse

(*g*) Appropriate representation of medical profession in every official body dealing with medical care

(*h*) It is not in the public interest that physicians should be full-time salaried servants of the government or social security bodies

(*i*) Remuneration of medical services ought not to depend directly on the financial condition of the insurance organization

(*j*) Any social security or insurance plan must be open to the participation of any licensed physician, and no physician should be compelled to participate if he does not wish to do so

(*k*) Compulsory health insurance plans should cover only those persons who are unable to make their own arrangements for medical care

(*l*) There shall be no exploitation of the physician, the physician's services, or the public by any person or organization

I do not think we could quarrel very much with those The surprising thing, I think, is that that represents the views of representatives from 29 different nations, including one of them from behind the Iron Curtain if you please, Bulgaria, and they were adopted without a dissenting vote Most of the day and a half's argument was not on the principles but on language, because it is difficult to translate a word into another language and have it mean exactly the same thing I, personally, think that if the World Medical Association had not accomplished anything else—and I think it did—this certainly justifies its existence, and I think it is deserving of support

If any of you perhaps saw the editorial which appeared in the *Journal of the American Medical Association*, I think two or three weeks ago, urging state and county societies and national organizations to become supporting members of the United States Committee of the World Medical Association, I wish to talk on that

As you know, the income of the World Medical Association itself is infinitesimal in that it gets only dues from member associations, many of whom are broke, and, if they are not, they cannot pay their dues because they cannot get their money out of the country We had, up until last April, three bank accounts, one in Zurich, one in Paris, and one in England The money in France and England can only be spent in those countries, because they cannot get it out, so we established a new one in New York in April, to which our own dues (the American Medical Association's dues) and the dues of the Canadian and some of the Latin American countries are being paid in dollars here in New York, and where of course we can use it, but even so the income is altogether too little, so that the United States Committee was formed to raise money really to support this thing in the way it should be run One of the strings attached to that offer was that the headquarters of the organization were going to be located in the United States We said North America, but they picked the United States, and that was agreed to, and we have agreed to underwrite the expenses of the Secretariat and the traveling expenses of members of the Council We first thought that it would be done on $50,000 a year Now we know that that is not adequate, it is going to cost $75,000 to $100,000 a year The American Medical Association, the Mayo Clinic, the International College of Surgeons have each contributed $2,000 a year toward the support of this Many of the national organizations have contributed The National Foundation for Infantile Paralysis and the American Red Cross have each contributed $5,000 The Pfeiffer Foundation contributed $10,000, and a number of others

Having just passed a budget for next year of $290,000, I am reluctant to ask the State Society to go into it in any great degree, but I note in the budget the Trustees last April appropriated $500 for entertainment of the Council when it was here in April, and that there is $161 of that unspent, so I was wondering if for this year the Council would be willing to recommend to the Trustees that $150 of that amount which has already been appropriated for this year and is in the budget be given to the United States Committee as a membership of this Society

It was voted that the Council recommend to the Trustees that $150 of the amount previously appropriated for this year and in the budget, be given to the United States Committee as a membership of this Society
